The H. J. Koehler S. G. Company, New York City, distributor for Koehler machines, recently shipped five of these vehicles to West Africa. It is understood that the purchase was a sample order, and that others are contemplated for use on the veldts.

The first electric wagon used in the Philippines was a G. V., made by the General Vehicle Company, Long Island City, N. Y. This company is now producing 16 machines of differing capacities, which will be sent to the islands in the near future. This consignment will increase the total of G. V. machines in use there to 39.

A three-ton Packard truck, made by the Packard Motor Car Company, Detroit, is employed near Asheville, N. C., in hauling building materials for a new tourist hotel. The mountain stones are loaded on a motor train of 15 wagons, which are hauled by the truck to the site of the structure three miles distant. In this work the Packard is replacing 15 pairs of horses or mules.

A three-ton KisselKar truck, made by the Kissel Motor Car Company, Hartford, Wis., and owned by an express and teaming contractor in Chicago, recently transported a 5500-pound load of household effects from the latter city to Milwaukee, Wis., and returned home in an actual running time for the round trip of 36 hours. The owner of the goods declares he saved between $40 and $50, besides the added advantage of having his goods

Dow Dual Wheel Equipment on Five-Ton Mack Truck.

handled but once at each end of the line. The distance was practically 100 miles, and the roads were rough and snow blocked in places.

A local trucking contractor in San Francisco, Cal., has been utilizing a Knox-Martin tractor, made by the Knox Automobile Company, Springfield, Mass., replacing 10 teams formerly employed in the same work. The results have been so satisfactory that the firm has decided to install vehicles of this type in place of all its horses as fast as this is found practicable.

The Public Service Gas Company of Newark, N. J., has placed a repeat order with the Adams Bros. Company, Findlay, O., for 10 one-ton Adams trucks, which were specially designed for its use. The purchase was the result of a two years' test in which accurate record was kept of the work done by each vehicle and the cost of operation.

The Gramm Motor Truck Company, Lima, O., recently shipped six Gramm trucks to a contracting firm in Manila, Philippine Islands. This make of vehicles has enjoyed splendid success in that section, one concern now operating a fleet of 20 in transporting building materials and supplies over the character of roads to be found on the Island of Luzon.

MOTORING LAWS AND THEIR ENFORCEMENT.

Troublesome Clause in Michigan Statute Declared Unconstitutional---Movement for Uniform Legislation in New York--Two States Added to List in the West.

MOTORISTS in Michigan have won a signal victory in the decision of the supreme court in the case of Nina L. Dougherty vs. William S. Thomas, in which a clause of the automobile law of 1909 is found to be unconstitutional. Under this act the owner, not the driver, could be held responsible, and the suit in question was brought as the result of an accident which occurred when a garage employee was delivering a machine to its owner. The clause which has been declared unconstitutional, reads as follows:

The owner of a motor vehicle shall be liable for any injury occasioned by the negligent operation by any person of such motor vehicle, whether such negligence consists in violations of the provisions of the statute of this state or in the failure to observe such ordinary care in such operation as the rules of the common law require, but such owner shall not be liable in case such motor vehicle has been stolen.

Justice Stone in commenting upon this section of the law said:

To hold sub-division 3 of section 10 constitutional is to hold a party absolutely liable for the negligent conduct of another, a mere stranger or a willful trespasser, no matter how careful or how free from negligence he himself has been. We think that the result of such a holding would be to take the property of defendant, Thomas, to pay for the wrongful and negligent act of another person, not sustaining to him the relation of servant, agent or employee.

Such a doctrine seems unnatural and repugnant to the provisions of the constitution here invoked. We are forced to the conclusion that the provisions of this subdivision are not a necessary regulation in the exercise of the police power; that in and by its terms the plain provisions of the constitution are violated and the sub-division must be held unconstitutional, and the statutory liability therein asserted done away with.

SITUATION IN NEW YORK.

Tire Dating Bill Goes to Governor, but Others Expected to Remain in Committee.

Although a bill providing for the dating of all automobile tires offered for sale in New York State was killed in committee during the 1912 session of the legislature, it would appear that so much attention was paid to other automobile legislation before the body this year that those interested forgot to watch the tire dating proposition. It was not until the bill had passed both branches of the legislature and was before the governor for his signature, that the industry began to take action. Someone in the commonwealth seems to be anxious that no old tires shall be sold to the consumer, while most of the tire manufacturers claim that tires at least three years old are better than those freshly cured.

The storm of disapproval that met the score of other motoring bills is said to have given the committee the impression that it would be better to let them rest in committee. It may be well for organized motorists in New York not to take anything for granted in this connection, however. Senator Loren H. White has introduced a bill authorizing the governor to appoint a commission of three members to consult with similar commissions from Maine, Vermont, New Hampshire, Massachusetts, Rhode Island, Connecticut, New Jersey, Pennsylvania, Delaware and Maryland with a view to securing uniform automobile laws, licenses and registration fees. This is taken as a further indication that no further legislation will be attempted this session.

SEVEN WORDS LEFT OUT.

An Emergency Exists, but Does Bar Harbor Get the Automobile Tourist?

The history of Bar Harbor, Me., and its attempt to attract the motoring tourist seems far from being a closed book as yet. It will be remembered that some few years ago the Maine legislature passed an act excluding automobiles from the town of Eden, in which Bar Harbor is situated. It has been contended by the permanent residents of the island that the wealthy summer people were responsible for this action.

Last year a special act was passed permitting automobiles on certain streets. This year there was a determined effort to open the whole island to motoring tourists and the bill passed the legislature. In Maine, whenever it is deemed advisable for an act to take effect upon its passage it must carry an emergency clause, and such clause is permitted only in cases "affecting the public peace, health or safety."

Otherwise new laws go into effect 90 days after their approval. Those interested in securing the summer trade did not desire to wait three months. Accordingly the bill went to the governor, and was signed by him, bearing the emergency clause, but neglecting to contain the words,

Digitized by Google

"This act shall take effect when approved." The permanent residents of Bar Harbor declare the emergency clause is sufficient, but there has been some talk of securing an injunction if an attempt is made to drive a car onto the island before the 90 days have passed. The emergency clause reads as follows:

Whereas, the summer resort interests of the town of Eden are the principal business interests of that town, and the admission of automobiles thereto other than at the commencement of the summer season would seriously interfere with the conduct of business therein; and, whereas, the interest of the people of the state at large requires that travel by automobile to the village of Bar Harbor, in said town of Eden, be permitted at the commencement of the summer season, provided that such travel is to be permitted at all; and, unless this act is passed as an emergency act it cannot take effect until the middle of the season at Bar Harbor, an emergency therefore exists, and the public health, peace and safety will be conserved by the immediate admission of automobiles to said town.

SKIDDING IN MONTANA.

At Least One Rear Wheel Must Be Fitted with Tire Chain, Etc.

The legislature of Montana has passed the state's first automobile law. In the main the new statute follows closely those which have been in operation in other commonwealths, and non-residents are exempt from its provisions if they have complied with the laws of their own state. The registration fee is $2, and the license fee for a chauffeur the same. The usual provisions for brakes, signalling devices and lights are made, the last named being visible 200 feet, with a red light at the rear, all to be lighted from one hour after sunset to one hour before sunrise. The speed provision is "reasonable and proper." Perhaps the most interesting innovation is found in the following:

Every motor vehicle operated and driven upon the public roads or highways of this state when such public roads or highways are in a wet, slippery or slimy condition, or in such condition that motor vehicles operated and driven thereon slide, skid, slip or have a tendency to get beyond control, shall have fitted upon at least one of the rear tires of such motor vehicle at such time or times, a tire chain or such other contrivance as shall be adequate and sufficient to prevent said motor vehicle from skidding, slipping or sliding, and such as shall not cause any considerable damage to the public road or highway.

UNIVERSAL LIGHTING BILL.

Rhode Island's Proposed Law Follows Closely That Adopted by Massachusetts.

Although the house judiciary committee in Rhode Island has prepared a substitute universal lighting bill which follows closely that in force in Massachusetts, some objection has developed with respect to the clause exempting vehicles when operated where street lights are maintained at intervals of 500 feet. It is maintained that there is quite as much need for horse drawn vehicles to carry lights at such points as any other. The bill would amend chapter 87 of the general laws and reads as follows:

Sec. 16—Every vehicle, when located or operated on any public highway or bridge, shall display one or more lights on said vehicle so placed as to be visible both in the front and the rear during the period from one hour after sunset to one hour before sunrise: Provided, however, that this section shall not apply to any vehicle operated upon any street or highway where street lights are maintained at intervals of 500 feet, or to any vehicle which shall be transporting as its principal freight any commodity that would readily catch fire from the use of a lantern or other lighting device; and provided, further, that this section shall not affect the provisions of sec. 16 of chapter 86 of the general laws relative to motor vehicles.

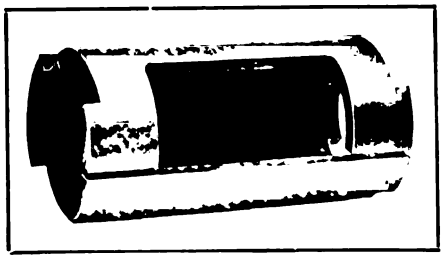
Sec. 17—Any person in charge of a vehicle on any public highway or bridge and not having a light on such vehicle as provided in the next preceding section who shall refuse when requested by a police officer or constable to give correctly his name and address, shall be guilty of a misdemeanor, and upon conviction thereof shall be fined not exceeding $5.

Sec. 18—Any person violating the provisions of sec. 16 of this chapter shall be fined not more than $20 for each offense.

NON-RESIDENTS IN NEW MEXICO.

Permitted to Operate Their Machines for Period of Sixty Days.

Unlike many of the commonwealths of the Far West the new State of New Mexico has passed a motoring law which provides a graduated system of registration fees. Non-residents are exempt from this provision for a period of 60 days. The fees are as follows: Under 12 horsepower, $2; 12-20, $4; 20-30, $6; 30-40, $8; 40-50, $10; over 50, $12. The law makes the usual provisions for lights, which must be lighted from one-half hour after sunset to one-half hour before sunrise.



Section 13 provides that whoever operates a motor vehicle while in an intoxicated condition shall be guilty of a misdemeanor. The matter of speed is not covered, except that it must be reduced to at least 15 miles an hour at cross roads, but it may be held to have been considered in the following:

Section 8—No owner of a motor vehicle who shall have obtained a number and registration, as provided in this act, shall be required to obtain any other certificate to use or operate such motor vehicle on any of the public highways of this state, and no motor vehicle shall bear any other number or license other than as provided for in this act. Provided incorporated cities, towns and villages may pass ordinances providing regulations for the operation of motor vehicles, and may require owners residents of such cities, towns and villages to register their state numbers in the office of the city, town or village clerk, but such registration fee shall not exceed 50 cents per annum.

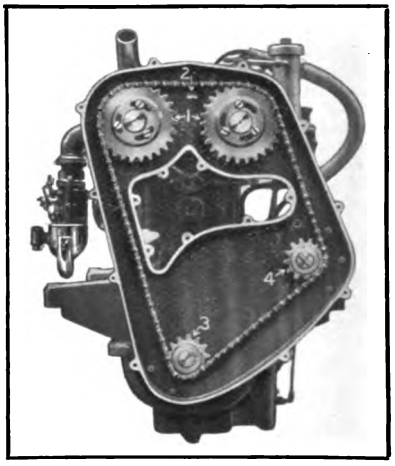
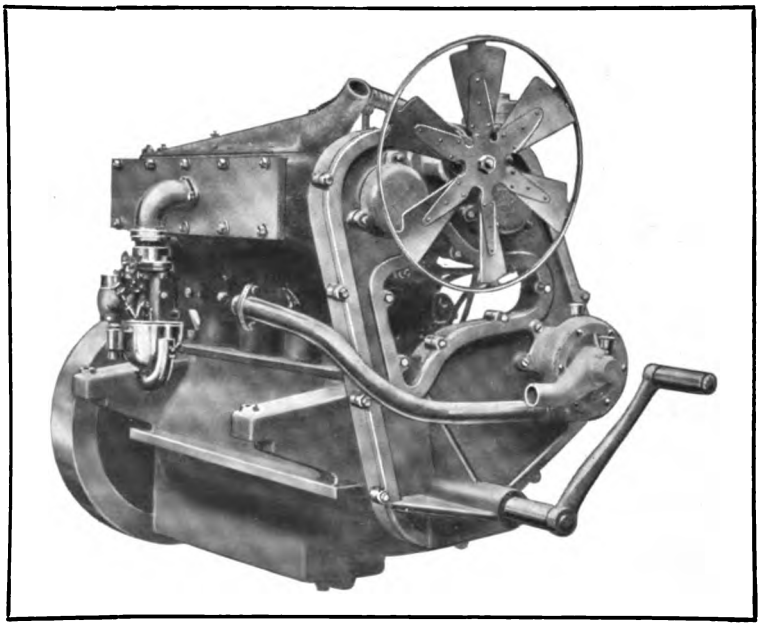
ELLIOTT ROTARY VALVE ENGINE.

ONE of the strictly new features revealed at the Boston show was the Elliott flexible rotary valve engine, exhibited by the Elliott Motor Engine Company, Waltham, Mass. This is a new concern, the officers being as follows: President, Gilbert R. Elliott; vice president and general manager, Henry N. Schwartz; secretary and treasurer, Frank P. Harris. The motor shown may be regarded somewhat in the nature of an experimental proposition, although the tests to which it has been subjected determined results which indicated that it was thoroughly practical in every way. The company will begin work at once upon the construction of a new engine which will present a decidedly more finished appearance.



Section of Elliott Valve Cylinder.



Chief interest centres in the valve, which is in the form of a hollow cylinder. This is constructed in sections, four being utilized for the inlet and four for the exhaust in a four-cylinder engine, and six of each for a six-cylinder motor. It will be noted, from an accompanying illustration, that the sections are recessed at either end, and while all sections are interchangeable, the only care necessary in assembling is to arrange each with proper regard for the timing of the motor.

It also will be noted that there is a slot extending the entire length of the section, this being left for the purpose of allowing for the expansion and contraction of the metal. The port is 1.25 inches wide and three inches long. This registers with a slot in the motor cylinder .375 by .375 inch. The same construction applies to both the inlet and exhaust.

The intake manifold leading from the carburetor brings the mixture to a constricted chamber from which the suction of the piston conveys it to the revolving cylinder, through one or more of these ports. It will be seen that the intake cylinder thus becomes in the nature of a reservoir, from which the gas is distributed to the motor cylinders in proper firing order. The same thing applies to the exhaust cylinder, in that each motor cylinder in turn exhausts into the reservoir thus created, from which the burned gases escape to the exhaust manifold through one or more ports as the cylinder revolves.

Driving Means on Elliott Motor.

Inlet Side of New Elliott Flexible Rotary Valve Engine.

The cycle of operations is the same as with any four-cycle engine. When the No. 1 motor cylinder is drawing in a charge, the port in the revolving valve is registering with the port in the motor cylinder, and one or more ports of the valve are registering with the intake manifold from the carburetor. The suction of the piston not only draws in

Digitized by Google

the charge, but causes the mixture to enter the revolving cylinder reservoir at the same time. And the same action takes place as each port registers with its respective port in the motor cylinders.

In the matter of valve lubrication the pump conveys oil to the front of the valve chamber, from which point it flows to a channel underneath the revolving cylinder, which is at all times maintained in a film of oil. It is held that sufficient lubricant is carried in with the mixture to lubricate the engine cylinder walls, etc. It also is pointed out that the slot in the valve section is at all times sealed by the cushion of oil on which the cylinder revolves.

Another illustration presents the driving means, and it will be noted that the chain drives both cylinder valves in the same direction. In the illustration the inlet is at the left and the exhaust at the right. This chain is driven from the crankshaft at 3 and drives the pump at 4 and the fan at 2. It is understood that in future designs the location of the pump will be changed slightly to make for more efficient running of the chain, but the present construction serves to indicate the principle of operation.

The third view presents the completely assembled motor, inlet side, as exhibited at the show. This is a four-cylinder engine with bore of four inches and the stroke of five, giving a rating under the S. A. E. formula of 25.3 horsepower. The piston displacement is 251.3 cubic inches. Under block test this engine is said to have developed 41 horsepower. Further information concerning the design is awaited with interest.

It is the claim of the Ford Motor Company, Detroit, that Ford machines are in use where the sun shines during 24 hours of each day, for shipments have been made to all parts of the world. One day's shipment recently comprised cars billed to the following places: Aden, Arabia; Bangkok, Siam; Batavia, Java; Buenos Aires, Argentina; Colon, Panama; La Guayro, Ciudad Bolivar and Maracaibo, Venezuela; Marango, San Paulo, Popotas and Scerabaya, Brazil; Montevideo, Uruguay; Tampico, Mex.; San Juan, Porto Rico; Santa Clara, Cuba; Tien Tsin, China; Valparaiso, Chili and Yokohama, Japan.

HENDERSON SOLVES PROBLEM.

Will Utilize New Tent on the Indiana Manufacturers' Transcontinental Tour.

One of the chief problems which has confronted those who are making arrangements to take part in the transcontinental tour of the Indiana Automobile Manufacturers' Association from Indianapolis to the Pacific Coast in July, is that of providing sleeping accommodations for the tourists during the 19 nights which they will spend away from the vicinity of hotels. The entries of the Henderson Motor Car Company will be equipped with a tent recently placed in the market and patented by A. W. Eberhardt of the Compac Tent Company, Indianapolis.

The particular feature of this equipment lies in the absence of poles. The tent is made to accommodate two, four and six persons, and is somewhat like a pyramid cut in half. It is made in one piece, the ventilation being accomplished by six windows covered with a gauze netting and protected from the rain by canvas flaps. The tent is opened from both ends by doors that are fastened together with button snaps, and a partition divides it into two private rooms with separate entrances.

Henderson Car and Compact Tent Which Will Take Part in Indiana Manufacturer's Tour to Pacific Coast.

George Schoeneck of Chicago has suggested a non-stop motor run from Chicago to Louisville, Ky., which is being considered by Chicago motorists. The plan, if adopted, will be confined to cars of six cylinders. It will demonstrate, according to Mr. Schoeneck, the absolute dependability and flexibility afforded by machines of that type.

CORRESPONDENCE WITH THE READER.

Rutenber Motor.

(1509)—Can a distributor be fitted to a Rutenber motor? Kindly forward me the address of the maker of the motor. W. G. R.

Elmwood, Mass., March 25.

As the model of the motor was not mentioned the writer cannot state whether or not a distributor could be fitted easily. If provision is not made for attaching a distributor the expense involved might be considerable. If the design includes a timer shaft, the distributor could be mounted on this member. The address of the maker is the Rutenber Motor Company, Marion, Ind. In writing give number or model of motor.

S. A. E. Horsepower Formula.

(1510)—What is meant by the letters S. A. E. H. P., which appear in your issue for March 10? I notice that a number of cars are fitted with a semi-floating type of rear axle? Are these any better than others? L. G. R.

Detroit, March 23.

The letters S. A. E. are an abbreviation for the Society of Automobile Engineers, which is

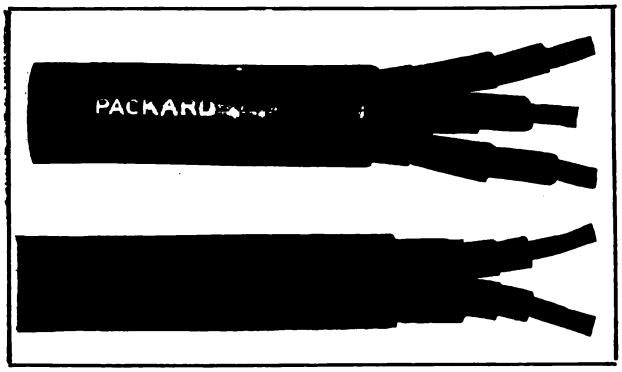

Fig. 1—Two and Three-Strand Cable Utilized for Electric Lighting.

composed of mechanical and electrical engineers connected with and interested in the automobile industry. H. P. represents horsepower and S. A. E. H. P. is the horsepower rating under the formula of the organization, which is as follows: Square of the bore times the number of cylinders, divided by 2.5.

This formula was adopted by the Association of Licensed Automobile Manufacturers, or the A. L. A. M. as it was more popularly known, in May, 1907, following the previous adoption of a similar formula by the Royal Automobile Club of Great Britain. Although the piston speed is not an element of the formula itself, it is based on a piston travel of 1000 feet a minute, it being assumed that the motor with a shorter stroke will make a greater number of revolutions a minute, and that the one with the longer stroke will make a fewer number, relatively.

The action of the A. L. A. M. was based upon the recommendation of its mechanical branch, composed of engineers associated with members of that organization. When this association was succeeded by the Automobile Board of Trade, soon after the so-called Selden patent case was decided adversely by the courts some two years ago, the data in the files of its mechanical branch were turned over to the Society of Automobile Engineers, and the horsepower formula became known as the S. A. E. instead of the A. L. A. M. Formal adoption of the formula was not made by the S. A. E., however, until very recently.

In the matter of rear axles there is a difference of opinion among engineers. Both the semi and full floating types are employed on high grade cars.

Timing Magneto.

(1511)—Will you please give information on timing a magneto? The motor is a four-cylinder unit and fires 1, 3, 4, 2. H. T. SCHAETZLE.

New Vienna, Ia., April 1.

The installation of a magneto and timing of same with the motor firing 1, 3, 4, 2, was described and illustrated in the issue for Feb. 25. The subject of proper lead with diagram was discussed in the issue for Dec. 25.

Lighting Cable.

(1512)—In your issue for March 10, in the lighting story, mention was made of a two-strand cable and of its advantages. What is a two-strand wire and why is it better than any other form? How is the insulation put on? INTERESTED.

Mystic, Conn., April 5.

A two-strand cable comprises two wires, each of which is insulated and both enclosed by other insulation. The construction is shown at Fig. 1 and it will be seen that each wire is fully protected. The advantage of the twin-strand is that in installing there is but one wire to handle and the double insulation affords greater protection. Triple-strand wires also are manufactured, as will be noted by the illustration.

The insulation is applied by special machinery. The Packard Electric Company, Warren, O., maker of Packard cable, puts one braid on each individual conductor and these braids are of special color, etc. Each one is treated by passing four or five times, depending on the size, through a special process in which is applied a flexible film. The braids are then put together and twisted into a round section and the spaces filled with jute twine. A double braid is next placed over the outside and given a special treatment.

Digitized by Google

This seals the rubber insulation against the deteriorating influences of heat and grease. The final covering is a double braid of tough thread,

Fig. 2—Showing the Construction of a Four-Cycle, Four-Cylinder Crankshaft.

which acts as a protective tubing, over which may be placed bushings where the cable passes through a channel frame or over a sharp edge.

Four vs. Six-Cylinder Crankshafts.

(1513)—I have a four-cylinder motor which I thought could be converted into a six-cylinder. I can easily secure the two extra cylinders, but am told that I would need a new crankshaft and camshaft, and that the expense involved would be too much to warrant the change. What is the difference between the crankshaft of a four and a six and why is not the plan practical?

SUBSCRIBER.

Houston, Tex., March 23.

The plan suggested would not be advisable because of the work and expense involved. It would require a new crankshaft, camshaft, crankcase, gears, etc., to say nothing of a larger radiator.

The difference between a four and six-cylinder motor is considerable. With the former type two pistons, connecting rods and cranks are always moving up at the same time that the other two are moving down, the impulses to the crankshaft created by the explosions being so timed that each cylinder is at all times one stroke of the cycle behind its predecessor. By referring to Fig. 2, which depicts a four-cylinder crankshaft, it will be noted that the two end cranks are located at the ends of the shaft and the two middle ones at exactly the opposite side, or at an angle of 180 degrees with them.

It should be borne in mind that there are four separate operations in the cycle, and that each requires a stroke. They are: Intake or suction, compression, firing and exhaust. For instance, when the first cylinder is exploding, the second is compressing, the third is drawing in its charge and the fourth is exhausting. The firing order may be 1, 2, 4, 3, or 1, 3, 4, 2.

With a six-cylinder motor the cylinders fire at intervals of 120 degrees of crank angle, and 60 degrees before the end of the power stroke of any one cylinder the next cylinder commences its power stroke. There are thus six periods of 60 degrees each during each cycle or two revolutions of the crankshaft when two cylinders are developing power. During half the time the motor is running two cylinders are doing useful work, two are drawing gas and two are exhausting. This is termed overlapping of the strokes and accounts for the flexibility of the six-cylinder unit.

The position of the crankthrows of a six-cylinder crankshaft is shown at Fig. 3, the upper view making clear the degrees of angularity. The lower illustrates a crankshaft with the connecting rods. It will be seen that the firing order will be decidedly at variance with that of a four-cylinder unit and as the operation of opening and closing the valves is accomplished by cams their action must conform to the firing order of the motor. Not only would a number of mechanical changes be necessary, but the motor would require a six-cylinder magneto, timer or distributor, as four-cylinder units would not be applicable for the reasons above mentioned. It should be much more satisfactory and cheaper to purchase a complete power plant.

Piston Displacement and Horsepower.

(1514)—Kindly explain why it is that some cars have a greater piston displacement, although rated at the same horsepower. We have a Ford car and find that the piston displacement is smaller than other makes, therefore we are interested. How is it that the Oakland motor with 19.6 horsepower has so much power in pulling a heavy car? Does the piston displacement have anything to do with the power of a car? We enclose a list of cars taken from your valuable publication. F. D. B.

Fort Dodge, Ia., March 21.

There has been a growing tendency among manufacturers to increase the piston displacement of motors during the past three years. In many instances the increase is due to lengthening the stroke without enlarging the bore. It should

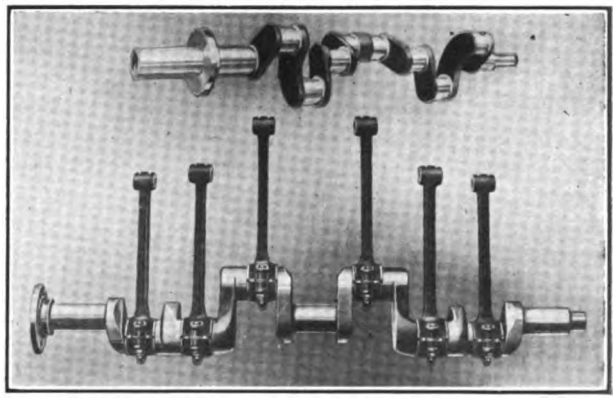

Fig. 3—Illustrating Crankshafts of Six-Cylinder Motors, the Lower View Outlining the Relative Positions of the Connecting Rods.

be remembered that the S. A. E. horsepower rating is based upon the bore, not the stroke, and that a four-cylinder motor having a four-inch

Digitized by Google

bore and stroke, for example, is rated at 25.6 horsepower. Similarly one having the same bore, but a stroke of five is classified as having 25.6 horsepower, although its piston displacement is greater. This is shown in the table submitted in which the Ford having a 3.75-inch bore and four-inch stroke is rated at 22.5 horsepower and as having a piston displacement of 176.7 cubic inches. The Nyberg has a similar bore, but the stroke is 5.25 inches and its piston displacement is 231.9. A study of the specifications published in the issue of The Automobile Journal for March 10 will reveal the varying horsepower of motors, although the bore is the same.

Regarding the statement that the Oakland with 19.6 horsepower has so much power in pulling a car it may be stated that two different makes of motors having the same bore and stroke may differ in the energy developed because of the design. There are a number of factors to be considered, such as the size of the valves, compression, scavenging, muffler, etc. The design of the other components of the car would also be a factor.

The horsepower of a motor is not determined by the piston displacement, although there are advocates of the plan. As previously stated there are a number of factors to be taken into consideration, although with all conditions equal it is only reasonable to assume that a motor having a greater piston displacement will develop more power because of the larger amount of fuel that can be impressed into a cylinder during the suction stroke.

Repairing Magneto.

(1515)—Will you kindly answer the following in your correspondence with the reader: I have a high-tension magneto made by Jacobson & Brandow, Pittsfield, Mass. Has that company sold out and if so to whom? Where could I have the fields recharged? A SUBSCRIBER.
Albany, N. Y., March 20.

The J & B Manufacturing Company, Pittsfield, Mass., which is understood to have succeeded Jacobson & Brandow, advises that the instrument referred to was not made by it. The company states, however, that it is in a position to make any repairs to the magneto mentioned.

Valve Timing.

(1516)—I have a 1912 four-cylinder Herreshoff car and wish to check up the valve timing as the adjustments of the valve lifters appear to differ and the space between the tappets and stems vary. As the flywheel is enclosed what method should I pursue? INFORMATION.
Binghamton, N. Y., April 3.

When it is not possible to check up the valve timing by the marks on the flywheel, the pistons will have to be utilized. Secure a piece of stout wire, a bicycle spoke for example, of a diameter sufficiently small to move easily through the opening of a petcock. Open all of the petcocks to relieve the compression, and it would be well to remove the spark plugs also.

The No. 1 cylinder, that nearest the radiator, will be the handiest for checking up the timing. Insert the wire rod through the petcock and crank the motor slowly until the wire descends. Continue to rotate the starting crank until the rod completes its downward movement and is about to ascend. Now mark the wire with a file, then again crank the motor until the rod attains its topmost position, and make another mark. These indentations will indicate the piston travel of the stroke. Check up the marks by repeating the operation to make sure they are correct.

Having determined the top and lower dead centres it is an easy matter to check up the timing. Next calibrate the rod with the file and a rule. The timing of the intake valve is as follows: Inlet opens .015625 inch late; that is, the piston descends that amount on the intake stroke before the valve lifts. The intake valve closes 3.40625 inches late, starting up on the compression stroke before closing. Measure off from the bottom of the rod, 3.40625 inches, which represents the point at which the piston should be when the intake valve closes.

Insert rod with piston at top dead centre and rotate crankshaft until the mark representing .015625 inch registers with the top of the petcock. This is the opening of the intake valve and the adjustment of the valve mechanism should be changed if the valve opens late or early. Now rotate the flywheel until the rod drops to the second mark, the closing of the intake, and correct any errors. Each intake valve should be checked in a similar manner, performing the work carefully.

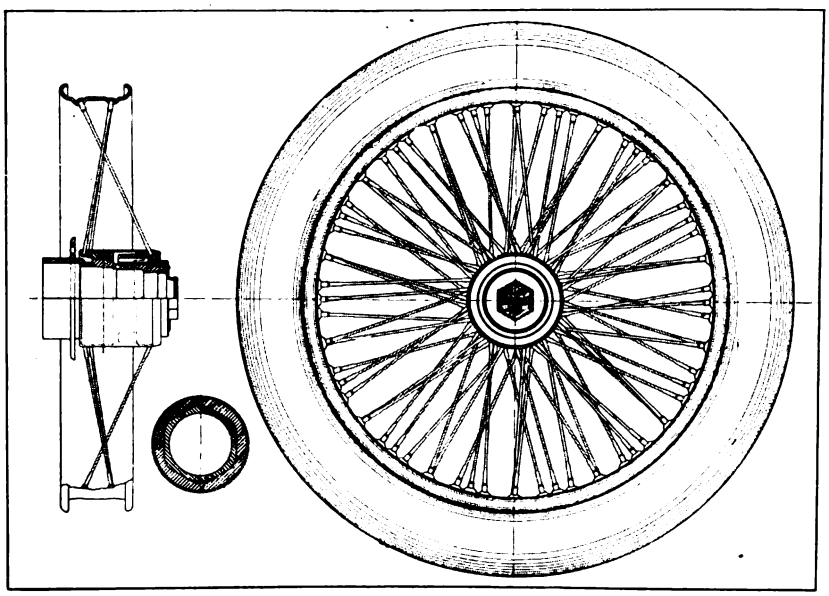
Having retimed the intake valves the exhaust members can be gone over. The exhaust valves close .03125 inch after the top dead centre and open 3.28125 inches from dead centre on the downward stroke. Each valve should be checked separately to obtain the best results. There is a special timing rod marketed for the work, but by exercising caution a wire may be utilized successfully.

The Nyberg four-cylinder racing machine, made by the Nyberg Automobile Works, Anderson, Ind., which Harry Endicott will pilot in all important dirt track events during 1913, was completed at the factory a few days ago and is now undergoing severe road tests.

Digitized by Google

FEATURES OF E-C DEMOUNTABLE WHEELS.

WHILE the American production of wire wheels of the modern type is of comparatively recent origin, it is significant that a number of new designs have been placed in the market. During the Chicago show, the E-C Sales Company of that city presented its E-C demountable wheels, one of these being of wire and the other of wood. It may be held that one of the possibilities arising from the present agitation of the wire wheel situation is that of a wider application of the demountable feature to wood members. As is more or less well known the Rambler has been fitting demountable wood wheels for the past two seasons, at least, and the list has been increased somewhat this year.



The construction of the E-C wire wheel is with two rows of spokes interlaced from the outer end of the hub to the inner edge of the rim and vice versa, presenting what is maintained by the maker to be a perfect truss with the use of only two rows of spokes. An accompanying sketch sets forth this detail in cross section as well as a side view of the wheel. An advantage claimed for this arrangement is that each row takes its correct share of the load.

The particular feature of the design is the use of an irregular taper drive, which is held by the inventor to be the only known method of eliminating both radial and lateral lost motion simultaneously. This form of drive is accomplished by the use of a hub, which is not circular in cross section, but is hexagonal with rounded corners. The wheel itself is made with an inner hub, which is supplied with internal locking means, and it is maintained that the direction of drive does not affect this locking mechanism, thereby making each wheel interchangeable with respect to the side of the car upon which it is fitted. It is further stated that there are no projections on the protected locking mechanism to be damaged if the hub is hit.

The wheel is attached and demounted through a special coarse thread of large diameter, which cannot be crossed, it is stated. Once the wheel is in place the whole assembly is held in position by a specially designed locking ring, for the tightening or loosening of which the demounting wrench or spanner is utilized, and it is maintained that the wheel cannot be left unlocked inadvertently.

The construction is such that the hub cap may be removed without demounting the wheel, and it is maintained that when the wheel is used with full floating types of axles the shafts also may be withdrawn without disturbing the assembly. The maker claims it is readily adaptable to any of the standard makes of axles without changing either the bearings or the tread of the car.

The E-C demountable wood wheel operates on the same principle as the wire member, and presents in addition to the other features that of less expense. It demounts at a convenient working height from the ground and at a machined joint, which is held to assure a true running wheel at all times.

Sketch Showing General View and Cross Section of E-C Wire Wheel.

W. J. Morgan, a pioneer contest promoter, has applied for a sanction to the contest board of the American Automobile Association for the promotion of the West Hudson and Catskill scenic tour, which, in addition to being a pleasure trip, will be an endurance, reliability, hill climb and fuel economy contest. The run will be of two days' duration and will be held May 14 and 15. The route will be announced later.

AVIATION IN AMERICA AND ABROAD.

EUROPEAN aviators appear to be devoting attention to the creation of new world's passenger carrying records. This is in line with the expressed demand in England and on the Continent for the development of the so-called touring aeroplane. It is suggested that by far too much attention has been paid to the matter of speed, although it is admitted that one point of unassailable superiority in the aeroplane is its ability to surpass all other means of transportation in this regard.

An accompanying table sets forth some of the new records established since the first of the year, in comparison with those which were in force at the end of 1912, wherever this is possible. While marks up to and including 250 kilometers were recorded in the class for speed according to distance—aviator and one passenger, previous to Jan. 1, those for 300, 350 and 400 kilometers are entirely new. Guillaux was unable to lower Legagneux's figures. There was no mark for altitude—pilot and six passengers, previous to that made by Faller, Jan. 4.

RECENT WORLD'S PASSENGER CARRYING AVIATION RECORDS.

Altitude—Pilot and Three Passengers.

*1912.

The Aero Club de France has definitely decided to hold the fifth race for the Gordon-Bennett international cup at Betheny, near Rheims, France, during an international meet scheduled for Sept. 26-28. Thus far challenges have been received from America, Great Britain and Belgium. Each country is entitled to three representatives.

The first race for this award was held at Rheims in August, 1909, and was won by Glenn H. Curtiss of America with a Curtiss biplane. The second was flown at Belmont Park, Long Island, in September, 1910, Claude Grahame-White of England being the winner with a Bleriot monoplane. The third was at Eastchurch, England, in July, 1911, when Charles Terres Weyman of America secured the prize with a Nieuport monoplane. The fourth was held at Chicago, in September, 1912, Jules Vedrines of France winning with a Deperdussin monoplane.

As a further evidence of the interest in the hydraeroplane, it is announced that Mortimer Singer has placed at the disposal of the Royal Aero Club of Great Britain a $2500 prize for an hydraeroplane competition among all-British machines. The prize will be awarded to the first machine carrying a pilot and passenger, which makes six out-and-home flights of five miles, starting from land, attaining an altitude of 1500 feet, alighting on the water, arising from the water and coming back to land.

In France the Aero Club de France is busily engaged in working out the details for two competitions for hydraeroplanes. One of these will be for a new Gordon-Bennett trophy, valued at 50,000 francs, while the other will be for a like sum in trophies and cash offered by the minister of marine. The latter comprises a distance test of 250 sea miles and a speed test over 100 sea miles. There also will be special tests for navigability, gliding, rising and alighting. The machines are to be divided into two classes, those for use on coastwise flights and those for use on the open sea.

Upon his recent return from abroad, after spending five weeks in Germany and France at the termination of the actions brought by the Wright Company against alleged infringements of the Wright patents, Orville Wright announced that he was at work on improvements in hydraeroplanes. "The present hydraeroplane is all right for smooth water," he is quoted as saying, "but there must be improvements for rough water and on these we are working."

Harry M. Jones of Providence, R. I., not only has the distinction of being the first aviator to alight on Boston Common, but he is the first to fly over New York City by moonlight. This lat-

Digitized by Google

est feat was accomplished about midnight, March 22-23, the machine being a Burgess-Wright biplane. Jones, it will be remembered, started from Boston in January on the first aerial delivery of parcel post. His midnight flight over New York City marked the completion of that trip, although the mail had been shipped to its destination by train some time previously.

Aviation engineers do not look with favor upon the plan of flying over cities, whether the flight be by daylight or moonlight. Several state legislatures have before them bills regulating the use of aeroplanes with special reference to this feature. For the most part these have the hearty support of the aviators themselves. The Massachusetts legislature has prepared a bill, in which Earl L. Ovington and Harry N. Atwood, two well known aviators, had a share. Among its provisions are the following:

No person shall operate an air machine of any kind unless licensed to do so by the state highway commission, except with a licensed air pilot, and then for a distance not exceeding 500 miles. All such licenses so granted shall expire on the last day of the year in which they are issued, and may be revoked at any time by the commission.

The license fee shall be $5, but no fee shall be charged for the issuance of a new license to a person whose license is about to expire. No license shall be granted until the applicant has passed a satisfactory examination by written replies to interrogatories by the commission, and of a flight to be made under the direction of an expert employed for the purpose by the commission.

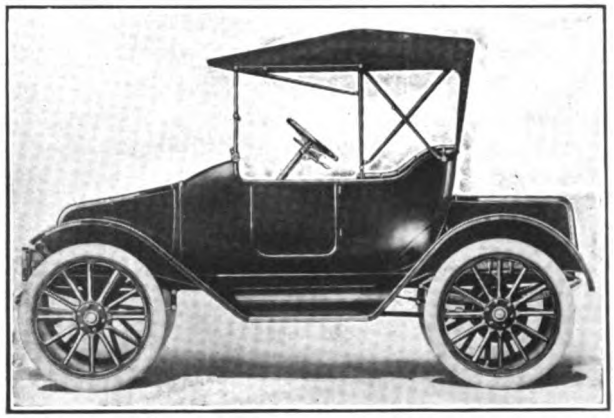
The questions put to the applicant shall include a test of his familiarity with such laws of the commonwealth as may be applicable to the operation of air machines. No person shall receive a license until he has proved to the satisfaction of the commission that he has flown not less than 100 miles in some standard type machine.

No air machine shall be used except for the purpose of experimentation, and then only upon or over the experimenter's own premises, until it has been inspected by the experts employed for the purpose by the commission and registered. The fee for registering a machine shall be $10. The registration number shall be painted on the underwing in letters readable at a height of 500 feet. No air machine shall be used for carrying passengers for hire until a special registration for that purpose has been obtained.

No machine shall be piloted over any ships or other craft at an altitude of less than 100 feet higher than the top of the highest mast, and an altitude of at least 200 feet shall be obtained before passing over any craft.

No air machine shall fly over a city at an altitude of less than 3000 feet, or over any town containing less than 1000 people except at an altitude of at least 500 feet, or over any town containing more than 5000 people except at an altitude of 1000 feet, or over an assemblage of people exceeding 100 in number at an altitude of less than 500 feet, or over isolated dwellings at less than an altitude of 200 feet, or over horses at less than 200 feet, or over driving horses or oxen at an altitude of less than 300 feet.

No missiles or other article shall be dropped from an air machine except with special permission of the commission. Air machines shall not land in highways or public parks. Violations shall be punished by fine of $25 to $500, or by imprisonment for not less than one month.



It shall be the duty of every city in the commonwealth to provide apparatus for determining the altitude and registration number of any air machine passing over the city.

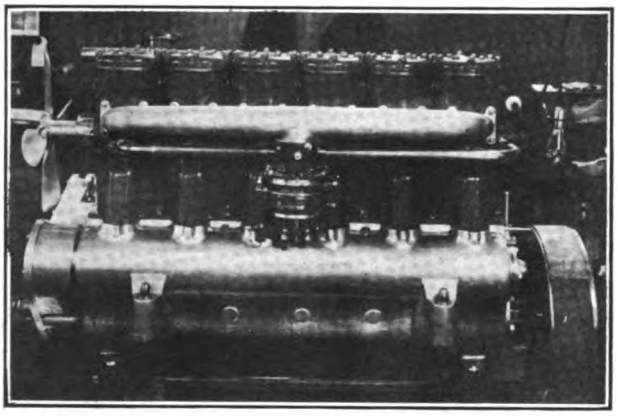
M. Perreyon of France claims a new world's altitude record of 19,868 feet, made with a Bleriot monoplane at Buc, France, March 11. The previous mark was held by Roland Garros also of France, who drove his Morane-Saulnier monoplane to an altitude of 18,378 feet at Tunis, Africa, Dec. 11, 1912. The new record, if accepted by the Federation Aeronautique Internationale, will return the honor to the Bleriot, which held the mark at 16,405 feet after Garros' flight in a machine of that make Sept. 6, 1912, and lost it to Legagneux in a Morane-Saulnier, who reached an altitude of 17,880, Sept. 17, 1912.

NEW ROADSTER MODEL.

Baker Motor Vehicle Company Announces Addition to the Baker Electric Line.

In an effort to supply what is regarded as an electric machine which will make its appeal to business men and others, the Baker Motor Vehicle Company, Cleveland, O., has added a Baker electric roadster, which is supplied with either wheel or lever steering mechanism at the option of the purchaser. An accompanying illustration presents the attractive lines, and it may be stated that the construction in every way conforms to the standard set by this company.

New Roadster Model Added to the Baker Electric Line.



The battery equipment consists of a 32-cell, 11 M. V. Hycap-Exide, made by the Electric Storage Battery Company, Philadelphia, and other fittings include a Tuto horn, made by the Dean Electric Company, Elyria, O.; complete set of lamps, side curtains, Weston volt-ammeter, shaft odometer, rain vision windshield, special electric pneumatic tires, best quality mohair collapsible top, etc. The wheelbase is 88 inches and the tread 50. The standard finish is blue with blue upholstery, but special painting may be had upon order, without charge, upon 30 days' advance notice.

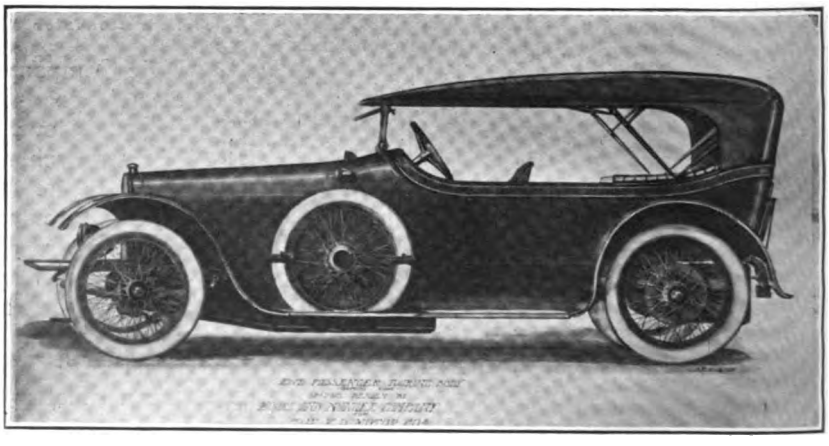
K-D SIX-CYLINDER CAR.

One of the Really New Features at the Recent Automobile Show in Boston.

Last year one of the features of the Boston automobile show was the new K-D motor, de-

Six-Cylinder Disc Valve Motor Utilized in K-D Car.



signed by Miss Margaret Knight of South Framingham, Mass. Briefly described, this was a four-cylinder, sleeve valve engine, in which two half-sleeves were made to perform the necessary functions for intake and exhaust. Subsequently, Miss Knight and Mrs. Davidson, who was associated with her in placing the motor in the market, organized the K-D Motor Company, which is understood to have acquired a plant near Boston.

This year the K-D motor was again one of the features of the display, but the engine was shown in six-cylinder form. In addition there was at this stand a chassis frame, surmounted by a completely equipped body, and announcement was made that the company was prepared to take orders for K-D cars to be delivered in September. Accompanying illustrations present the motor and the car as shown.

The motor does not differ materially from its predecessor, at least in principle. It is a six-cylinder unit, and some changes have been made in its general design and appearance, but the method of operation is essentially the same. And while the motor was of interest in itself, the design of the car was sufficient to hold the attention of those who visited the booth.

It is the work of Moore & Munger, Brookline, Mass., and has a decidedly distinctive appearance. In some respects it follows foreign lines to a certain extent. Examination of the illustration will indicate that the only entrance to the car is through the door leading to the tonneau proper. The individual front seats are separated by a liberal passage, and both are set at a decidedly comfortable angle. The cowl dash fully protects the occupants in every way. The rear compartment is fitted with every convenience for easy riding and the inlaid cases on either side serve to give an additional touch of refinement.

The exterior presents low, sweeping lines, merging at the dash and hood, which slope into each other in a pleasing manner. A hooded ventilator immediately in front of the dash, and the side lights, which are partially concealed, blend well with the remainder of the design. The extra Rudge-Whitworth wire wheel is carried in suitable brackets at the side, indentations in the running board being provided for two of these members if desired.

K-D Touring Model Revealed at Boston Show—Body by Moore & Munger and Chassis by Miss Margaret Knight.

According to statistics compiled by the office of public roads at Washington, D. C., the State of Rhode Island leads all others in the percentage of roads that have been improved. Not less than 49.1 per cent. were improved. Massachusetts is second with 49 per cent. and Indiana follows with 36.7 per cent. Next in order come Ohio, Connecticut, New Jersey, Kentucky, Vermont and California, the latter having 17.87 per cent. The states of Wisconsin, New York, Maryland, Utah, Tennessee, South Carolina, Maine and Michigan range from 16 to 10 per cent. North Dakota, which has only .23 per cent., is at the foot of the list.

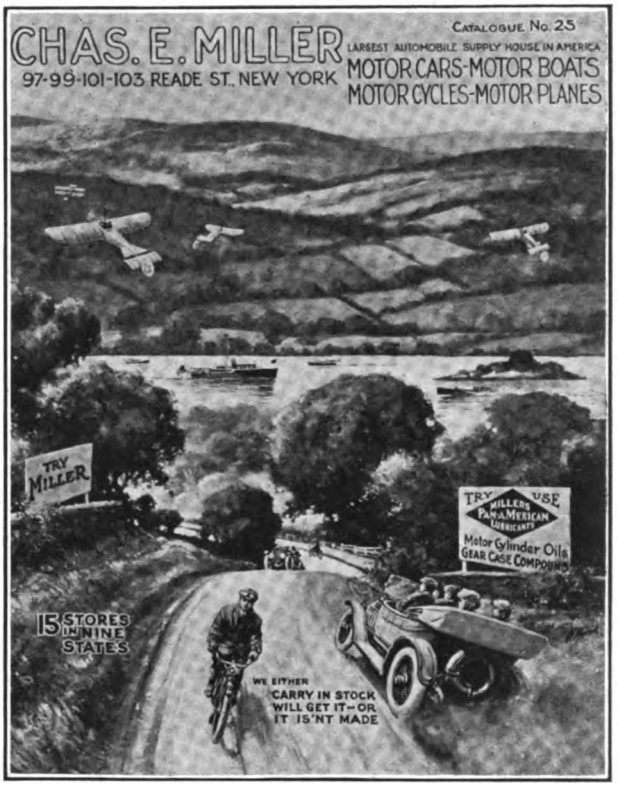
WANTS TRAFFIC CENSUS.

Good Roads Board of American Automobile Association Advocates Definite Plan.

That the failure of many roads to stand up under the traffic is due, not as many persons suppose, to inferior materials and workmanship, but to the lack of preliminary information as to the traffic the road was expected to stand, is the argument presented by the national good roads board of American Automobile Association. As a result, it is maintained that roads have been built which would have lasted for years under other conditions, but are now in ruins, due to the absence of data which the engineering profession in any other branch of work would consider essential.

This board advocates the taking of a road traffic census, following somewhat the lines laid down by the state highway commission in Massachusetts. It is contended that at first, in view of the changes in traffic and traffic conditions, which are being made rapidly and constantly, census should be taken at least four times a year, last at least a week at each period and cover the principal roads entering every city in the state. After a few years it is held that the establishment of practical standards, from which estimates could be made, would obviate the necessity for frequent countings. The board believes that the saving which would be effected in road construction would be such as to make the expense of the census seem trivial.

In this connection it is of interest to note a quotation from the Engineering Record of March 15 on this subject, as follows:



Without knowing the wear a road has there is absolutely no way of telling whether it is good or bad; only a careful traffic census can determine this. Roads too costly have been constructed in some places; in other places roads unsuited to the traffic have been built. In view of this well known fact it is evident that a traffic census is an essential to economy in nearly all road building. Imagine a bridge designer making plans for a structure without anything more than a rough guess whether it was to be used by steam railways or trolley cars, and we have an idea of the absurdity of proceeding with road building without traffic data.

MILLER'S ANNUAL CATALOGUE.

Attractive Cover Design Adequately Forecasts Nature of Its Contents.

The 25th annual catalogue issued by Chas. E. Miller, 97-103 Reade street, New York City, still further accentuates the pioneer position occupied by this house in the automobile accessory field. This edition will be ready for distribution about April 10. A reproduction of the front cover is presented herewith, and it will be conceded that it is one of the most artistic yet developed by that concern. The appearance thereon of the automobile, motorcycle, motor boat and aeroplane, indicates in a striking manner the nature of the accessories carried in stock.

The year 1913 marks a new departure, in that the policy of the house has been extended to include delivery of goods to any part of the United States by freight, express or parcel post. Although 15 branch stores are maintained in New York City, Brooklyn, Buffalo and Albany, N. Y.; Boston and Springfield, Mass.; Hartford, Conn.;

Presenting the Cover Design on Chas. E. Miller's Annual Catalogue.

Detroit, Mich.; Cleveland, O.; Philadelphia, Penn.; Atlanta, Ga.; New Orleans, La., and Newark, N. J., in addition to the main headquarters, this plan virtually places the immense Miller service in direct reach of all. The catalogue is complete in every respect, Miller's position as manufacturer, jobber, importer and exporter, being somewhat novel in the industry.

Joseph H. Weeks, chairman of the good roads committee of the Pennsylvania Motor Federation, recently appeared at Pittsburg and urged the motorists to unite in asking the legislature to pass the bond issue of $50,000,000 for good roads.

THE REPAIR SHOP AND THE GARAGE.

Features of New Daimler Carburetor Having Seven Jets and Six Distinct Air Passages---Adjusting Lighting Dynamos and Locating Grounds.

ANNOUNCEMENT is made of a new Daimler carburetor, an English design, which presents interesting features in that there are seven jets supplied with gasoline at a constant level from the conventional type of float chamber. A part sectional sketch of the vaporizer is shown at Fig. 1 and it will be noted that six of the jets are arranged in a circle with the seventh in the centre. The last named jet is utilized for starting and when the motor is operating at a slow rate of speed. Its opening is adjustable by a taper needle valve much in the same manner as with American carburetors, although with the Daimler provision is made for locking the adjustment by means of a nut. This prevents jarring loose of the low speed adjustment or tampering with it.

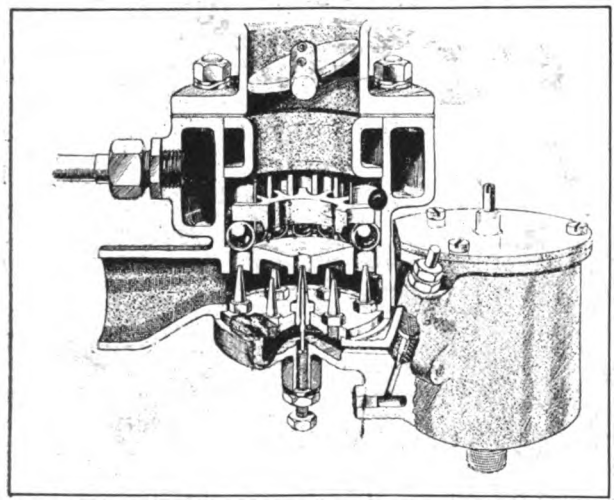

Fig. 1—Sectional Sketch of Daimler Seven-Jet Carburetor, Making for a Flexible Motor.

The main supply of gasoline from the float chamber to the fuel space below the multiple jets is also variable as to the quantity which can pass by another needle valve, adjustable in a similar manner as the starting needle member. The carburetor illustrated is designed for six-cylinder motors, and the needle is held off its seat normally by a spring, but is depressed by a contact lever, not shown in the drawing, which can be connected to the throttle lever or operated from the dash or other point convenient to the driver.

The arrangement of the six concentric jets is shown at Fig. 2 A and the utilization of the steel balls is similar to that employed by a well known make of American carburetor. The tip of each of the six jets in the Daimler is in its own choke tube, which is normally closed by a steel ball, this being lifted from its seat by the suction of the piston. There are also six air passages arranged alternately with the chokes, and each of these has a ball to close it normally. A bottom view of the choke tubes and air passages with their balls, and showing their arrangement in relation to the position of the central jet choke, is presented at Fig. 2 B.

Resting on all except one of the 12 steel balls is a spider weight with 11 arms, the 12th being represented by a gap past which one of the balls may be lifted by the initial increase of suction as the throttle is opened. In other words, when the motor is operating on the central jet and the throttle is opened one each of the balls covering a jet and choke tube has a lead over the others in responding to the increased suction. The remaining balls are lifted subsequently, but before they can rise the weight of the spider must be overcome to a greater or less extent. Each ball has a groove of its own, so that when it is lifted it must rise vertically, and when it falls it drops directly back on its seating.

The mixture from each of the jets and air passages combines immediately it leaves the various choke tubes, and passes up to the butterfly valve throttle placed across the induction pipe just above a hollow distance piece, which prevents the balls rising above the top of their respective grooves.

The carburetor is hot water jacketed at a point above the normal position of the balls, as shown in the drawings. The float chamber and fuel chamber carrying the jets may be removed easily when desired by disconnecting the feed pipe and slacking two wing nuts on hinged bolts. The advantage claimed for the carburetor is its quick response to varying positions of the throttle.

DYNAMO CLUTCH ADJUSTMENT.

It is only natural to assume that the owner of a car fitted with electric lighting and motor starting systems will turn to the garage repairman when trouble is experienced with the equipment. But it is possible that the owner may tamper

Digitized by Google

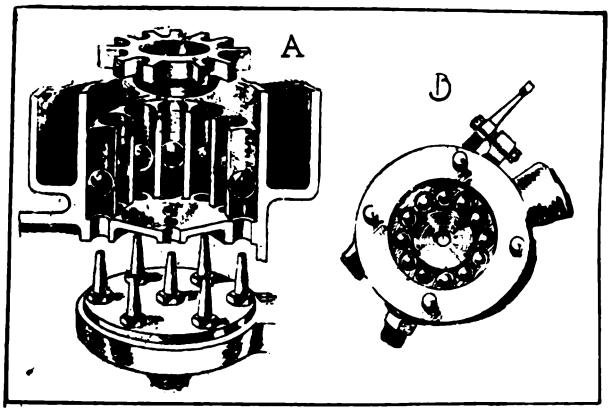

Fig. 2—Daimler Carburetor: A, Showing the Steel Balls Raised Above Their Seatings and the Spider Weight; B, Bottom View of Choke Tubes and Air Passages Covered by the Steel Balls.

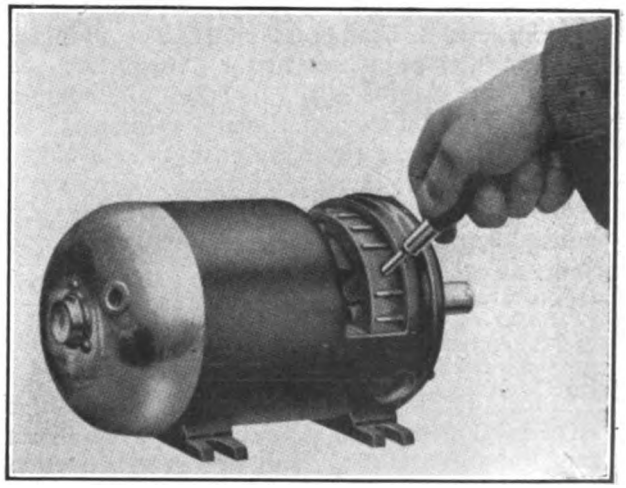
with the adjustments in an endeavor to secure maximum efficiency from the lamps when these members are at fault or have been replaced and not focussed properly.

Some lighting systems provide for regulating the output of the dynamo, among which is the Gray & Davis, fitted to a large number of 1913 models. Although it should not give trouble, it is possible through tampering by the owner that the output of the generator may be altered.

Before arriving at the conclusion that the dynamo is at fault the wiring should be examined thoroughly. Grounds occur when any two wires of opposite polarity come in contact with any conductive material and are indicated by the lights appearing to go out, although really glowing very faintly. One of this type will very soon discharge the battery.

The best method for testing is by utilizing a voltmeter. Disconnect and remove the battery from the car. Connect one side of the battery to the frame and the other to one wire of the voltmeter. Next touch with the free wire of the voltmeter each terminal of the junction box. If any deflection is noted, it indicates a ground. Disconnect each wire from the junction box, repeating the aboye test as each is displaced.



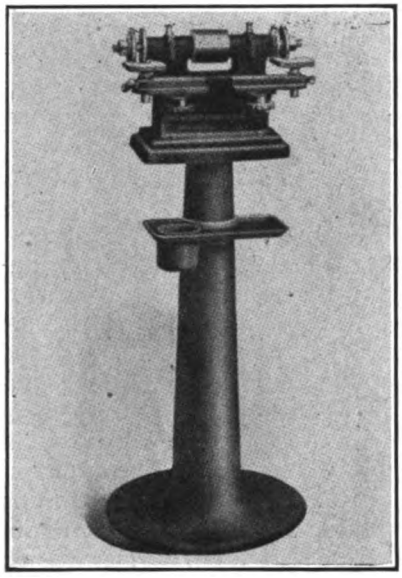
It is best to disconnect wires marked "to lower terminal of ammeter" and "to series dynamo." If the junction box then shows a ground, the trouble is in the lamp wires, and can be located by tracing the defective wire its entire length. If the ground is indicated when touching the wires leading from the junction box to the ammeter and dynamo, disconnect them at the ammeter and dynamo and repeat the voltage test. In this way, proceeding from terminal to terminal, the defective connection or worn place in the wire can be located without difficulty.

A slight ground may be due to the ground connection having such high resistance that only a small amount of current is lost. This is indicated by the battery not holding its charge and in some instances being entirely discharged over night. This trouble is first noticed when the lights seem to be dim at low car speeds, but brighten as the dynamo cuts in.

If, upon the conclusion of all tests it is shown that the dynamo is not giving its designed output, the clutch may be adjusted. This is accomplished by removing the outside cover and revolving the governor inside the shell until the opening in the shoe marked with a notch coincides with the drill hole in the shell. To increase the driving force of the clutch; that is, to augment the output of the dynamo, the screw is turned to the right. A screw driver .1875 inch wide is best adapted for the work. The method of adjusting the clutch is shown in an accompanying illustration. The governor action is very sensitive, and a full turn of the screw driver will make a considerable difference in the output of the dynamo. If not familiar with the operation of the dynamo, it is best to study the maker's instruction book, which should accompany each equipment.

SOFTENING CAST IRON.

To soften cast iron for drilling, heat the part to a cherry red, and have it lie level in the fire. Then with the tongs put on a piece of brimstone, a little smaller in size than the hole to be drilled. This softens the iron entirely through. Let the piece remain in the fire until cooled. It will then be ready to work and soft enough to drill.



Showing Method of Adjusting Clutch of the Gray & Davis Lighting Dynamo.

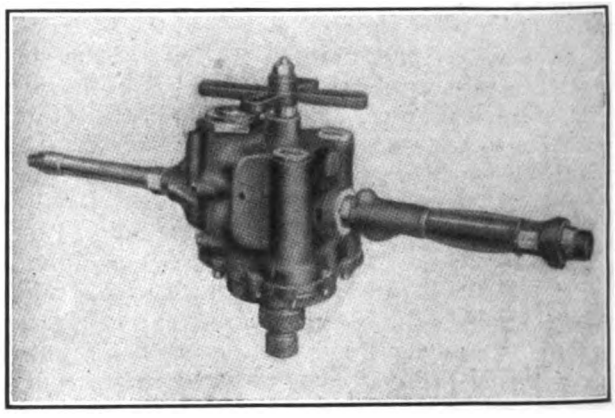
GARAGE AND REPAIR SHOP EQUIPMENT.

ABRASIVE wheels, even for rough grinding, should be substantially mounted to render them safe, as well as to perform satisfactory work. Emery wheels are essential to the equipment of a well appointed repair shop and they should run true if good results are to be obtained. The Webster & Perks Tool Company, Springfield, O., specializes in grinding and polishing machinery and in an accompanying illustration is presented a No. ¾ floor grinder, which is one of its many products.

Webster & Perks Grinder.

The steel spindle is 16.75 inches long and the diameter of the spindle between bearings is .875 inch, that between the flanges, .75 inch. The bearings are four inches long and the distance between the wheel is 12 inches. The diameter of the flanges is 3.5 inches. The pulley has a diameter and face of three inches and will swing wheels 10 inches in diameter by one-inch face and smaller. The height from the floor to the centre of the spindle is 41 inches and the top plate, where the head bolts on, is 9.5 by 13 inches. The diameter of column at the floor is 17 inches and the net weight is 175 pounds. The countershaft driving pulley is 12 inches in diameter by 2.25-inch face and tight or loose pulleys have a five-inch and 2.25-inch face. The net weight is 50 pounds. Complete details of its grinding machinery will be forwarded upon request by the company.



LITTLE DAVID PNEUMATIC DRILL.

Little David pneumatic drills are manufactured by the Ingersoll-Rand Company, 11 Broadway, New York City, and are designed to be operated by compressed air. That shown in an accompanying illustration is the No. 2, adapted for medium drilling, reaming, tapping, etc., and is fitted with a No. 3 Morse taper socket and .6875-inch square tap socket. Simplicity and interchangeability of parts are features emphasized in the tool, also convenience in handling and control.

The motor or engine is of the angular, four-cylinder, single-acting, reciprocating type, each pair of pistons being attached to opposite throws of a double crankshaft, each acting in balance, insuring smooth running. The drill is built reversible, but may be made non-reversible by simply inserting a small pin in a hole provided in the throttle handle. The valve action is such that there is no compression of exhaust, no matter which way the drill is operating.

The valves are geared to the crankshaft through the medium of a spindle gear and live air is admitted to the pistons alternately through two valves, one set of pistons being under compression while the other two are exhausting. The air enters a port in the throttle handle and travels to two ports. As the crankshaft revolves it in turn rotates the main gear to which the valves are geared and connects ports permitting the air to pass into a cylinder. Both cylinders take air for 120 degrees of the stroke. The piston also uncovers an exhaust slot in the side of the cylinder, allowing the drill to exhaust directly to the atmosphere.

High grade material and workmanship are incorporated and the crankshaft rotates in F. & S. ball bearings of liberal size. The spindle is provided with a thrust bearing interposed between

Little David Pneumatic Drill Which Is Held to Possess Many Advantages.

the shell and feed spindle. It is machined to receive standard Morse taper shanks and is threaded on the end so that chucks or other special at-

Digitized by Google

tachments can be utilized. An ejector pin is provided with the feed screw attachment for ejecting twist drills, reamers, etc., from the spindle by screwing the feed screw down to the lowest point. The feed nut centre serves as a supplementary feed, giving a considerably longer feed than with ordinary drills.

Two handles are provided, one containing the throttle valve and air hose connection, the other being a plain or dead handle. The latter is arranged for supplying lubricant to the drill. The maker points out that the ribbed design of the throttle sleeve is better suited for its particular function than knurled sleeves, as slipping of the operator's hand is prevented by eliminating grease, dirt, etc. The shell is so designed that the entire motor apparatus is assembled or disassembled through the crankcase by the removal of the cover. The company will forward a booklet on its drills upon application.

Following the practise of previous years, accessory makers are to offer special prizes for drivers of cars utilizing their product in the 500-mile international sweepstake race on the Indianapolis motor speedway, Memorial Day. The Bosch Magneto Company, New York City, will make three awards, conditional upon the use of Bosch ignition, these being as follows: To the winning driver, $500; driver of the second car, $300; third car, $200.

To encourage visits by the engineering classes of the large universities, the sales department of the Lozier Motor Company, Detroit, has issued invitations to the more important colleges throughout the country for a visit of inspection to the Lozier factory at Detroit. Acceptances already have been received from several universities in the vicinity of Detroit.

FORMULAE AND USEFUL MECHANICAL TABLES.

Decimal Equivalents of Millimeters.

The accompanying table of decimal equivalents of millimeters and fractions thereof will be of service when the metric measurement is utilized.

Leather and Iron Cement.

To face a cast iron pulley with leather apply acetic acid to the face of the pulley with a brush, which will roughen it by rusting. When dry apply a cement made of one pound of fish glue and half a pound of common glue, melted in a mixture of alcohol and water. The leather should be placed on the pulley and dried under pressure.

Removing Rust from Nickel.

Rust may be removed from nickel by smearing the parts with grease and allowing it to remain several days. If the rust be not deep it will come away with the grease when the latter is removed by a cloth dipped in ammonia. If the rust be very deep, apply a diluted solution of hydrochloric acid, taking care that it does not touch the metal. Wash and polish in the usual manner.

Testing Steel and Iron.

Nitric acid will produce a black spot on steel, the darker the spot the harder the steel. Iron, on the contrary, remains bright if touched with nitric acid. Good steel in its soft state has a curved fracture and a uniform gray lustre; in its hard state it is a dull, silvery uniform white. Cracks, threads or sparkling particles denote poor quality. Good steel will not bear a white heat without falling to pieces, and will crumble under the hammer at a bright, red heat, while at a mild red heat, it may be drawn out under the hammer to a fine point.

Aluminum Solder.

An aluminum solder may be prepared from 50.03 parts zinc, 47.99 parts tin, 1.76 parts aluminum and .22 parts phosphorus. The phosphorus should be added to the other materials in the following manner: Take a piece of one-inch gas piping, about 12 inches long, and screw a cap on at one end. A tin plug may be utilized to close the other opening. The phosphorus should be dried between blotting paper and exposed to the air as little as possible. Remove the cap from the tubing, drop in the phosphorus and replace the cap. The tinned end of the pipe is next dropped into molten tin, the heat of which will be sufficient to melt the plug, and the phosphorus will be mixed with the molten metal without danger. The zinc and aluminum can then be added until the whole forms an alloy. The prosphorus acts as a flux, and consequently, no sal ammoniac or spirits will be required when making a joint. An ordinary copper bit should be utilized.

CATARACT TIRE POLICY.

Careful Study of Production Problem Results in Improved Manufacturing Methods.

In view of the rapid development of the automobile industry, it is not surprising that it has taken much time and experimentation to produce equipment that may be regarded as perfected in every respect. This applies particularly to the matter of tires, which have been considered by many motorists as presenting the chief source of expense in the operation of a car. Tire manufacturers have realized this and have devoted a large amount of effort in solving some of the peculiar problems arising in this field. William J. B. Hackett, sales manager of the Cataract Rubber Company, with main office at Boston, factory at Wooster, O., and branches in a number of the larger cities, calls attention to some of the improvements in manufacture adopted by his concern, which should prove of decided interest to the owner. Mr. Hackett calls special attention to the composition of the product as well as the methods used in curing, etc. He writes as follows:

William J. B. Hackett, Sales Manager, Cataract Rubber Company.

The Cataract Rubber Company is using the highest grade of longest staple Sea Island cotton fabric produced in this country, and under several tests on a fabric testing machine it shows a minimum breaking strength of 430 pounds. Coupled with this fact, the weave is such that the rubber friction adheres to the minute perforations with a grip obtainable in no other way. We use more rubber between our fabric, resulting in more resiliency and prolonging the life of the tire where the strain is the greatest.

The system of mold equipment used by our concern produces a real live steam cured tire, as the mold ring extends about one-third of the way above the bead, exposing the entire tread surface to the steam. This also eliminates all possibility of fabric troubles, such as mold pinching, separation of the plies and buckling of fabrics.

In building up the tire it is carefully calipered at each stage of the construction. Therefore, when our final wrapping of the tread is completed we have a casing ready for insertion in the vulcanizer that is symmetrically perfect. As the mold rings in this system weigh about 40 pounds complete, all possibility of injury from weight during the curing process is avoided.

The Cataract Rubber Company guarantees its casings for 4000 miles and issues a signed certificate with each. We are pleased to state, however, that we have hundreds of users averaging better than 5000 miles on such cars as the Pierce-Arrow, Lozier, Simplex and Alco.

Our company is producing two types of inner tubes. One is a heavy, substantial red tube with a larger percentage of pure gum than usual. This is what we call the "come back." That is, it assumes its natural size after it has been inflated a month or two. We recommend this tube for high powered cars doing severe duty. The Cataract gray tube comprises what is known as a floating stock gum tube, having 90 per cent. of pure gum and making for resiliency and long life. It is our experience that this type outwears three casings.

Beginning with 50 tires a day the company will reach an output of 100 shortly, and it will not surprise the writer to see this increased to 500 a day within a year. In connection with our pneumatic production, we have, in the Cataract diagonal block truck tire, the solution most needed from the standpoint of economy and service in commercial vehicles. These are guaranteed for 10,000 miles and have shown over 12,000 miles on a three-ton Packard rear wheel. The truck is owned by the Adams Express Company and operated in New York City.

WOULD ORGANIZE BUYERS.

H. E. Gilman Has Plans for a National Association of Purchasing Agents.

The following communication is submitted by H. E. Gilman, now with the Marathon Motor Works, Nashville, Tenn., maker of Marathon cars. He believes there is opportunity for the organization of the buyers in the industry and his letter is self-explanatory.

About three years ago—when residing in the East—I conceived the idea of the formation of "The Buyer's Club of America" and carried this project almost to the point of incorporation, but when I left and went to the Middle West to reside, temporarily, gave up the idea.

At the time I endeavored to promote this scheme I wrote several hundred letters to leading buyers of the country, and practically every reply received showed that the scheme was met with great enthusiasm; in fact, a great number of buyers congratulated me on taking the initiative to bring together those affiliated with the buying interests of this country. It is manifest that the benefits to be derived are manifold.

It would be my idea to have the headquarters of this club either in New York or Chicago; using the top floor of some hotel centrally located, fitting it up in the most modern way and having everything connected with it up-to-the-minute. The object of this club would be—tersely speaking—to bring closer together those connected with the purchasing end of our organizations. There would undoubtedly be a mutual helpfulness resulting.

There is no such organization in existence today, and if the traffic men, engineers and men of other vocations of life can maintain a club, why cannot we purchasing agents do the same thing? Anybody connected with the metal industry would be eligible to membership. This organization, when once perfected, will not only be national, but will be international in its scope.

At the time I originally thought of this idea the Iron Age gave me an editorial, and numerous letters, both foreign and domestic, were written me on the subject, showing that great interest was manifested. What I want you to do is to give me a small space in your editorial columns and request any purchasing agent who might read the article to communicate with me direct, in care of the Marathon Motor Works, Nashville, Tenn., and I would be most pleased to receive your comments and criticisms pro and con on this subject.

I have the by-laws drawn up and the certificate of incorporation ready to be executed.

IN THE REALM OF THE MOTORCYCLIST.

Arrangements Practically Completed for Fourth of July Classic Road Races Over Elgin Circuit---Items of Interest to Rider, Manufacturer and Dealer.

CONSIDERABLE interest attaches to the arrangements for the long distance classic motorcycle road races over the Elgin speedway course, Elgin, Ill., July 4. Entry blanks are now being distributed by R. R. Hill of the Chicago Motorcycle Club, 3518 Ellis avenue, Chicago, and the lists will close May 15, although post entries will be received at a fee of $25 a machine until June 15. The regular entry fee is $10 a machine. It is understood that opportunity may be had to secure a position even after June 15 upon payment of $100 a machine. The conditions are:

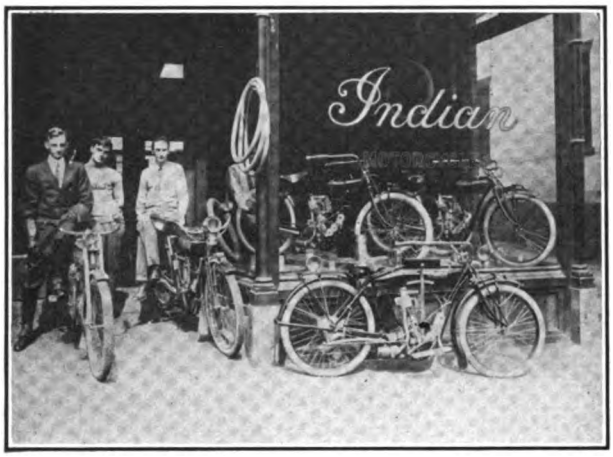
The contest will be divided into two classes, one for professionals and the other for amateurs. The distance for the professional class will be 250 miles, and for the amateurs 175. Both events will be run at the same time. The engine limit in each case will be the same, 61 cubic inches piston displacement. Only 1912 or 1913 models of any make will be eligible for competition. Factory entries will be limited to teams of four, and the right is reserved to reject any entry.

The prizes will be: Professional class—First, $500 cash; second, $250; third, $100. Amateur class—First, merchandise to the value of $250; second, value $125; third, value $75.

Motordrome Racing Circuit.

Motorcycle racing in Detroit will start May 14 or 21, depending upon the completion of the new quarter-mile motordrome now in course of construction on Jefferson avenue, opposite the factory of the Hudson Motor Car Company. The concern back of the venture has become incorporated with a capital of $20,000 and is known as the Detroit Motordrome & Amusement Company. Those interested are: E. H. White, A. J. Bath, E. R. Martin and John A. Wilson.

Racing will be carried on during the entire season from May until late in the fall, Wednesday, Saturday and Sunday evenings of each week, with occasional Saturday afternoon meets. These will form a part of the circuit championship races of the American League of motorcycle tracks or motordromes, of which that city is a member. A well organized team to represent Detroit will be formed to be composed largely of Detroit riders, probably including John Clarke, who made a sensation last year by his fast riding. Of the five tracks composing the circuit, the St. Louis, Cleveland and Chicago motordromes are all ready for racing. Work has started on the Cincinnati track, which will be located at Lagoon park, Ludlow, Ky., on the opposite side of the Ohio river, and it soon will be in condition.



Group of Flying Merkel and Thor Riders in Front of the Merkel-Thor Agency Conducted by Finch & Hayes in Hartford, Conn.

New Clubs Recently Affiliated.

Following are the new F. A. M. affiliated motorcycle clubs, as reported by Secretary G. B. Gibson, Westboro, Mass.: Freeport, Ill., 19 members, secretary, Joseph Kegel, 44 South Galena avenue; Newburg, N. Y., 17 members, secretary, L. Levy, 7 Water street; Malta Motorcycle Club, Buffalo, N. Y., 14 members, secretary, Will-

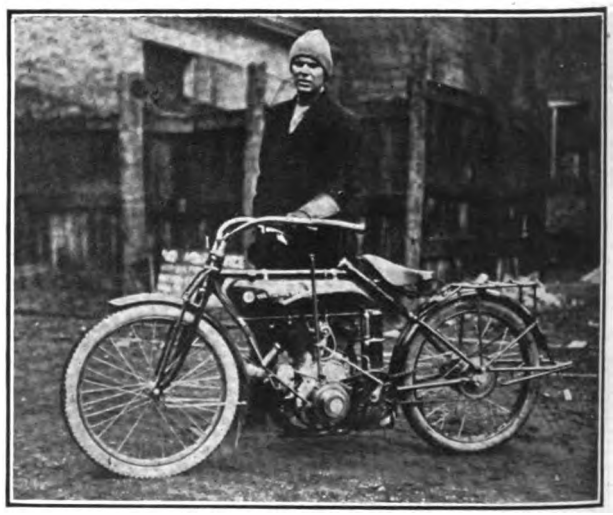
secretary, George A. Swartz, 819 College boulevard, Ashland.

Will Distribute Flying Merkels.

The Miami Cycle & Manufacturing Company, Middletown, O., maker of Flying Merkel motorcycles, has appointed the following distributors: B. B. Millison, Steubenville, O.; Standard Auto Company, Coshocton, O.; K. I. Konvalinka, Mason City, Ia.; W. F. Martin, Washington Courthouse, O.; A. Buckham, Edmonton, Can.; Behrens & Bushnell, Ivoryton, Conn.; R. W. Snipes, Americus, Ga.; Hesse Motor Company, Leavenworth, Kan.; Charles Sackett, Keene, N. H.; W. W. Cooper & Co., Ashland, O.; Miller & Co., Bradford, O.; J. P. Wolf, York, Penn.

Los Angeles "Sunset Ramble."

The Los Angeles Motorcycle Club, Los Angeles, Cal., is preparing plans for its 10 days "Sunset ramble," which will take the place of the annual endurance run. There will be numerous divisions, each in charge of a competent lieutenant, and at the end of each day's run a banquet and entertainment will be held. The distance to be covered during the 10 days will be 853 miles, through the mountains and along the seashore. The itinerary for the trip will be as follows: Los Angeles to Santa Barbara, San Luis Obispo, Hanford, Merced, San Jose, Paso Robles, Pisneo Beach, Santa Barbara and return to Los Angeles. S. H. McCulloh, secretary of the Los Angeles club, 449 West Jefferson street, that city, can furnish information to all inquirers. The ramble is open to motorcycle riders throughout the country.



Motorcyclists Guard President Wilson.

Among the many precedents that have been discarded by President Wilson is that under which former presidents have carried a uniformed aid with them in the automobile. President Wilson has substituted two motorcycle officers and will be guarded by them hereafter in his drives about Washington. The change was made the day after the inauguration. Greater personal safety is held to be assured as the motorcycle officers can watch both sides of the street, whereas the uniformed guard who rode in the automobile could see but one side easily. And in case pursuit is necessary no dependence is placed on the automobile.

Promotion for Mershon.

C. R. Mershon, who has been travelling over the entire country in the capacity of service man for the Miami Cycle & Manufacturing Company, Middletown, O., in the interest of Flying Merkel motorcycles, has been called in from the road to become final inspector and chief of the inspection department. He now has under him about 25 testers and every machine that leaves the Flying Merkel factory will be thoroughly tested on the road before being shipped.

Mershon has had an interesting experience in the motorcycle field. He is a native of Iowa and graduated from the bicycle business. He has visited every state in the Union and began selling Merkels in 1901 on the Pacific Coast. For three years he was on the Kansas City police force, and

C. R. Mershon as Travelling Representative for Flying Merkel Motorcycles.

besides riding a machine on his tour of duty had complete charge of the department's 38 motorcycles. He left the police force to take the trav-

elling position from which he has been promoted because of his indefatigable efforts on the road.

Motorcycles in South Africa.

Three years ago, motorcycles were used very little in Port Elizabeth and vicinity, in Cape Province, South Africa. There has been a decided change and these vehicles are now to be seen everywhere. There are now in Port Elizabeth 75 machines, of which probably 25 have side car attachments. An enthusiastic motorcycle club has been formed and several race meetings have been held recently.

Seeks Dr. Thornley's Place.

P. I. McIntyre of Cleveland, O., has announced his candidacy for the chairmanship of the F. A. M. competition committee, to succeed Dr. J. P. Thornley, the present incumbent. Mr. McIntyre was formerly a bicycle rider and is now

Claude E. Crout, Hyde Park, Mass., and His Eagle Twin.

a promoter of wrestling and boxing matches in Cleveland. He is president of the Cleveland Aerie of Eagles and names as references Francis Connery, city clerk; Philip McKenna, city solicitor; Thomas McHale, auditor of the Brunswick-Balke-Collender Company, and Thomas M. Cannon, high chief ranger of the Catholic Order of Foresters, all of Chicago.

Motorcycles in the Navy.

While the motorcycle is becoming well known for its usefulness in the United States army, it has also made some progress in the navy. It is impossible, of course, for the naval officers to spin over the deep, but with a keen anticipation of motorcycling possibilities while in port, several of the officers on the United States battleship Wyoming carry machines aboardship. When they are in port the motorcycles are removed from the special lockers in which they are stored, swung to a lighter by an electric crane and taken ashore. The officers thus have an opportunity to secure a more intimate view of the many countries which they visit.

Pleased with His Eagle.

Claude E. Crout of Hyde Park, Mass., rides an Eagle, made by the American Motor Company, Brockton, Mass., and he is so well pleased with his mount that he finds it impossible to express himself except in rhyme. Under the title of "The Eagle's Flight" Crout contributes the following:

When you see a rider go by
With a satisfied look in his eye,
With a silent exhaust
Running smooth as a ghost
It's an Eagle.

Then to catch him, you try with your might,
But he always is just out of sight,
You tinkered, and my! how you swore,
But the other guy always had more
On his Eagle.

'Round the bend with a swoop and a tear,
But you find that nothing is there
But a whirl in the dust
And the sound of the rush
Of the Eagle.

There's a hill right ahead that you know
Makes most of the boys go quite slow,
But somehow the hill
Was not the same pill
For the Eagle.

You arrive at the top with disgust
Seeing only a hole in the dust.
Well, it's no use to kick
If you made the wrong pick.
Get an Eagle.

That Stolen Merkel.

Recently The Automobile Journal called attention to the loss of a six horsepower Flying Merkel twin, with V type motor, bearing the factory number 3988, but neglected to state that when stolen the machine carried a Michigan license No. 2185 for 1912, and was the property of R. K. McCotter, Rochester, Mich. The Federation of American Motorcyclists pays a reward of $25 for the return of a stolen machine.

Hoover Organizes Ball Company.

L. J. Hoover, formerly manager of the Flanders Manufacturing Company's ball department, who purchased the ball machinery and the finished and unfinished stock of the receiver, will move his purchases to Ann Arbor, Mich., about June 1, when the new Hoover brick and concrete factory will be completed and ready for occupancy by the Hoover Steel Ball Company, which Mr. Hoover has organized. Associated with him are Frank Smith and C. E. Bowling, who have been engaged in the business for the past 15 years. Mr. Hoover has engaged in the ball making industry for 19 years, having at one time been

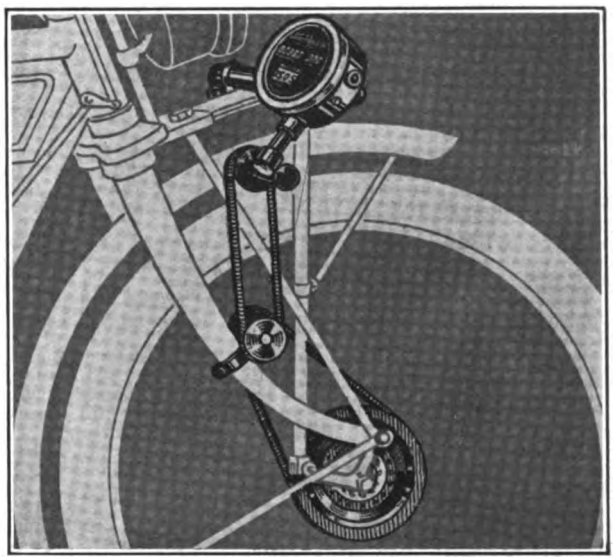
Digitized by Google

superintendent of the Standard Roller Bearing Company and later one of the organizers of the Grant-Hoover Company.

Club Notes, Here and There.

The riders of Morgan Park, Ill., recently organized a motorcycle club, with a membership of 26 at the start, and plans are being laid for endurance runs and other competitions.

Northeast Baltimore, Md., now has a rider's organization which will be known as the Broadway Motorcycle Club, with headquarters at 1401 Broadway. The club has 10 members and the officers are: President, George W. Lowery; vice president, Harry Nickels; secretary and treasurer, William Johnson; captain, P. Allard.



The Blue Island Motorcycle Club, Blue Island, Ill., has elected the following officers: President, B. Souerbier; vice president, George Robb; secretary-treasurer, E. P. Bauch; captain, W. Koenecke; directors, Charles Habich and William Jebens.

The Yale Motorcycle Club of Chicago has established club rooms at 1444 Hudson avenue.

A club has been formed at Dodge City, Kan., which has become affiliated with the F. A. M.

New Stewart Motorcycle Speedometer.

The Stewart-Warner Speedometer Corporation, 1826-1852 Diversey boulevard, Chicago, is presenting a new motorcycle speedometer of the magnetic type. The feature of the instrument is the provision made for the drive. As will be noted from the accompanying illustraton this consists of a two-belt arrangement, which is held to eliminate all possibility of vibration from jolts or jars. The front wheel driving pulley is solid steel, nickel finished, and the transmission pulleys are fibre. It is maintained that the belts grip

New Magnetic Type Stewart Motorcycle Speedometer with Two-Belt Drive.

the grooves in the pulleys and cannot slip.

The instrument is patterned directly from the automobile speedometer and is made on the same automatic machinery by the same skilled and experienced workmen. The dial is jet black, and the speed and odometer dials are pure white, so that the large figures can be read easily at a glance. The speed dial is operated by a polished steel magnet. The three-inch dial face also carries a Stewart odometer with a season register of 100,000 miles and a trip register with a capacity for 100 miles and repeat. The latter may be reset to any mile or any tenth of a mile, without disturbing the record of the season register in any manner. Full information will be furnished upon application to the home office of the company or any of its many branches in the principal cities.

INDIAN RIDERS

Cold weather is here. Motor turns over hard. Very hard work to get started. A little kerosene or gasoline injected into cylinder head will remedy this at once. A priming cup is needed in top of cylinder head as it takes too much time to take out spark plug each time. Indian riders, send at once for a finely made and finished priming cup to fit top of cylinder head of your Indian. Price, postpaid, $1 each. Money refunded if you are not satisfied.

WITH THE MANUFACTURER AND DEALER.

The following concerns have been incorporated recently to manufacture or deal in motor cars, accessories, etc.:

Auto Adjunct Company, Melrose, Mass.; A. W. Eldredge, E. J. Sanderson, J. E. Knapp.

Paige-Detroit Auto Company, Little Rock, Ark.; $10,000; J. F. Jones, W. M. Rankin, W. M. Lewis.

Motor Oil & Gas Company, Tulsa, Okla.; $10,000; J. W. Hocker, John Rose, C. S. Walker.

Hobart Manufacturing Company, Troy, O.; motor driven machinery, purchasing assets of Hobart Electric Manufacturing Company; $1,600,000; H. L. Johnston, W. E. Bowyer, E. E. Edgar, W. W. Cope, J. M. Spencer, J. S. Combs.

Henschel Tire & Rubber Company, Inc., New York City; $10,000; Rudolph Henschel, Anna Henschel, William A. Wollman.

American Manufacturing & Distributing Company, Louisville, Ky.; automobile supplies; Harry L. Archey, P. H. Block, H. B. Morrow.

Peerless Tire Company, Inc., New York City; $15,000; Michael Schiavone, George P. Calenda, Louis Schiavone.

Motor Coach Company, Inc., New York City; $500,000; automobiles, motor car hearses and burial coaches; Samuel Richenthal, Elbert R. Benyunes, Herman Miller.

Associated Auto Mechanics, Inc., New York City, $100,000; automobile parts, etc.; H. Barnes, C. Tichsnor, W. J. Hoover.

Motor Sales Company, Fort Wayne, Ind.; $10,000; automobiles, supplies, accessories; Carl J. Weber, William J. Ross, William H. Bensman, Thomas M. Connell, Charles Galex, W. H. Hess.

Harbar Auto Heater Company, Augusta, Me.; $300,000; to construct, operate, market and deal in all kinds of motor vehicle attachments and accessories; R. S. Buzzell, L. J. Coleman.

Washington Street Garage Company, Green Bay, Wis.; $10,000; K. E. Fosha, L. R. Larson, F. L. Fosha.

Auto Service Company, Uniontown, Penn.; $5000; C. W. Johnson, Fred A. Close, F. B. Hess, R. M. Campbell, Max Hannan, E. G. Snyder, J. C. Donahue, G. T. Lewis, D. D. Haroder, A. E. Corns.

Stafford Illuminated Auto Lamp & Number Company, Chicago; $50,000; to make automobile accessories; F. S. Stafford, W. Doran, F. W. Schaub.

Norwalk Motor Car Company of New York, New York City; $35,000; P. Lyndon Bryce, Alfred L. Kirby, Edward S. Murphy.

Shepherd Auto Company, Inc., New York City; $5000; Irving R. Shepherd, Fannie R. Shepherd, Joseph A. Shepherd.

WITH THE MANUFACTURERS.

The Allen Wrench & Tool Company, Providence, R. I., has closed a contract with W. A. Bryte, 788 Mission street, San Francisco, Cal., manufacturers' agent. Mr. Bryte will handle the Allen friction wrench in all the western territory, including the Pacific Coast region.

The Standard Roller Bearing Company, Philadelphia, Penn., maker of steel, brass and bronze balls, ball and roller bearings and axles and steel castings, has opened an office in the State Life building, Indianapolis, Ind., in charge of L. M. Watkin, Jr. Owing to the big demand for the company's product it was found necessary to divide the territory formerly covered by the Chicago office.

The American Motors Company, Indianapolis, Ind., maker of American cars, at a meeting of its stockholders, re-elected the entire board of directors and also the following officers: General manager and chairman of directors, V. A. Longaker; president, J. I. Handley; vice president, D. S. Menasco; treasurer, J. D. Bright.

R. B. Tracy, western manager of the Michelin Tire Company, Milltown, N. J., has opened a new branch at 1106 Hennepin street, Minneapolis, Minn. This branch will care for the territory of North and South Dakota, Minnesota and Northern Wisconsin.

The Henderson Motor Car Company, Indianapolis, Ind., maker of Henderson cars, announces the appointment of Harry W. Doherty as northwest district manager with headquarters at Tacoma, Wash. Mr. Doherty enjoys a wide acquaintance in trade circles.

Treasurer A. R. Erskine of the Studebaker Corporation, Detroit, maker of Studebaker cars, announces the appointment of Charles D. Fleming as assistant to the treasurer.

H. W. Miller has been added to the sales organization of the Lozier Motor Company, Detroit, maker of Lozier cars. Mr. Miller was formerly connected with the sales department of the Studebaker Corporation, Detroit, maker of Studebaker machines, under Paul Smith, now sales manager of the Lozier company.

Charles de Fremineville, technical director of Panhard & Levassor, maker of the first car produced in France, the Panhard, is at present visiting the American automobile industry as the guest of President R. D. Chapin of the Hudson Motor Car Company, Detroit, maker of Hudson cars.

Harvey M. Briggs has succeeded Otto R. Bieler as engineer of the Lord Baltimore Motor Car Company, Baltimore, Md., builder of Lord Baltimore trucks.

William R. McCulla has taken a position with the Packard Motor Car Company, Detroit, maker of Packard cars and trucks, as assistant research engineer. Mr. McCulla has had a wide experience in the automobile industry.

Harold D. Bornstein, well known in Boston and New England as a member of the staff of the Boston branch of the Velie Motor Vehicle Company, Moline, Ill., maker of the Velie line, has joined the Boston sales force of the Premier Motor Car Company, Indianapolis, Ind., maker of Premier machines.

C. W. Thompson, Rochester, N. Y., formerly New York state distributor for the Cutting Motor Car Company, Jackson, Mich., maker of Cutting cars, has become identified with the Keeton Motor Company, Detroit, maker of Keeton automobiles, as sales representative for New York State.

The Coronet Manufacturing Company, Wade building, Cleveland, O., has taken over the manufacture and sale of the Coronet hub mile recorder, which, it was announced several months ago, was made by the Servis Recorder Company of the same city. The Service travel recorder which the Servis Recorder Company has been marketing for the past two years is still controlled by that company. Both concerns are now entirely distinct, neither having an interest in the other or its products.

The Stewart Motor Corporation, Buffalo, N. Y., maker of Stewart light delivery trucks, has appointed the following additional agents: Ontario Motor Car Company, Toronto and Ottawa, Can.; E. L. Jordan, Auburn, Me.

The Palmer & Singer Manufacturing Company, New York City, maker of Palmer-Singer cars, has closed contracts for the following agencies: Harry A. Clapp, Boston, Mass.; Mason's Garage, Newburg, N. Y.; Mechaley Auto Company, Stamford, Conn.; Maritime Motor Car Company, Vancouver, B. C.; W. P. Lathrop, Louisville, Ky.; Boye & Emmes Auto Company, Cincinnati, O.; Southern Tier Motor Company, Elmira, N. Y.

The Brown Commercial Car Company, Peru, Ind., maker of Brown trucks, has designated the following distributors: Engles Motor Company, Newark, N. J.; J. Fred Wilcox & Co., Joliet, Ill.; F. B. Price, Elizabeth, N. J.; South Brooklyn Auto & Livery Sales Company, Brooklyn, N. Y.; Norwalk Motor Car Company, New York City; Brown Car Corporation, New York City; Ritter Automobile Company, Madison, Wis.

Ernest C. Cox, formerly connected with the Texaco Oil Company as sales manager, has been appointed manager of the eastern sales and service branch of the Findeisen & Kropf Manufacturing Company at 1902 Broadway, New York City, and will conserve the best interests of the Rayfield carburetor, made by that concern.

Gerald H. Murphy has severed his connection with the Splitdorf Electrical Company, Newark, N. J., maker of Splitdorf magnetos. As assistant treasurer for C. F. Splitdorf, Inc., for seven years, Mr. Murphy was known throughout the executive departments of the automobile industry. He announces no plans for the future.

A. J. Diefenderfer has been appointed manager of the New York branch of the Lozier Motor Company, Detroit, maker of Lozier pleasure cars. He was formerly assistant manager under W. J. Mead, whom he succeeds.

The Packard Motor Car Company, Detroit, Mich., has placed a number of Packard combination ambulances and patrol wagons with the police department in that city. An accompanying illustration shows a portion of the fleet, concerning which the department officials express themselves as thoroughly satisfied in every particular. It

Digitized by Google

has been found that these machines make a decided saving over the use of horse drawn vehicles.

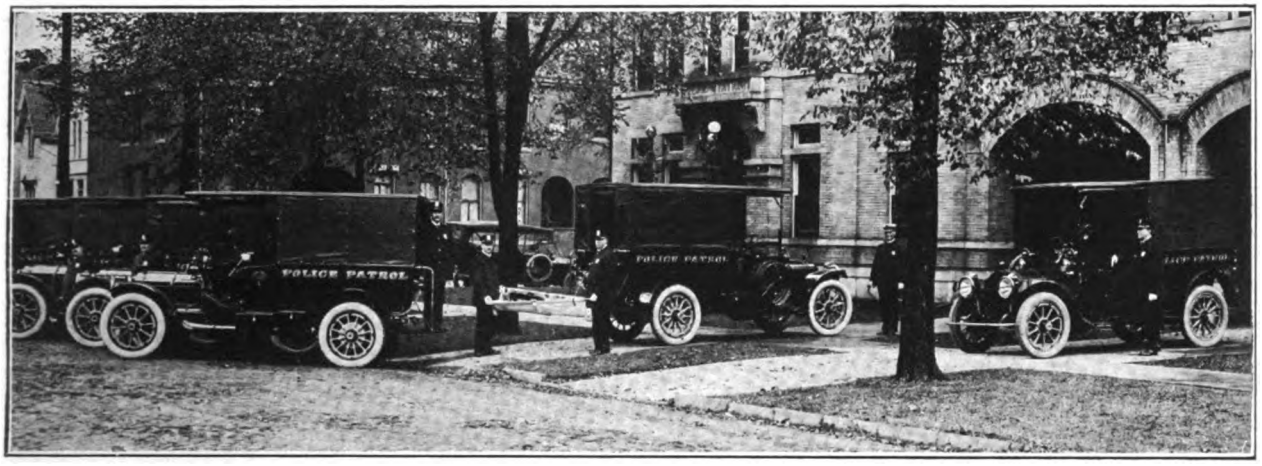
The Torbensen Gear & Axle Company, Newark, N. J., maker of internal gear drive truck axles, has concluded arrangements with Brandenburg & Co., New York, Chicago and Detroit, to act as general sales agent and direct factory representative of the company's product.

Harry S. Houpt has resigned as general sales manager of the automobile department of the American Locomotive Company, New York City, maker of Alco cars and trucks. He has been in failing health and has gone South for a vacation.

GARAGE AND DEALER.

The Hollander Motor Company, Boston, has closed a contract for the Boston agency of the Cartercar machines, made by the Cartercar Company, Pontiac, Mich. The acquirement of the exclusive rights to sell this car in this field means a greatly increased volume of business for that firm.

The Topp Garage, 134 Cortland avenue, Syracuse, N. Y., has established a first class service station in connection with its business and is enjoying a prosperous trade. Ignition and carburetion is made a specialty and expert and prompt service is given.



Snyder Bros., proprietor of the garage on East End avenue, Beaver, Penn., has enlarged the building and added a modern repair shop. The concern is agent for Detroiter and Marathon are the machines for which agencies have been secured. The president and general manager is J. G. Weihaupt; vice president, George W. Weihaupt; secretary and treasurer, J. S. Arenz; head salesman, S. Bovee.

The Auto Accessories Company, Ft. Wayne, Ind., has been formed by J. M. Cramer, formerly manager of the Fort Wayne-Auburn Automobile Company. The new company will operate a wholesale automobile business and also a vulcanizing plant.

G. W. Jones, until recently general manager of the United Motors Des Moines Company, has secured a controlling interest in the Moyer Auto Company, Des Moines, Ia., which has the state agencies for the K-R-I-T and Hudson cars. W. E. Moyer, who went to New Mexico for his health, sold his business only a few days before his death.

The Maykel Automobile Company of Worcester, Mass., has been formed with a capital stock of $12,500, and has occupied a garage on Vine street, formerly occupied by the Worcester Automobile Company. The officers are: President and treasurer, Mitchell K. Maykel; clerk, Maurice L. Kats. With Anthony Massad these form the board of directors.

The Hagerstown Garage Company, Hagerstown, Md., has sold to the Maryland Garage Company all its materials and possessions in the building on West Franklin street and has taken an office in another building, where M. I. Patterson will look after the Pullman and Regal agencies. The new company is composed of Dr.

A Portion of the Fleet of Packard Combination Ambulances and Patrol Wagons in Service with the Detroit Police Department.

Overland cars, made by the Willys-Overland Company, Toledo, O.

The Auto Parts & Repair Company has leased a portion of the Atlas Motor Car Company's former factory at Springfield, Mass., recently purchased by the Victor Sporting Goods Company, and will have a full stock of parts for the repair of Atlas cars, as well as those of other makes. P. A. Williams, Jr., formerly of the Atlas company, is manager, and Walter Parker is superintendent.

John W. Paddon, formerly of the Paddon Motor Company, Boston, who has been at Portland, Ore., for the past year, has returned to Boston to engage in the second hand car business, selling pleasure and commercial vehicles. Temporary quarters have been secured at 293 Northampton street. Negotiations are being made for the construction of a garage capable of housing 75 machines.

The Motor Parts Company, 185-187 Columbus avenue, Boston, has been appointed distributor for the products of the Bosch Magneto Company, New York City, maker of Bosch magnetos. A complete stock of magnetos, spare parts, spark plugs and other Bosch products will be carried in stock. F. W. Wilkening will be in charge of the Boston store, which is a branch of the Motor Parts Company of Philadelphia, Penn.

The Arenz-Weihaupt Auto Company has been formed at La Crosse, Wis., the Weihaupt blacksmith shops being remodelled into a first class garage and repair shop. The

R. G. Stevenson, David Stockslager and other prominent business men.

B. D. Springs & Co., a well known firm of Charlotte, N. C., was recently dissolved, when B. D. Springs purchased the holdings of his active partner, E. T. Stenerson, and also of Eli B. Springs, a silent partner. Mr. Stenerson has purchased the Charlotte Motor Car Company and will have entire charge of that concern. E. B. Springs, who also was a silent partner in that company, has retired.

The Holsman Sales Company, Des Moines, Ia., has been organized and closed contracts for the State of Iowa for the King machine, made by the King Motor Car Company, Detroit.

The Union Automobile Company, Wheeling, W. Va., is a new concern organized to handle the Abbott-Detroit cars, made by the Abbott Motor Company, Detroit. William F. Shaffer, secretary and treasurer of the Packers Motor Truck Company of the same city, was one of the organizers. Others were A. C. Shaffer, George P. Folmar, Albert M. Schenk.

The Brookes Auto Company, Steubenville, O., has purchased the Automobile & Motor Boat Company of that city, which has been placed in charge of O. L. Marquert, who will have the agencies of the Cadillac pleasure car and the Kelly-Springfield and Chase trucks. The new owner will add the Studebaker and Michigan cars, besides the Lippard-Stewart trucks.

RECENT PATENTS.

Anti-Skid Device, Frank Young, Newark, N. J., No. 1,056,081. The combination of a vehicle wheel, with a rigid collar and a set of chains, each chain being provided with a ring on one end, through which the other end is passed to form a loop embracing the tire. The chain is secured to the loop member, which is designed to hold it taut.

Sprocket Gearing, George M. Webster, Fort Dodge, Ia., No. 1,056,236. The combination of a pair of wheels each having a series of long teeth, and a series of shorter teeth forming sockets alternating with the long teeth for the reception of the long teeth on the opposite wheel, a chain on each wheel passing over the long teeth, as sprockets, and the long teeth passing through the chain when engaging the complementary sockets.

Coin Control for Vehicles, Alexander P. Browne, Cambridge, Mass., No. 1,056,147. An apparatus for automatically controlling the operation of a motor propelled vehicle by a sparking or other operating circuit provided with a closable gap, means operated by the vehicle axle for opening said gap after said vehicle has travelled a predetermined distance, and means for giving an alarm shortly before such distance has been travelled.

Automatic Centring Chuck, Ellis M. Mead, Western Springs, Ill., assignor to the Miehle Printing Press & Manufacturing Company, Chicago, No. 1,056,435. It comprises a chuck, a rotary body, a plurality of cams mounted thereon in a circle about a central space to rotate in a plane parallel to the plane of rotation of the body, and centrifugally actuated means to rotate the cams in unison.

Horn, Amedee Couesnon, Paris, France, No. 1,056,265. A hand operated horn for vehicles, comprising an air bulb, a reed, a pipe connecting with said reed, a flywheel, a pump driven by the flywheel, a pipe adapted to convey air from the pump to the first named pipe, a portion of the second named pipe adapted to be spaced from it, said first named pipe constituting an air duct from said bulb to said reed.

Storage Battery Lamp, Charles B. Bartley, Pittsburg, Penn., assignor by direct and mesne assignments to George F. Rylands, Charlerol, Penn., No. 1,056,393. It comprises a casing having a battery and lamp compartment and a separating partition, a battery, a lamp in circuit therewith, an insulating bar provided with a plug opening, and a switch device entirely within the interior of the casing and covered by said bar.

Wheel, James A. Lowe, North Branch, N. J., No. 1,056,107. A wheel comprising a rim, a hub and several sets of spring actuated double toggles connecting the rim and the hub. Each pair of toggles consists of two pairs of links, the outer pair being pivotally connected to the rim and the inner pair to the hub and to the members of the outer pair intermediate their ends, and bars or plate springs having their inner ends connected with the free ends of the outer pair of links.

Battery Plate Separator, Herbert E. Pratt, New York City, assignor to the Gould Storage Battery Company of the same city, No. 1,056,299. It comprises separating means for storage battery plates, embracing a separating sheet of material pervious to the electrolyte, and a sheet on each side of said pervious sheet, said last mentioned sheets being perforated and substantially impervious to the electrolyte, and secured together at their side edges about the pervious sheet.

Vehicle Jack, Hosea S. Tuttle, Minneapolis, Minn., No. 1,056,235. A jack for automobiles or other vehicles, comprising a pair of pivotally mounted arms pivoted at one end and positioned to engage the axle of a motor car outside the body thereof. Links are pivotally connected with said arms at a point removed from the free ends thereof and having a portion of said links extending beyond the arms, said links being a part of a toggle for moving the arms about their pivots, and means for operating the toggle.

Valve Controlling Mechanism, Joseph Lawrence Edland, Bloomfield, N. J., assignor to Herman Jules Koehler, East Orange, N. J., No. 1,056,518. It comprises a conduit having a plurality of outlets, valves controlling said outlets, a series of spring connections within said conduit, one for each valve, said connections tending to hold all of said valves in predetermined positions, a rock shaft formed with a pair of projections for receiving one end of each of said springs whereby the tension of the springs is varied as the rock shaft is moved.

Hose Clamp, Sidney J. Linton, Groveland, N. Y., No. 1,056,188. The clamp comprises a flexible band having a pair of hinged sections, one of which has an opening therein and the other being provided with a reduced portion adapted to pass through the said opening to form a complete loop around the article to be clamped, the loop engaging the article throughout in a plane perpendicular to its longitudinal axis, a yoke having a transverse recess engaging the hinge between the sections, and means for holding the yoke in engagement with the ends of the band.

Tarvia

Preserves Roads
Prevents Dust

River Parkway, Cambridge, Mass.

Cambridge's Experience with Tarvia

CAMBRIDGE, MASS., is another Tarvia town. Many of its roads have been built during the last five years with "Tarvia X" or treated with "Tarvia B". The streets of Cambridge carry an enormous automobile traffic and the problem of maintaining adequate road surfaces was a serious one.

During 1912 eight of the leading thoroughfares which had been built with "Tarvia X" received surface treatments with "Tarvia B" at a cost of 2¾c. per square yard.

The Superintendent of Streets of Cambridge reports "This treatment not only preserves the surface of the road from raveling, but renders the street dustless to a large extent. It has been found to be the most economical way to care for tar bound macadam."

In later years it will be found that additional annual treatments with "Tarvia B" will cost less each year. Westfield, N. J., for instance, found that roads which had been built with Tarvia, cost as little as 1¾c. per yard per year to maintain with "Tarvia B".

Towns which experiment with Tarvia get the habit and in time settle down to its use as a matter of consistent policy. By this means they reduce their road costs and at the same time give greater satisfaction to the citizens.

Tarvia is a special combination of refined tars especially prepared for road use. It forms a tough, plastic matrix about the stone, and prevents erosion and attrition. It is not a palliative but a cure. It does not *suppress* dust so much as prevent the attrition which *creates* dust. Booklet on request.

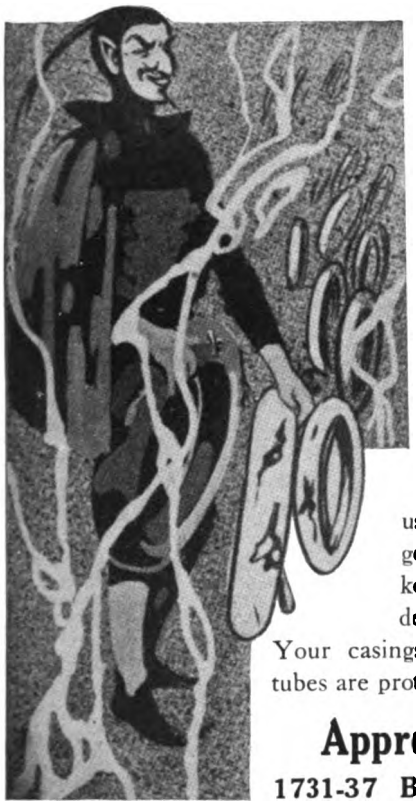
HOLD THEIR FIRST SHOW.

Dealers in Maritime Provinces Enjoy Good Business at Display in St. John.

For the first time in the history of the Maritime Provinces of Canada the public had opportunity to compare the merits of the automobiles, accessories, etc., represented in that section, at the first annual Maritime motor show in Queen's rink, St. John, N. B., March 31-April 5. In every respect the display was in keeping with the importance of the event, the Provisional Good Roads Association and the New Brunswick Automobile Association uniting with the dealers in bringing to the attention of the visitors the benefits accruing from motoring in all its phases.

The exhibition was under the able management of E. M. Wilcox, who has had abundant experience in conducting displays of like character in Ottawa, Montreal and Toronto. The visitors came from all sections of the district and seemed keenly alive to the possibilities afforded by automobiles, motor trucks and good roads. There is little doubt that the event will have material bearing upon the shaping of future policies throughout the provinces, and numerous sales were recorded.

Among those who took advantage of the opportunity to make display were the following, most of whom are located in St. John:



Cars—Maritime Motor Car Company, Ltd., Maritime; J. A. Pugsley & Co., Ltd., Russell, Reo, Ford, Gramm trucks; Motor Sales Company, Mitchell, Knox trucks and fire apparatus; New Brunswick Motor Car Company, Cadillac, Studebaker; Amherst Garage Company, K-R-I-T; L. M. Trask Company, Ltd., Brockville Atlas; Oakland Motor Car Company, Ltd., Oakland; Knox & Woodley, Metz; Tudhope Motor Car Company, Tudhope.

Sundries—L. M. Trask Company, Ltd., boats and engines; T. McAvity & Sons, Ltd., tools; Canada Cement Company, Ltd., road materials; Hassam Paving Company, Ltd., road materials; K. & S. Tire Company, tires; Elliott & Co., motorcycles; S. F. Bowser Company, Ltd., storage systems; Canada Tire Filler Company, tire filler; Zip Company, puncture preventative; Canadian Oil Companies, Ltd., lubricants; Canadian Fairbanks Morse Company, general line of accessories.

The American Automobile Association has established a branch headquarters in the Riggs building, Washington, D. C.

That automobile tires are not parts of automobile wheels and are, therefore, not subject to the duties levied upon the latter at importation is the decision of the United States general appraisers. This decision is contrary to the ruling of Collector Loeb of the port of New York, who held that tires and wheels, as assembled articles, were dutiable at 45 per cent. ad valorem.

Digitized by Google

Don't let your old tires go to the Devil use GOODMAN TIRE SHIELDS

Every self-respecting tire on the market is guaranteed to give 3500 miles of service. This means that there is sufficient rubber and fabric in its structure to stand the friction generated by 3500 miles of road service, but it doesn't cover blowouts and punctures, and that's just the reason why you can claim nothing on this guarantee.

You can make this guarantee as good as a government bond and multiply your mileage by using GOODMAN TIRE SHIELDS. You can get every ounce of wear out of your new tires, and keep your old ones still in use by using these wonderful anti-puncture, blowout and friction proof shields. Your casings need only to furnish a wearing surface if your tubes are protected by GOODMAN TIRE SHIELDS.

"There's Where YOU Are Wise!

That Other Fellow is a Menace to Everyone's Safety"

Nine-tenths of all automobile accidents are caused by skidding and by foolish dependence on rubber alone. In these days of crowded streets and congested traffic, the motorist who does not take precaution to guard against every possibility of disaster is ***next to criminal.***

"The ever-present danger that is quite as much of a terror to the experienced driver as it is to the novice is **skidding.** There is nothing that makes a man lose his nerve so thoroughly or dread a repetition of the experience so keenly as a bad skid that ends in a broken wheel against a curb, or that makes matters far worse by 'side-swiping' a moving trolley car. To feel the car start to slide from under you, aiming directly at the nearest obstruction, despite all manipulations of the wheel and brakes---well, once is too often."

Weed Anti-Skid Chains

VS.

Slipshod Traffic

Traffic policeman, by the hundreds, interviewed in all the large cities throughout the country, express the unanimous opinion that their work would be greatly reduced; that nearly all **skidding accidents would be eliminated** if motorists would take the precaution of always carrying WEED CHAINS, and putting them on when the roads and pavements are wet, slippery and uncertain, or covered with snow.

Some of these **guardians of public safety** go so far as to say that the time is not far off when State Legislatures will **make the use of WEED CHAINS compulsory,** for the protection of life and property.

Make Safety Yours

Take no chances. Fully equip your own car with WEED CHAINS and **insist,** for your own protection, that other drivers do the same.

On the Rear Tires

they afford perfect traction and adequate brake control.

On the Front Tires

they act as ladders to enable the front wheels to easily climb out of mud-ruts, car tracks and all uneven places in pavements or roads, always insuring absolute steering control, eliminating all chance of the front wheel skid.

If you haven't a set of **WEED CHAINS,** or if you have a pair for the rear tires only, **get a full equipment now.** Delay is dangerous. Stop at your dealers today and **WEED CHAIN** your car to safety.

Get Your Gasoline at Half Price by Using the M&M Economizer!

STEERING WHEEL CONTROL

The M&M Economizer **Is Positively Guaranteed** to save from 40 to 50% of gasoline, and increase the **Speed and Power** 20% with less gasoline, and less carbon. It is the only known carburetor adjuster on the market, and can be used for priming the engine. Do not throw your old carburetor away until you have applied our device. **Then Notice Results.**

With the throttle set at 12 miles per hour, by opening the M&M your mileage will be increased to 18 or 20 miles with **the Same Amount of Gasoline,** and less carbon. It is used instead of your clutch in descending grades, turning corners and slowing up for crossings, at the same time, **Using the Engine as a Brake. What the Coaster Brake Is to the Bicycle** the M&M is **to the Automobile.** The M&M also acts as a safety brake in case of back-fire.

The M&M is made with one ground valve seat and six portholes, which when open admits auxiliary air into the manifold, which is giving you a uniform mixture, and when it reaches the cylinders, it is a **Gas of the Greatest Explosive Power.** The auxiliary air which is admitted through the six portholes of the M&M is **Just Like Having Two Carburetors on Your Car.** You will never know how perfect your motor will run until you apply the **M&M Economizer.** Try an M&M Economizer for **Speed, Power and Economy.**

There Is No Screen Placed Inside of Manifold in connection with the M&M. Where a screen is used, it will clog the manifold, and make it harder for the motor to absorb the gas and air coming from the carburetor. When a car is equipped with the M&M the manifold is clear from obstructions, and the motor can **Easily and Swiftly** absorb the gas and air into the cylinders.

Read This Letter! Then watch for the next.

Morristown, Tenn.
March 27, 1913.

Moller Bros.

Gentlemen:—I have had the M&M on a **"Flanders 20"** for about two weeks, and already find it to be a grand addition in gaining speed. I can set my feed at 12 miles per hour and pick up to 25 per hour with all ease. I find that I can almost completely control my car with the M&M. I hardly ever use my brake and never use my clutch, only in extreme cases. I have made no test as yet to see the saving of gasoline, but have all reasons to believe it will save from 40 to 50% as you claim. I see no reason why it should not work on any other car as well as the **"Flanders 20,"** and if so, it is well worth many times its price. Yours Very Truly,

J. M. McCONNELL.

The above **is Just What They All Say.** They are **satisfied** with the M&M in every possible way, simply because we do not **Misrepresent It.** It does just exactly what we state. No car owner with the least bit of mechanical knowledge will hesitate to purchase the M&M, as they can easily understand **Why We Make Our Various Claims.**

The M&M Is Guaranteed to Do Just What We Claim. If Unsatisfactory in Thirty Days, Money Will Be Refunded. (Reference, Citizens National Bank, Lewistown, Pa.) No dealer or jobber is authorized to sell without our guarantee.

The M&M Economizer can be applied to any automobile or motorcycle on the market. The automobile size requires a ¾" pipe tap to insert into manifold, but same can easily be reduced to ½" or ⅛" if necessary. **Operated by Either Friction Foot Pedal or Steering Wheel Control.** The motorcycle size is ¼". The M&M is nickel plated and highly polished.

Price of automobile size, $3.50 complete for attaching (17c extra for postage). Price of motorcycle size, $1.25 prepaid.

Send for our catalog and information. **BEWARE OF INFRINGEMENTS!** Money refunded in 30 days if unsatisfactory.

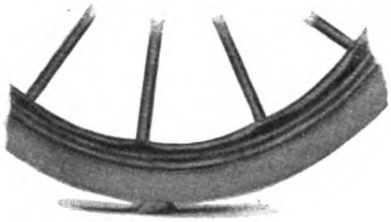
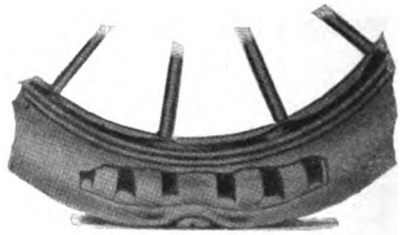
You can get the whole idea of

Dayton Airless Tires



and why they ride smoothly from three pictures and three short paragraphs; here they are:

When a pneumatic tire strikes a stone—



the stone sinks into the tire, air is displaced and the tire passes over the stone with a certain vibration or bounce GREATER, however, than the Dayton Airless.

When a solid tire strikes a stone—

the stone cannot sink into the tire because there is no place for the rubber to "go" or expand into, except on the outside, which is not sufficient, hence, inasmuch as the tire will not yield to the stone, it rides up over it and drops down with a sharp jar or jolt, causing great damage to the mechanism of the car.

But when a Dayton Airless strikes a stone—

the stone sinks into the tire, rubber is displaced and the pier or column of elastic high grade rubber squeezes down and bulges out into the open spaces between the piers and the tire passes over the stone with a very slight vibration or bounce.

You'll want more facts—more proofs and evidence; we've plenty of it; write today for our "Catechism" a book that shows the way out of tire trouble.

Read this reminder now: Dayton Airless Tires must not be mistaken for solid or "filled" tires; they fit all clincher rims; they're made in non skid and smooth tread

DAYTON RUBBER MFG. CO., 1011 Kiser St., Dayton, Ohio

20 Miles to Gallon

Lawrence, Mass., July 13, 1912.
Gentlemen:—Enclosed find check for carburetor. I feel perfectly satisfied. It does 20 miles and over on a gallon. Can recommend it to anyone.
G. A. Schmidt.

19 to Gallon on Cadillac

Edgewater, N. J., May 21, 1912.
Planhard Co.:
I am very much pleased with my new Planhard Carburetor. I made a test of gasoline consumption from Edgewater to Hyde Park, N. Y., and return, and got a fraction over nineteen miles to the gallon. This is on my Cadillac.
John H. Hinners.

More Speed—Start Cold

Groton, Conn., Feb. 8, 1913.
Dear Sirs:—I put a Planhard on my single cylinder 6-8 h. p. Goshen engine. It gives 50 R. P. M. more than the ——— I took off. With the Planhard I can start cold or hot without priming, which few others can do.
Yours truly, E. A. Scriven.

3¾ More Miles

When Planhard Carburetors were put on the 6 cylinder, 4 cycle Frisbie motor of the fast boat Delphi II, she increased 230 R. P. M., and 3¾ more miles per hour.

Much More Power

Bath Marine Construction Co.—"The gasoline consumption at normal power was better than others and it would develop much more power when pushed." H. D. Bacon, President.
"Fifty miles without a miss."—Geo. E. Grosvenor, Crescent, Mich.
"To use the vernacular, 'some carburetor.' "—W. R. Fleming, 3311 Broadway, N. Y.

If you own a FORD!

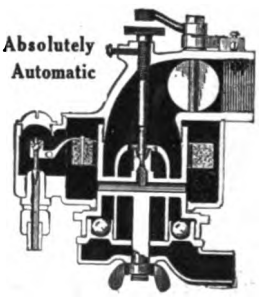
Chicago, Ohio, July 1, 1912.
Gentlemen:—The Planhard Carburetor for my model S Ford Car is very satisfactory. I never bought anything for my car I paid so cheerfully for, as I have a smoother running engine with more power and get *more mileage per gallon* and my engine runs much cooler.
H. W. Grandon.

Gallon Less Per Hour!

on semi-speed boat
HARTFORD III
owned by A. N. Smith, Portland, Maine, who gets better control.

Old Glory II

had a Planhard on her Loew-Victor on her famous trip to Nova Scotia.



Valient II and Alfred S

took all their prizes with Planhards on their Metropolitan motors.

Emerson III

made a mile in 1 minute 8 seconds over the Washington government course with Planhards.

The "Black Eagle" Spark Plug

PATENTED

50 Cents Is Enough

The "Black Eagle" Spark Plug has made good because it was designed and manufactured with this result in view.

A person in close touch with the supply and manufacturing ends of the trade was a visitor at our factory recently, and was shown the details of construction, including the machinery, testing, and assembling of the "BLACK EAGLE" Spark Plug. What he said we believe will be of interest to you, as it indicates the effort on our part to supply a high grade plug at a reasonable price. We therefore quote below his impressions.

> "I am simply amazed at the workmanship, material, and construction of the 'BLACK EAGLE' Spark Plug. When I saw this plug advertised at a price of 50c to the consumer, I naturally supposed it was a cheap, common, plug such as you occasionally find in jobbing houses on the bargain counter. I am convinced, after seeing these plugs tested, and examining minutely the machine parts which enter into their construction, that **no better porcelain spark plug is offered by any one, regardless of the price they ask.**"

We are not **influenced** by what our competitors **charge for spark plugs!** We have **ignored price precedent,** for the reason that a **high grade spark plug** can be manufactured and sold at **50c each, and that is enough.**

Sent prepaid on receipt of price. Made in all standard threads.

Don't Delay the Procession!

There's nothing much more annoying than to be the **one man** to delay the whole bunch; the **one man** whose engine stalls and refuses to start; the **one man** who gets—and deserves—the ridicule and abuse of all the rest, that takes their dust the balance of the trip. Will you continue being the **one man**? Or will you have your new car Electrically equipped as all the others are doing?

AN ELECTRIC CRANKER GETS YOU AWAY QUICK

No matter where you are or what the weather, just keep your seat—don't worry—you're off when you want to go, instantly, surely, if your Storage Battery, the heart of every Electric Cranking System, is an

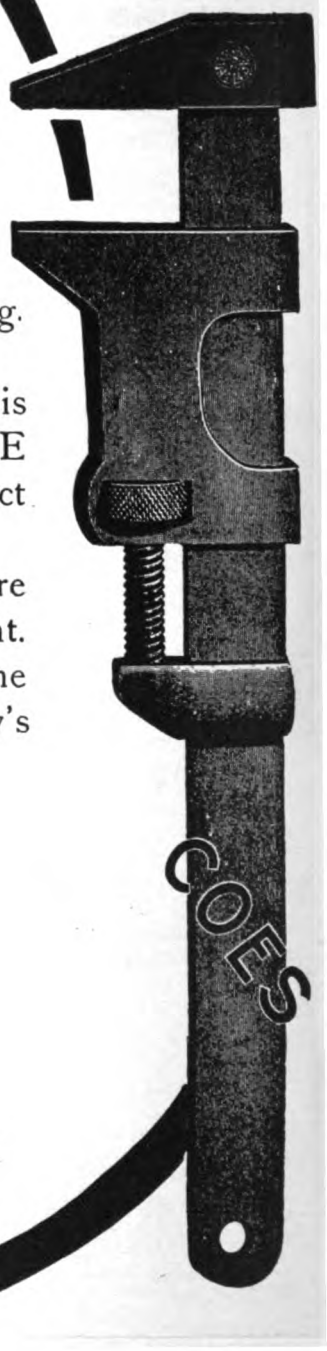
COES



THE
Wrench Supreme

Strength without bulk or clumsiness.
Ease of handling without slipping or bruising.
Perfect balance and right grip

Everything the motorist desires in a wrench is to be found in the "COES" AUTOMOBILE MODEL, and you will never know perfect wrench service until you pin your faith to it.

It stands to reason that the 5 per cent. more you pay for a "COES" wrench goes for 60 per cent. more quality and service—put this wrench in the tool kit and shop. You will get your money's worth.

You Won't Run Out of Gasoline

with a Harris' Gasoline Gauge right in front of your eyes.

How many good times have you had spoiled by running short? Some sport to have to wait until another car comes along, or else get out and walk a mile or so to a farmhouse and then get a poor quality at a high price.

No need to take any chances when you can get a

Harris' Gasoline Gauge

for $7.50

Order today and stop having to beg for gasoline

and they are easy to put on any car. Its level is constant, whether going up or down hill. No floats. No moving parts. The Harris Gauge depends on one of the simplest laws of physics for its operation. The gauge keeps perfect indications whether located above or below the gasoline level. No adjustments are necessary.

REMEMBER—If You Are Not Satisfied We Will Send Your Money Back

upon receipt of the gauge.

Get one of these gauges on your car at once, and be rid of the gasoline-shy nuisance for always. Send check, postal or express money order and we will send the gauge to you at once.

State depth of Tank, distance from top of tank to dash and whether for Gravity or Pressure tank.

THE 8-DAY HIGH GRADE "CHELSEA" AUTO CLOCK

"SPECIAL"

"OFFSET"

"ROUND"

"LIMOUSINE"

Primarily intended for use inside the bodies of large enclosed cars, and for such use its case can be given a variety of fine finishes. It also makes an attractive clock for use on dashboards. Only made in 2¾-inch size.

The Justly CELEBRATED 8-Day, High-Grade "CHELSEA" AUTO CLOCK (*Trade-mark*)

NOW and for YEARS the RECOGNIZED STANDARD of EFFICIENCY

Clocks built with a view to stand the jars and jolts and rough riding of Automobiles. Reputation the highest. Used by parties demanding the BEST.

☞ **ALL SIZES STATED ARE THE APPROXIMATE DIAMETERS OF THE DIALS.**

All are 8-day High-Grade. All are in DUPLEX (patent applied for) polished cast brass cases, the most thoroughly waterproof case on the market. The "SPECIAL" clocks show dial on an angle; its inner cased clock, when removed from the outer (locked) case, is excellent for use on mantels, bureaus, etc., when touring; its outer case is screwed to dashboard by hidden screws. The "SPECIAL" clocks are in large demand from dealers for owners of finest cars.

The MOTOR CLOCK has the same clock movement which for years we have supplied for the hard use on Locomotives, Steam Fire Engines, etc.; its dial is of same appearance as the Auto Clock dial, but the Auto Clock movement has a somewhat finer train.

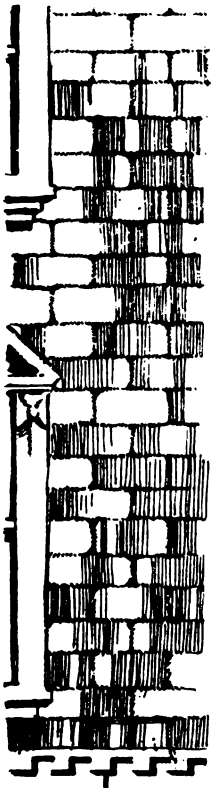
The 3¼ MOTOR "OFFSET" is likely to prove a quick, ready seller. Very attractive.

Ask for our new Auto Clock Circular and Price List, dated Oct. 1, 1911, illustrating and pricing the above and three new models, C, D and E.

PRICE LIST (Per Clock)

		"Round"	"Offset"	"Special"	"Limousine"
"CHELSEA"	2¾-in. Auto Clock.....	$26.00	$28.00	$36.00	$28.50
	3½-in. Auto Clock.....	28.00	30.00	45.00	Only made in
	3¼-in. Motor Clock.....	24.00	26.00	41.00	2¾-inch size

If wanted fitted with outside (patent applied for) stem-winding and stem-setting device—the best of its kind—**Add $3.00 to above Price Lists.** (Such device we do not apply to the "Motor" Clocks or "Special" Auto Clocks.)



For Use on AUTOMOBILES and MOTOR BOATS

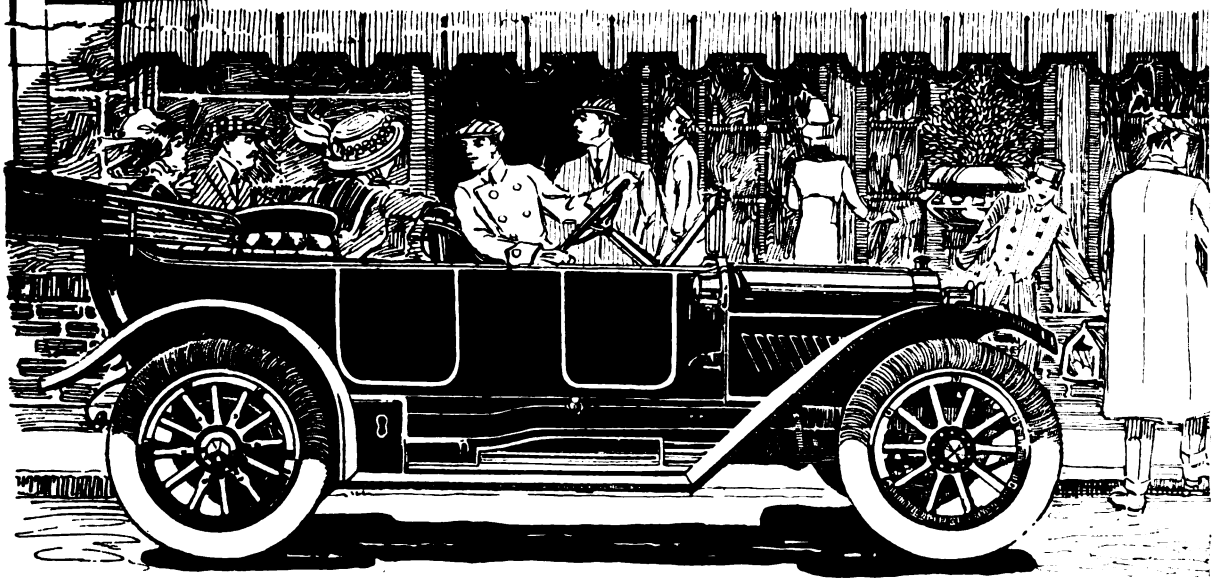
Abbott-Detroit

THE ONE PERFECT CAR

THOSE who have been analyzing the season's productions and are making an unprejudiced study of motor car values, unanimously declare that all honors go to the Abbott-Detroit.

The Abbott-Detroit maintains its position as leader of motordom. It is the incomparable and unapproachable car. Persons already intimately acquainted with this superb line have an even greater appreciation of its superior value than before. Every owner is fully convinced of the wisdom of his choice.

Some lines you have perhaps passed by with no more thought of buying or selling than were you a customer looking for all-wool goods and nothing but cotton were shown you. But when you considered the Abbott-Detroit you at once recognized the genuine article. You were unable to find any other car that offered such beauty, comfort and mechanical perfection at anything near the price and nothing in all-around qualities that could excel at any price.



We cannot put the truth too strongly. We are dealing in cold, hard facts. The Abbott-Detroit is the maximum car. Ask any Abbott-Detroit owner what he thinks of his car. Those who previously owned other cars are unanimous in their declaration that the car cannot be matched at any price. This is as true with those having owned $5000 and $6000 cars as those who paid much less. Unsolicited testimonials being received daily show that in scores of instances the 1912 model Abbott-Detroits have been driven from 10,000 to 20,000 miles through all sorts of weather and road conditions without a single cent being spent for repairs.

If as an owner you want a car that will give you the same consistent service year after year, you should buy an Abbott-Detroit. As a dealer you will hold your trade and insure future success by handling the only perfect and reliable car.

AMICO

WHY WORRY ABOUT YOUR SPARK PLUGS

Why not equip now with the AMICO plug—non-leakable—un-breakable—the SERVICE plug, with the LONG LIFE. Absolutely the only plug made that will give guaranteed service. Note below its unique features. Try a set—if they are not as good as we claim, we refund your money cheerfully.

$1.00 EACH

High tension electrical porcelain of large diameter affording extra strength and durability—almost impossible to break.

Vamped ridge—holds porcelain rigid at uniform pressure.

Asbestos packing set in taper seat ensuring perfect protection from explosion chamber—perfect joint, no leakage, each explosion blows clean the exposed parts in cylinder. Construction allows porcelain to expand on incline. Old types of plugs have square seat with no chance of expansion either way.

$4.00 the Set

The porcelain has an annular ridge which affords protection to the asbestos packing from the explosion.

Order a set to-day from your jobber or dealer or order direct. We pay Parcel postage. State size of thread

PUBLISHER'S PAGE

The Circulation of the Automobile Journal is 16,886 copies the issue. 90 per cent. reaches car owners. This distribution is equal to that of any American motoring magazine that has an owners' clientele. All subscriptions are paid for at regular rates in advance, and no orders are for less than one year.

1913 Pleasure Car Specifications

Gasoline Now Ready For Distribution Electric

You would like to know all about mechanical details of the cars made in this country, be in position to answer any question that can be asked of any constructional feature of any car, and through the possession of such knowledge be able to compare and pass on any mechanical detail?

The specifications are published in book form and the contents include: Names and addresses of manufacturers, classifications of cars by prices, alphabetical list of all models, complete mechanical details, illustrations of models, buyers' reference. All are indexed, making it possible to secure all facts desired at a moment's notice.

Price 50 Cents, Postpaid

Gasoline 1913 Commercial Car Specifications Electric

These specifications, published in book form, are now ready for distribution. They are absolutely accurate and the mechanical data were furnished by manufacturers.

They are an encyclopedia of commercial car mechanical constructional facts, and a reference that is complete, giving information that cannot be secured through other sources.

All copies give mechanical details, capacities, prices, illustrations of models, names and addresses of manufacturers.

Price 50 Cents, Postpaid.

THE MOTOR TRUCK

The conditions that confront the service wagon and allied industries and interests are of such vital importance that all concerned, directly or indirectly, must unite with the owners and users of motor vehicles for preservation of their enterprises and the protection of those using the streets and highways for transportation.

The MOTOR TRUCK was the first magazine devoted to service motor wagons to systematically analyze conditions of actual use, and to publish facts demonstrating the possibilities from the continued experience of others.

In the May number will appear several articles upon these vital issues, which, while directly affecting the motor vehicle industries and trade, will have a material bearing upon the people as a whole.

The MOTOR TRUCK is a business man's magazine. If you are interested in highway transportation of any character, or are an owner or user of motor vehicles, every issue is worth to you many times its price. $1 the year. 15 cents the copy.

"Puts Noisy Gears to Sleep"

I-O-C
GEAR OIL

¶ I-O-C Gear Oil is the only oil ever made especially and exclusively for the lubrication of automobile transmission gears.

¶ It is absolutely different from any other oil made and possesses certain peculiar properties that cause it to face the gear teeth with a coating which is practically indestructible, and prevents wear and reduces noise and friction to a minimum.

¶ It contains no foreign matter such as ground cork, saw dust, etc., but is 100 PER CENT OIL, and being free from water and chemicals it will not foam in the case when running or allow the bearings to rust when idle.

¶ A trial will convince the most skeptical that* I-O-C *Gear Oil is better than any grease, any dope, any compound, or any other form of gear lubricant ever put on the market.

THIS IS THE LABEL

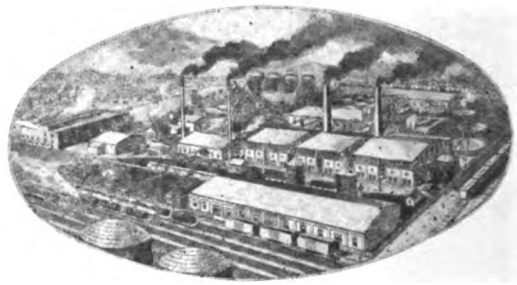
If this Label is not known in YOUR garage—then you haven't really thrashed out the question of Automobile Lubricants.

The name Emco means far more than a mere automobile lubricant at so much per gallon. It means, first of all, 40 years of knowing how. It means that the largest independent refiners in the world, using exclusively Pennsylvania Crude Oil, are willing to stake their reputation against your test of Emco oils.

UNDER THIS GUARANTEE

If Emco Automobile Oil does not prove satisfactory to YOU in absolutely every respect, we will refund you money in FULL—pay freight (both ways if oil is returned) and make no charge for oil used in trial.

Emco Motor Oils and Greases are refined from famous Bradford Crude, free from animal and vegetable matter, contain no acids, and their ideal consistency is absolutely unchanged by heat or cold. If your dealer cannot supply you, we will ship Emco direct to you in five or ten gallon cans, barrels or half barrels.



EMERY MANUFACTURING CO.

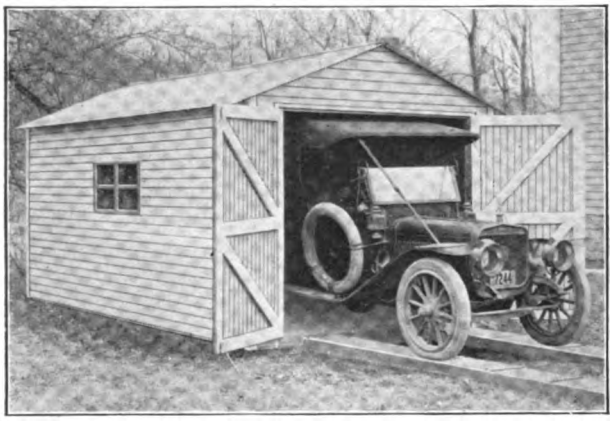
THE AUTOMOBILE JOURNAL

VOL. XXXV, No. 6 APRIL 25, 1913 Price, $1.00 the Year

ADVANTAGES OF PORTABLE GARAGES.

Why a Large Percentage of Owners House Their Cars in Private Buildings---Details of Construction, Dimensions and Prices of Types Now in the Market---Features to Be Considered in Making Selection.

RELIABLE figures secured from state officials at the beginning of the year indicated there were not less than 1,000,000 motor vehicles of all types in service in this country. The returns from Alabama, Maine, Massachusetts, Maryland, Missouri, Montana, New York, Oregon and Rhode Island, in which the registrations of pleasure and commercial vehicles were reported separately, revealed that some 85 per cent. of the automobiles in these states were pleasure cars. Assuming that the same relative proportions held true of the remainder of the country, there must have been a total of 850,000 of this type alone, and, of course, the figures have been increased materially by sales made since that date.



Were it possible to secure equally reliable information as to the capacities of the various public garages and service stations, there is little doubt that the difference between the number of cars in use and the number of machines which could be cared for in these institutions would be surprisingly large. It seems safe to assume that a majority of the pleasure cars owned in the Union are housed in private garages.

The Portable Garage May Be Made to Harmonize in Every Particular with the Residence and Other Surroundings.

Besides the economy afforded through the elimination of storage charges, which average from $20 to $35 a month, depending upon the size of the city and the local conditions, there are certain

Digitized by Google

Edwards Design Provides Ample Room for Big Winton.

advantages in the plan of having the car at home. The American motorist finds keen enjoyment in looking after his own machine, and there is opportunity for decided economy in this respect as well. The need for minor adjustments and repairs is discovered and the work is done at slight expense before it assumes important proportions.

In addition, the car is at all times under the watchful eye of the owner, and the danger from abuse at the hands of the "joy rider" is wholly eliminated. There is no mysterious disappearance of tools and equipment, and there is less liability of scratches and mars on the body work. Even the gasoline bills seem to grow less. And above all, the machine is nearby, ready for instant use at any time of the day or night. All these items spell economy.

The owner of his first machine—and many of the older owners—finds himself studying the problem of the private garage. His first step may be that of consulting an architect or contractor in an effort to determine the necessary expense of construction. Sooner or later he undoubtedly will ask himself whether or not it is possible to satisfy his needs for less money.

Irrespective of the expense involved, the garage must be a thoroughly practical structure. First of all, it must afford complete protection to the car. By this is meant that it must not only give protection from the elements, but it must insure against theft. Aside from being substantial in every particular it ought also to be attractive in appearance and of such design as to harmonize with its surroundings.

The portable garage offers in combination these three essentials—practicability, attractiveness and inexpensiveness. Elsewhere is presented a table setting forth the list price for different sizes of portable garages as produced by five concerns, and this will serve as a guide to the owner who is considering the proposition from the standpoint of first cost. Accompanying illustrations set forth in a measure the features of practicability and attractiveness.

Edwards All-Steel Garage Owned by Mayor Henry T. Hunt of Cincinnati.

Edwards Steelcote Model with Two Windows on Side.

The idea of portable buildings has become associated with the summer outing. There is little doubt that the first structures were produced solely for this purpose. The city dweller who could procure a desirable lot at the seashore or in the mountains, found it desirable to purchase a portable house for use during the summer season. Very soon there arose a demand for a building which could be left in position throughout the winter, giving suitable protection for such goods as were required during the annual vacation outing. As a result the product was perfected until it embodied permanent features as well as portable.

The portable garage is in a sense a development from the portable house. With the more general adoption of the automobile it became necessary to provide for the machine even where

Digitized by Google

the summer was spent in the most substantially constructed country house. The portable garage offers a practical solution of this problem, particularly where it is desired to store the car only during the summer months, and yet with the perfection of design and construction people of means have found it possible to consider these buildings as a permanent improvement to their country property. The structure not only remains in position throughout the year, affording protection for such tools and appurtenances as must be kept at the country place, but offering an excellent opportunity for taking a run into the country for a week end or a longer period during the milder portions of the winter months.

Some owners, instead of leaving the portable garage at their summer homes, ship them into the country in May or June and bring them back to the city in September or October, thus making one structure answer their needs in both

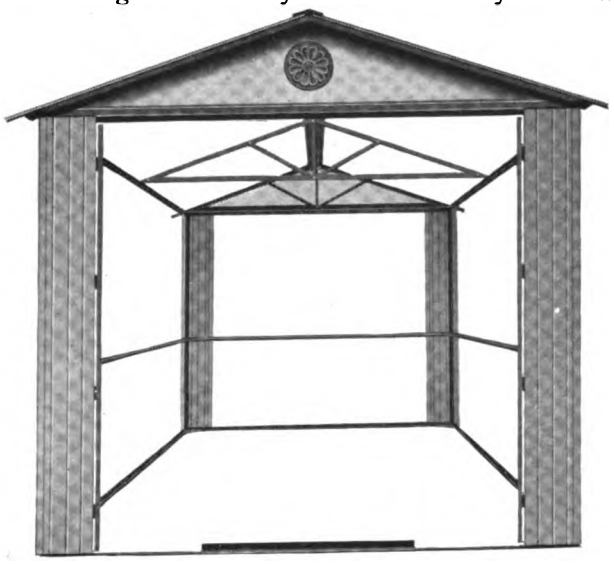
O. K. Harry Design Owner by C. S. Marsh of St. Louis, Mo.

places. Perhaps it was this plan which first brought the portable garage to the attention of the city owner as a permanent substitute for the more substantial structure. Certainly, it makes a decided appeal to the man who does not own his own home, or who desires to change his dwelling place. It is easily set up and as quickly taken down. It can be erected on rented land as well as any other, and it is readily moved with the household goods to the place of new abode.

There are a large number of concerns producing portable garages. Some of these are of wood, some are of wood and steel, others of all-steel construction, and still others of concrete in the building of which a portable feature is incorporated. That presented on the title page of this discussion is the product of F. C. Pinyoun & Son, Cleveland, O., and is of wood. The side walls are made in sections about four feet wide from .875-inch white pine siding, tongued and grooved,

Pruden One-Car Garage Owned by a St. Paul Architect.

each being a duplicate of the others and all being interchangeable. The roof is of specially prepared roofing material, and the hardware, glass and fixtures are in keeping. The whole may be painted to match the residence or harmonize with the surroundings in any manner desired.



The lumber is dressed on both sides so that the interior has a smooth and finished appearance. It is recommended that it be treated with a coat of stain and varnish to bring out the grain of the wood, thus giving a good finish at a very slight expense. No ceilings are provided, it being maintained that the dressed roof panels take their place and afford good ventilation. The sections are put up in crates of a convenient size for handling, the height of each being eight feet. A flooring may be fitted at a slight extra cost, but the standard garage is furnished with running

Pruden Two-Car Garage in Service at Sayville, L. I.

planks, two inches thick and 16 inches wide, for the wheels of the machine to stand upon. The sizes range from 10 by 12 feet to 20 by 20 feet.

First Step in Erecting Edwards All-Steel Garage: Corner, Gable and Roof Sections in Place.

One of the oldest producers of steel garages is the Edwards Manufacturing Company, Cincinnati, O., which marketed its first structures of this design in 1905. To meet the varying requirements of motorists, the company not only makes garages in any size desired, although not all are included in its standard list, but in two distinct types, one being the Steelcote and the other the All-Steel.

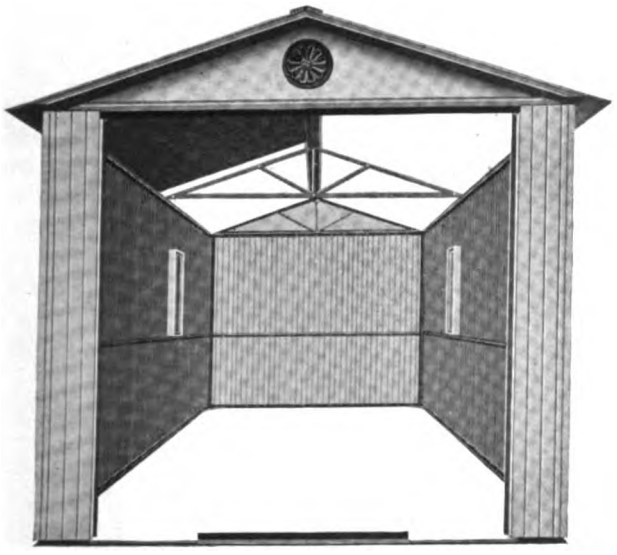
The Steelcote has a frame of seasoned wood, usually pine, covered with non-rusting galvanized steel. The entire structure, save beams, uprights, etc., on the inside, is steel, and this is made weather proof by the Edwards Tightcote process, in which each sheet of steel is resquared after stamping and before galvanizing. It is then dipped into molten lead and zinc, which throughly covers the edges as well as the sides, a condition which is held to absolutely prevent rusting.

Inasmuch as the steel sections are cut exactly to shape and ready to go into place and each piece of the frame is of proper length, the work of erecting the garage is simplified to a final degree. A foundation is not necessary, as the building may be anchored by means of stakes, but usually a cement foundation is utilized, in which event the anchors are sunk in the cement and the structure attached thereto.

The floor sills consist of two-by-fours securely spiked together. The corner posts are placed in position and the corner pieces of galvanized steel are applied before the siding, the latter being of Tightcote galvanized weatherboard resembling clapboards, and utilizing an interlocking construction that makes water tight seams and provides for expansion and contraction. The roofing is of the same material, made to represent cluster shingles, with interlocking devices and with nails concealed. A metal Spanish tile roof is furnished at an extra cost if desired.

The All-Steel model, as its name imples, contains no wood at all. The roofing, siding, window frames and doors are of non-rusting galvanized steel, and the frame of open hearth or Bessemer steel. To enter a trifle more into detail: The frame work is of angle steel, 1.25 by 1.25 by .125 inches, with holes drilled for fastening side sections. All sills are connected by six by six-inch angle plates, drilled for .3125-inch bolts securely fastened at top, bottom and centre angles. The top plate has six by six-inch angle steel plates .125-inch thick, drilled for .3125-inch bolts and riveted on one side. The sills are punched out at the door for the passage of the wheels. The door posts on either side of the door are drilled for .3125-inch bolts, the hinges being riveted to the post and the corner section.

The trusses are constructed of 1.25 by 1.25 by .125-inch angle steel securely riveted together with one vertical centre brace and two transverse stress braces, riveted in place. Each door is four feet wide and eight feet high, the frame being the same as that of the building itself, covered



Second Step: Rear and Side Sections Completed.

with galvanized beaded siding and reinforced by one by one by .125-inch angle braces, fastened in the centre with six by eight by .125-inch steel

Digitized by Google

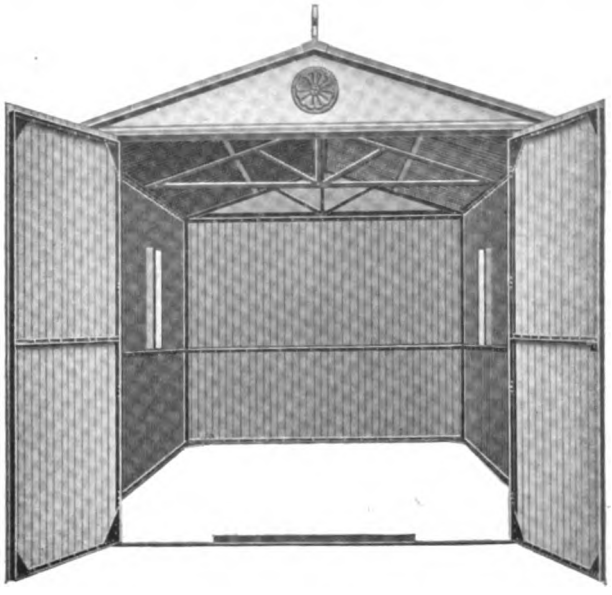
plate riveted in place. There are two doors.

The siding is Edwards patent beaded lock joint, 26-gauge, heavily galvanized by the Tight-

Third Step: Sides and Part of Roof in Place.

cote process, each section being equipped with a patented interlocking device, which locks into the stiffening bars, forming air tight joints between sections. The roofing is of the same material, securely locked by slipping into the folded part of the ridge cap and into the turned-up edge of the eave flange. The roof is further reinforced by two extra angle steel purlins, extending the entire length from gable to gable.

Metal fireproof windows are furnished in two of the side sections, each 27 by 36 inches, with two galvanized steel hinges securely riveted to each frame. These sections being interchangeable, the windows may be placed in any position along the side or end of the building. A Yale & Towne three-tumbler lock securely fastens the door and a combination lock and patented galvanized opening rod is supplied for each window.



The Metal Shelter Company, St. Paul, Minn., produces the Pruden system garage. This also is an all-metal product, the steel being thickly galvanized. The side and end walls are fastened together by studs which form a part of the integral wall after they are locked in place. The edge of each sheet is formed into a hook or bead which interlocks with the bead of the next sheet, thus forming a tube into which a rod is slipped to hold the sections together. This construction is very similar to that of a door hinge.

The rods are then bolted to the bottom piece or sill, fastening the whole wall together into one solid piece of sheet metal. The sills are of an angle iron material and are anchored to the foundation by means of specially bent clips held down by bolts embedded in the concrete.

Before being slipped into the tube formed by the heads of the two sheets the studs are put through holes in the eave pieces so that when they have been fastened to the sills at the bottom the eaves also are held in place at the top of the wall sections. The outer edges of these eave pieces are bent over to receive one end of the pieces which are slid into the slot thus made and which span the space between these eave ends and the ridge piece at the top of the roof. There is a similar slot in the ridge piece to receive the other ends of the metal roof sections. The roof sheets are fastened together by means of the beads, but there are no studs, as in the side wall sections.

Still another all-steel construction is the O. K. Harry, made by the O. K. Harry Steel Company, St. Louis, Mo. The material is 24-gauge galvanized open hearth steel, reinforced with corrugations, and angle iron. All intermediate seams in the side wall sections are double locked, there being no nails, rivets or lap at this point, a patented construction which is held to possess superior advantages. Where the roof sections lap they are provided with corrugations which are bolted together, an elastic cement being used to cover the bolts.

In erecting this garage the wall sections are laid flat on the ground and bolted together for the rear and sides. These are then raised to a

Interior View of Garage Ready for Occupancy.

perpendicular position and the angles bolted at the corners. Next the centre truss is placed and bolted to the side wall top angles, then the rear

Digitized by Google

and front truss in like manner. The roof sections are lifted into place separately and bolted as outlined above. The ridge cap is the last

Standard Model Produced by Riverside Manufacturing Company.

piece to be placed, securely locking the assembly.

Except for the individual design and the difference in the application of the principle, the numerous other steel portable garages made throughout the country may be said to be similar to those already described. The building made by the Riverside Manufacturing Company, Newark, N. J., shown herewith is an example of standard construction in this respect.

The advantages of the steel building include that of complete fire protection. As a rule the makers claim that they comply with all the requirements of the board of fire underwriters, resulting in a reduction in fire insurance premium. Not only do they protect the car from fires originating outside the garage, but in case the fire arises inside the building, it cannot communicate to other structures.

The same thing holds true of the concrete garage, and while this material usually is employed for permanent buildings, David Craig of Boston, Mass., has invented a method of construction by which he claims it is possible to secure a portable feature. An accompanying sketch brings out the details, and a little study of the drawings should make the principle clear.

The chief essential is what is termed the Craig reinforced screw bore presented at B. This is fixed in the slab of concrete by first inserting a master bolt into the hole which has been prepared and located in the mold as shown at C. The wire screw bore is then imposed upon the master bolt. If reinforcing rods are used, they may be placed in position and the ends of the wire wound around them. The mold is then levelled and poured full of concrete. When this has hardened the sides of the mold are removed and the master bolts taken out, leaving the reinforced screw bore correctly placed and imbedded in the slab or unit.

The drawing at A indicates the method of constructing the building, and it will be noted that virtually three slabs are utilized, the screws fitting into the screw bores in the several slabs so as to hold the entire building together. It follows that it should be a simple matter to remove these screws and take the concrete slabs to the new location for the re-erection of the garage wherever desired. In fact, the inventor claims that the only tools necessary for the construction

Digitized by Google

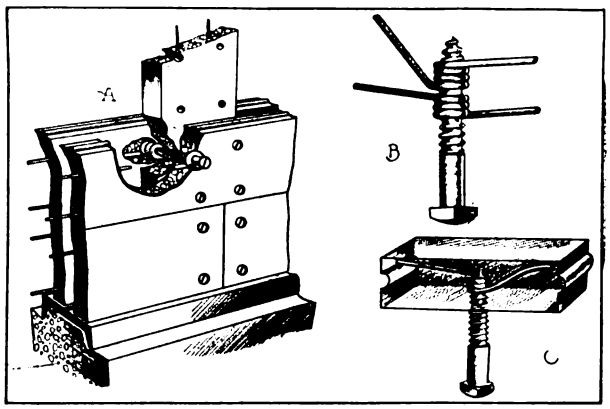
or demolition of the building are a monkey wrench and a screw driver.

When considering the matter of a private garage, the owner does well in not deciding upon a building that is too small. He may consider the length of his car and add a few feet extra, thus securing a building which furnishes shelter for the machine. In so doing he fails to remember that while he may have a small car at present, another year he may decide upon a larger one, or that while he does not expect to do work upon the machine, he may find it expedient to do so later.

This feature of the situation has been covered fully in a series on equipping the private garage now running in The Automobile Journal. However, since it has a more or less direct bearing upon this subject, it is not out of place to call attention to the desirability of securing a garage having plenty of available space. In determining this point it will be necessary to consider not only the wheelbase of the car, but its maximum length from the front of the radiator to the rear of the top when lowered, and to this must be added the number of inches which the wheels extend beyond these points of measurement. The maximum width of the machine, and its height with top up and down also are items of importance. These dimensions must be known first of all, before determining upon the space to be allotted for work bench, etc.

As a partial guide in this matter it may be stated that the Metz runabout, for instance, with a wheelbase of 90 inches, has a maximum length of seven feet six inches, width of 63 inches, height of five feet with top lowered and six feet six inches with top up. The Ford touring car, with a wheelbase of 99 inches, has a maximum length of 11 feet two inches, width of 66.5 inches, height with top down of five feet and with top up of seven feet one inch.

That there is a wide difference in these dimensions may be seen by reference to the figures for a few of the larger machines as given by the manufacturers. The following table gives these dimensions in inches, and in each instance the largest so-called open car made by the company in question is considered:



Make	Wheelbase	Length	Width	Top Up	Top Down
Overland	114	154	66.0	84.0	65.00
Cartercar	115	158	70.0	87.0	66.00
Paige	116	169	64.5	82.5	61.25
Mercer	118	180	84.0	82.0	75.00
White	132	180	69.0	....	....
Knox	134	199	67.0	91.0	69.50
Oldsmobile	135	201	71.0	90.0	66.00
Peerless	140	193	68.0	87.0	65.00
American	140	202	66.5	82.0	70.00
Marmon	145	182	67.5	....	....

The importance of this feature cannot be overlooked. The standard height for the portable garages now in the market is either eight or 10 feet. The accompanying price table gives the standard length and width dimensions, some of them being for garages designed to house two cars instead of one. Other sizes than those listed may be secured from any of the makers, but at special prices.

MILLER'S GASOLINE TROPHY.

Donor Makes Further Suggestions Concerning Proposed Fuel Economy Test.

The announcement that Chas. E. Miller, the well known automobile supply man of New York and other cities, would donate a trophy for a fuel economy test to be held in the near future, has occasioned considerable interest throughout the industry. In discussing the situation further, Mr.

Sketch Presenting Details of Craig Portable Feature for Concrete Garages: A, Method of Construction; B, Reinforced Screw Bore; C, Master Bolt Inserted and Placed in Mold.

Miller outlines some of the factors which must be considered in making the award, as follows:

The gasoline fuel economy contest that I suggested recently has attracted attention all over the country, and here in New York undoubtedly either the newly formed Motor Contest Association or the Automobile Dealers' Association will very shortly promote such an efficiency test. Some criticism has been made relative to my suggestion that awards should be made on the basis of 10 miles a gallon, and I might add to that by saying that everything else being on the same plane, if the weight of the car is reduced, the fuel consumption a mile will be reduced.

But this saving is made by giving up some other desirable factor. For instance, very light racing or electric car tires might be used and on a car that uses T head cylinders, the two-point ignition would be valuable. Manual control of the gasoline or air should make it possible to use a light mixture or a heavy mixture, the latter of course on hills and where pulling is hard. Consider also the amount of coasting that the expert drivers did in our last New York City contest four years ago. In conclusion, I feel fully convinced that tests of this sort made all over the country under varying conditions will go a long way towards demonstrating the best method of fuel economy.

THE OVERHAUL OF THE POWER PLANT.

Outlining Methods of Dismantling, Cleaning and Adjusting Its Components---Parts Requiring Attention and Suggestions for Simplifying the Work.

By C. P. Shattuck.

MOTOR cars are similar to other machinery in that they require periodical overhauling, the exent of which depends upon the age of the machine, service rendered since the last renovation, and future plans of the owner. It is only natural to assume that an automobile purchased new last spring will require less attention than an older vehicle, and that aside from removing the carbon, grinding in the valves, readjusting the bearings, etc., it may be placed in first class condition for the road without much labor or expense. On the other hand, an old model will need considerable attention, including machine work and the replacement of worn parts with new.

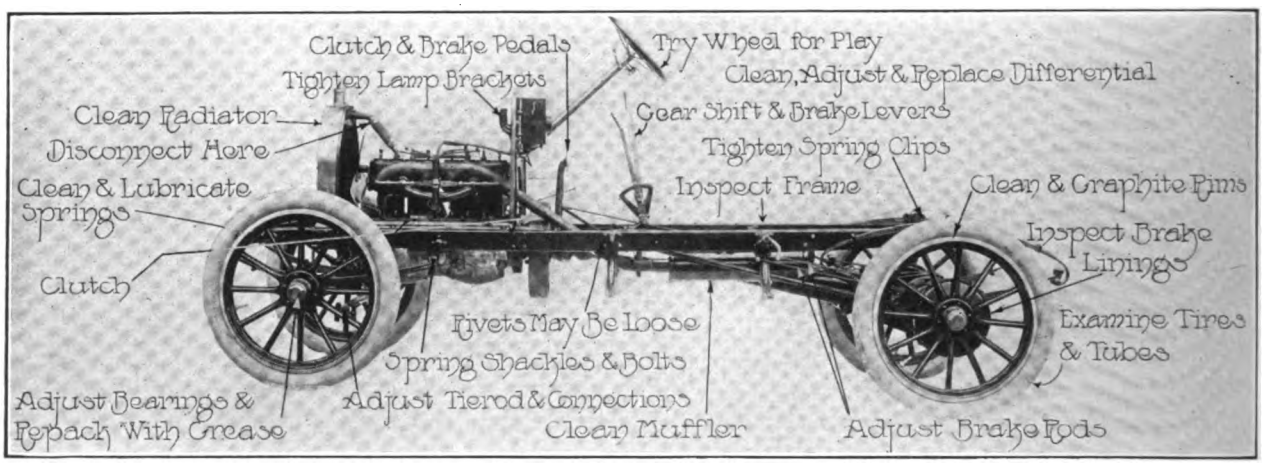

Fig. 1—Illustrating Components Requiring Attention in the Overhaul of the Chassis.

The educational campaign conducted by The Automobile Journal, judging from the large number of letters received and published in the Correspondence Department, has resulted in a large number of automobilists caring for their own cars. Although a certain class of motorists depends upon the expert, there are many who prefer to do their own work, and for the benefit of these the suggestions contained herein are given. The tools and equipment needed for the overhaul were fully described in "The Equipping of the Garage" series.

As the power plant is an important factor its overhaul will be discussed first, although the subject of clutches, transmissions and other chassis components will be taken up in logical sequence. As it is an excellent plan to thoroughly clean and inspect the chassis, even if the car has been used but one season, the removal of the body will facilitate the work. If plans have been made to paint the machine, it can be run to the paint shop and the body removed while the chassis is being overhauled. This plan will save removing and replacing the body twice.

In case it is decided not to paint the car, the accessories and equipment are removed from the body first to lighten the load. Next detach all connections between the body and chassis, making sure that the former is free before attempting to remove it. Four or more persons will be required, depending upon its weight, although with a falls and tackle it will be a simple job.

Having made ready the boxes for the small parts and arranged the work bench for the cylinders, manifolds, etc., the work of dismantling the motor may be started. Previous to the removal of the body the circulating system will require a thorough cleaning if this has not already been done. The subject was dealt with fully in the April 10 issue.

If the motor is to be removed from the chassis the work of cleaning its exterior may be postponed until it is in the motor stand. When the overhaul provides only for scraping out the car-

Digitized by Google

bon, grinding in the valves and making adjustments, the engine need not be removed, but the magneto and carburetor should be well covered before washing the power plant with the gasoline and brush or with a special cleaner.

Assuming that a complete overhaul is not necessary, the first step is to mark the wires of the ignition system so that they may be replaced correctly and easily. This may be accomplished by marking a number of small tags and attaching these to the different wires. By observing the same order in the replacement, no difficulty should be experienced in properly wiring the motor. While this work is being done the water may be removed from the cooling system by opening the petcocks under the radiator and pump.

Next shut off the fuel at the tank, and detach the feed pipe at the carburetor by unscrewing the union nut. If the oiling system includes a lead or leads to the dash, tag these before removal and place the pipes where they will not be apt to become injured. Be careful not to bend them. Although the cylinders may be cleaned of carbon without removing the units, the better method is to displace them as it affords an opportunity to inspect the rings, etc., and to locate and remedy the cause of weak compression.

Before attempting to disconnect the water pipes, study the system thoroughly. If a thermo-syphon, detach the pipes at the cylinders, and if similar to the motor shown at Fig. 1, remove the clip on the top of the outlet manifold and detach the union just above the water pump. Do not exert undue pressure upon the pipes and if the union is set up hard, tap the wrench quickly and smartly with a light hammer. Examine all rubber pipes for loose fabric and replace with new if their walls have deteriorated.

For the benefit of those who are not familiar with the enclosed working parts of a motor, the chart presented at Fig. 2 will be of value, while the exterior components are shown at Fig. 3, and by studying these the novice should experience no difficulty in dismantling and reassembling the power plant.

The grouping and location of the exterior components vary according to the design; for example, the method of retaining the intake and exhaust manifolds. This is illustrated by Figs. 3 and 4, which present conventional types of motors. At Fig. 4 the intake and exhaust are separately retained, having flanges with holes to correspond to studs in the cylinders. That at Fig. 3 differs in that both manifolds are secured in place by stirrups, the intake being held by a set screw while the exhaust is locked by the same stirrup.

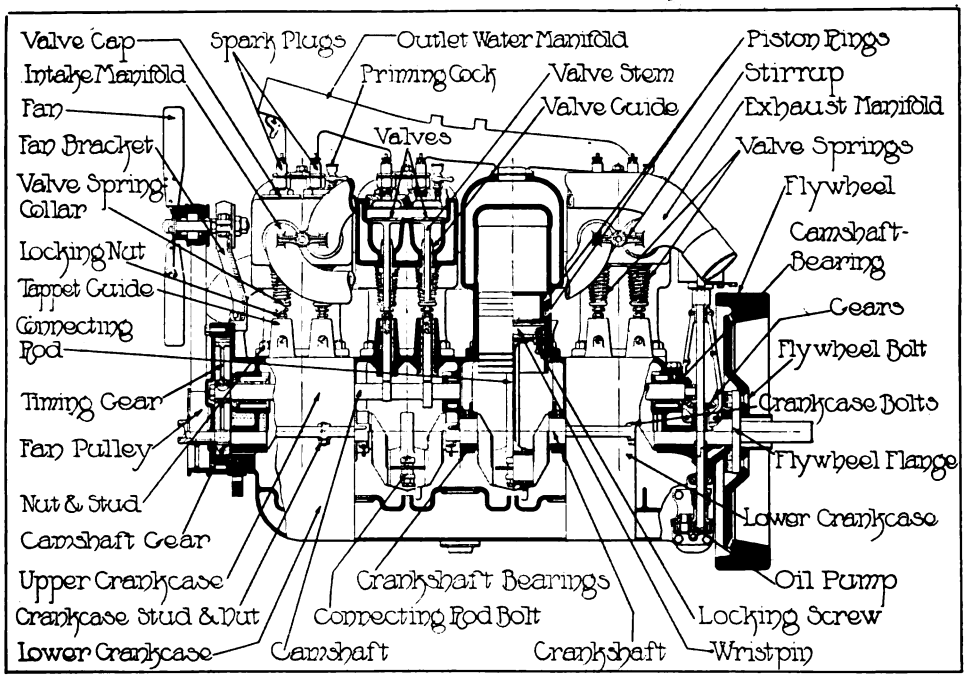

Fig. 2—Part Sectional View of Conventional Motor with Each Component Lettered to Simplify the Work of the Overhaul.

In dismantling any motor one should be systematic and at Fig. 4 is shown a motor with the exterior components alphabetically arranged, which order if followed will simplify the work.

First, remove the spark plugs a and place them to one side for cleaning, then take out the priming cocks b. The valve caps c may be removed with the special wrench and placed in order on a shelf of the bench for cleaning. Next disconnect the pipe leading to the muffler. The water manifold f is retained by bolts d and by displacing the former carefully the gaskets may be saved. The exhaust manifold h is secured by nuts, one of which is shown at g, and in loosening these slack off a little at a time on each. Place the nuts in

Digitized by Google

a small box and steady the manifold when removing it. It may stick a little but if care is observed it can be removed without accident or without

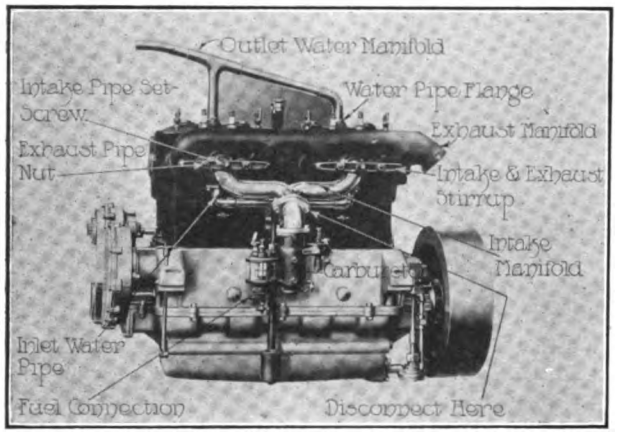

Fig. 3—Exterior Components of Motor, Also Illustrating Method of Retaining Intake and Exhaust Manifolds.

the danger of spoiling the gaskets.

The intake manifold l is similarly retained but before loosening the nuts take out the bolts k, being careful not to exert undue strain upon the pipe, and remove the carburetor. The manifold may now be displaced in the same manner as was the exhaust. The inlet water manifold m is now accessible and as it is retained by four bolts these can be taken out easily. To prevent injury to the fan o and to reach the timing gears this and the belt p are displaced by taking out the bolts n. The starting crank s having its bearing in the housing r the bolts of the latter will have to be removed before the lower crankcase x can be separated from the upper member. By disconnecting the unions t and z the motor is ready for the removal of the cylinders and lower crankcase.

With the power plant either in the frame or on the stand, it is a simple matter to get at the nuts retaining the cylinders. Before taking off the latter make sure they are numbered. If not take a prick punch and mark them 1, 2, 3, 4, if single units, starting from the radiator. If cast in pairs or triplets but two marks will be necessary. The cylinders may be removed without disturbing the connecting rods and pistons or the crankcase may be taken off and the connecting rod caps displaced to permit of the rod and piston remaining in the cylinder. If the first named method is utilized have someone steady the rods and pistons while the cylinder is being lifted off. With the cylinders off the crankcase can be turned over on the stand and the lower half of the case removed for an inspection of the bearings as will be noted in sketch, Fig. 5.

If the cylinders have been taken off with the pistons, take out the latter and rods and place them so they will not become mixed, or better still prick punch them if not already marked. The cleaning of the cylinders of carbon should be thorough and care must be exercised not to scratch the metal. The heads of the pistons will also require cleaning and if the rings are carbonized remove them by slipping them over thin strips of metal inserted between them and the piston. Begin with the top ring and replace in the opposite order. After displacing all deposits from the cylinders, pistons and rings, compress the valve springs, take out retaining pin and place the springs in order on the bench. The valves need cleaning before grinding, which operation requires care and sometimes considerable patience. Any good grinding paste may be utilized, although the writer prefers the finest of carborundum mixed with oil. While complete instructions could be given for this work the writer holds that it is best for the novice to undertake the grinding under the supervision of some one familiar with the operation, a fellow motorist for example.. The screw driver method is the best for the beginner. It is rotated, and the valve lifted and turned from time to time, to secure a good seat. Care should be taken not to use too much abrasive or to exert too much pressure on the tool.

It is important that the valves be replaced in order, and if the heads are not numbered they

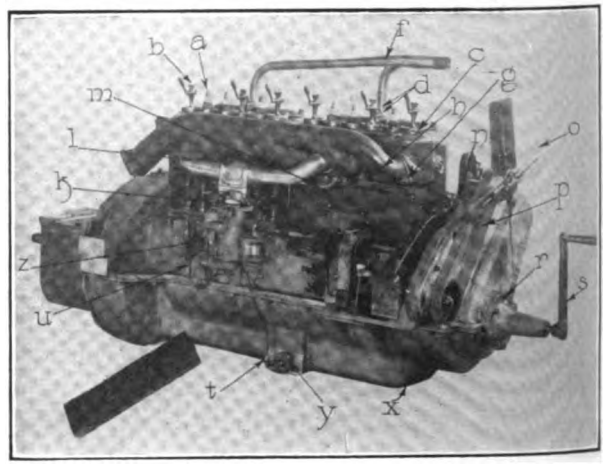

Fig. 4—Showing Proper Steps, Alphabetically Arranged, in Dismantling the Motor—To Reassemble, Reverse Order of Letters.

may be marked with the prick punch to prevent mistakes. The seats, valves and cylinder should be carefully washed with gasoline to remove all

Digitized by Google

traces of the abrasive and none should be allowed to get into the cylinder proper. This may be avoided by using waste in the ports leading to

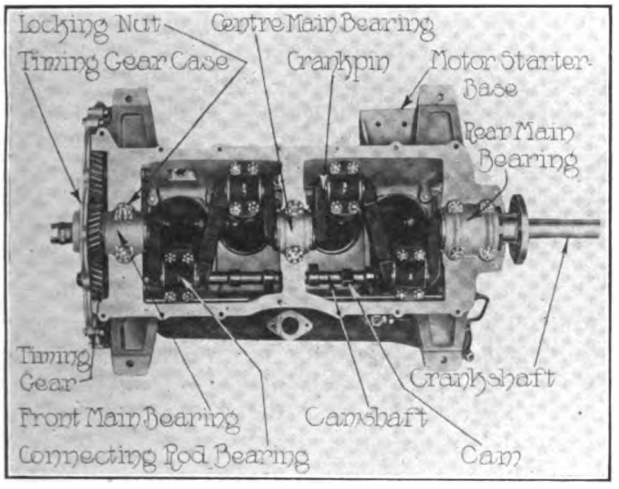

Fig. 5—Bottom View of Crankcase, Showing Conventional Type of Bearings, Etc.

the combustion chamber. Next clean the cylinders and replace valves, springs, etc.

If the pistons have been removed, clean these and replace in the cylinders, taking care to note that the openings of the rings are equally spaced, and use plenty of lubricant. Make sure with the hinge type connecting rod that the bolt end is on the proper side, else a mysterious knock may follow. The wristpins and the small end bearings of the connecting rod should be tested and any existing lost motion eliminated.

When the overhaul does not include the removal of the connecting rods and pistons from the case, they must be handled carefully and care taken not to rotate the crankshaft with the cylinders off. The replacement of the latter will trouble the novice and the work will require two, especially if the cylinders are multiple. The best method is for one to stand on the frame and steady the cylinder while the other person compresses the top ring. A clamp may be made of sheet metal or the ring held in place by winding with stout string. As the piston rings are very fragile the work must be accomplished slowly and carefully.

Before bolting the cylinders to the crankcase be sure to line them up. By this is meant that the intake and exhaust port sides must align, and this may be ascertained by using a straight edge. With the cylinders secured in place the connecting rods are next tested for play. Some side movement is permissible, but vertical play must be eliminated. One method of testing is to place a heavy screw driver between the rod and crank arm and use the tool as a lever. If the rod moves easily or can be slipped back and forth by hand, it is too loose. Remove connecting rod bolts and take out a shim, replace and lock snugly and try the bearing. The taking up of bearings is acquired by experience and it is recommended that the novice have his work inspected. Different types of bearings are adjusted more or less snugly. And it may be possible that they may need scraping. Unless familiar with the operation it is best to have the co-operation of some experienced person. When the motor has been placed on the stand the work of testing, scraping and adjusting bearings is simplified and more accurate. This is usually done in a thorough overhaul.

With the bearings adjusted and well lubricated, and each nut locked by a cotter pin, the various parts which were removed from the motor are cleaned before the work of assembling is begun. Prepare a paste of graphite and oil and smear the threads of all nuts, bolts, spark plugs, valve caps, etc., with the mixture.

The assembly may be accomplished by utilizing the alphabetical chart at Fig. 4, reversing the order by beginning with the oiler connections y, t and z. These members should be cleaned and inspected and the lower crankcase thoroughly washed before replacing. In connection with the lubricating system it should be mentioned that it is important to clean all pipes, tubes,

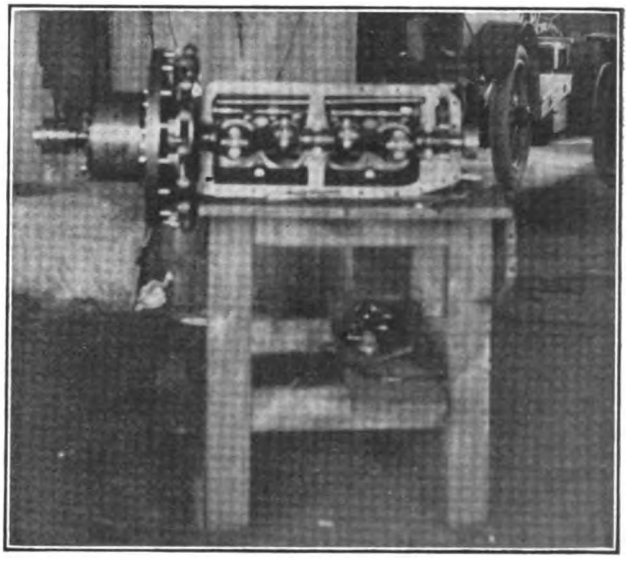

Fig. 6—Showing Motor on Stand Ready for Inspection.

screens, gauges, etc., and if the pressure of the exhaust be utilized, remove all carbon and examine the check valves.

Digitized by Google

The fitting of the gaskets employed between the intake and exhaust manifolds must be done carefully. If the gaskets are deteriorated procure new as auxiliary air must be eliminated from the intake connections, while a loose fitting exhaust pipe will be productive of hissing noises. Tighten each nut gradually and make sure that the manifolds are aligned, else undue strain will ensue and may result in a broken flange, etc.

Before replacing the valve caps check up the timing, that is, the opening and closing of each valve. An arrow or indicator is generally provided for this purpose. If not, make a prick punch in the centre of the last cylinder. The marks on the flywheel are utilized for timing and these are denoted by letters and figures, which may be as follows:

E O, exhaust valve opens.
E C, exhaust valve closes.
I O, intake valve opens.
I C, intake valve closes.
1, 2, 3 or 4, number of valve.
C, centre.

To check the timing rotate the flywheel until the mark I O 1 2, for example, coincides with the arrow and the intake valve of the first cylinder begins to lift. It may be late or early, which can be determined by rocking the flywheel back and forth. If out of time, loosen the check or locking nut and screw the tappet in or out until the valve starts to lift with the mark opposite the arrow. If correct, lock the nut and turn the flywheel until the I O appears. Next check the exhaust of the first cylinder and so on until each is correct. If the flywheel is marked in degrees the instruction book may be consulted, but the method is similar to the plan outlined.

It is an excellent plan to clean the carburetor before replacing it and in performing this work care should be exercised not to disturb the adjustments unless one is familiar with its setting. The gasket between it and the intake pipe must be in good condition and the connection tight. Before connecting the fuel pipe, allow a little gasoline to flow.

Next refill the crankcase and oiler with lubricant and spin the motor a few minutes to splash the oil to all working parts. Replace valve caps, spark plugs and priming cocks, taking care that these are set up tightly. After going over the power plant and trying all nuts, the ignition wires may be connected and tested. If the system includes a timer or distributor, these should be cleaned, or if worn, adjusted or repaired. As the wires were tagged or numbered, no difficulty ought to be experienced in replacing them correctly. However, a suggestion as to wiring the magneto will be of value in the event it has been removed or in case of trouble.

Assuming that the magneto has been removed: Place it on its base and turn the motor until the piston of the first cylinder is at the top of the compression stroke. Remove the distributor cap or housing and rotate the armature of the magneto until the arm or brush is in contact with either the extreme right or left hand segment, depending on the direction of rotation. It should be borne in mind that the distributor arm revolves in the opposite direction from that of the armature.

With the arm touching the No. 1 segment and the motor firing 1, 3, 4, 2, for example, the high-tension wire from this terminal is connected to the spark plug of the first cylinder. Next to fire is the third cylinder and the second contact to be made by the arm is connected by cable to the spark plug of the No. 3 cylinder. The fourth cylinder explodes third and its plug is connected to the third contact made by the arm. The remaining cylinder will be the second and firing last it is wired to the remaining contact of the distributor. If the novice will remember that the firing order of the cylinders must be observed on the distributor he will not experience trouble. Directions for connecting the primary leads, etc., of a magneto and battery system cannot be given because of the variance existing, but by studying the wiring plan in the instruction book the proper connections should be made easily. The different magneto systems have been discussed from time to time in The Automobile Journal.

As the muffler is a component of the power plant it should be cleaned thoroughly before starting up the motor, and if it is disassembled, smear all nuts and bolts with graphite before replacing these members. Next refill the radiator and note if any leaks exist; if so, these will require attention. If the bearings have been set up snugly, it will be a good plan to prime the motor.

Be sure that there is plenty of oil in the crankcase and if the system is of the non-circulating type, feed more lubricant until the bearings are run in. Run the motor slowly for a few minutes, listening carefully to catch any strange noise or any slight knock. If these exist, investigate and correct the trouble. If the engine runs sweetly it may be operated 15 minutes or more at a time to work in the bearings nicely before taking it out on the road for tuning up.

Ed. Note—The next article will deal with the overhaul of the clutch, transmission, rear axle and other components of the chassis.

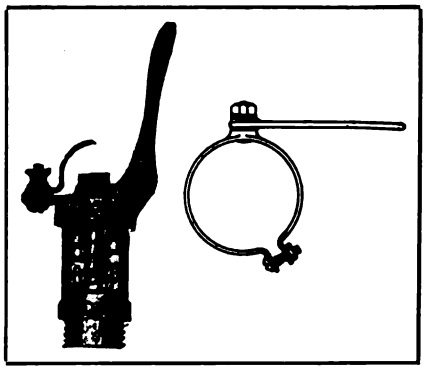
TRUCK OWNERS OBJECT.

Rhode Island and Massachusetts Legislators Seek to Impose Heavy Tax.

Motor truck owners in Rhode Island and Massachusetts have been brought face to face with a decidedly new problem. Without going to the trouble of holding a hearing the senate in the former state amended the motoring law so as to impose a license fee of $20 for commercial vehicles of one ton capacity and $10 for each additional ton. The present rate is $2 for each car of this type. When the matter came before the house it was referred back to the committee, and motor truck owners and users immediately formed an association to fight the bill. A hearing was accorded the measure April 22, at which members of this association explained that the fees proposed were sufficient to discourage all use of the mechanical transport. It is understood that the framers of the bill hold that commercial vehicles do much toward destroying the state roads, but it was brought out at the hearing that very few of these machines operated outside the cities.

In Massachusetts, the committee on roads and bridges reported a bill imposing a fee of $5 a ton, the present rate being $5 flat for all commercial vehicles. At once the Boston Commercial Motor Vehicle Association and the Electric Vehicle Club of that city, which have been busy throughout the session in opposing the bill to limit the size and weight of trucks, using the highways, called a meeting of motor truck users and owners and steps were taken to defeat the measure.

The commercial vehicle committee of the National Association of Automobile Manufacturers is aiding the organizations in both states.



M&M FUEL ECONOMIZER.

Device Making for Uniform Mixture by Supplying Additional Air When Required.

The value of additional air in carburetion is demonstrated by the general adoption of an auxiliary air intake to provide for a uniform mixture which is essential for speed and power. If the fuel is not sufficiently vaporized, either at low or high ratios, the mixture is rich and the operation of the motor is affected, to say nothing of the waste of fuel.

The principle involved with the M&M economizer is that of supplying additional air through the intake pipe or manifold above carburetor breaking up the globules of gasoline and converting them into a uniform mixture. This is accomplished by its construction, which comprises a single valve with a ground seat and six port holes, and including means for cutting out the mixture and ignition when descending grades, slowing up for corners or crossings. It is adaptable to all types of motors and systems of ignition, and may be termed a carburetor adjuster in that the operator of the vehicle can secure more speed and power with the same throttle opening by admitting air into the intake pipe.

In addition to saving a large percentage of the fuel it serves as an efficient brake in that a simple movement of the steering wheel or pedal control cuts off the supply of gas and ignition, and with the clutch in, the motor acts as a brake. The engine consequently draws in pure air, cooling the cylinders. The motor is restarted easily by the control member, as the ignition is cut in and the mixture is supplied automatically by the economizer.

M&M Economizer and Steering Wheel Control.

The ignition control is by a special spring, which may be set to conform to any system of ignition. The economizer is installed easily, the work involving only the drilling and tapping of a hole in the intake pipe. The control member may be located on the steering wheel or operated by a friction pedal. With the latter method the economizer will remain in the position in which it is set until changed. It may also be utilized as a cut-out or an accelerator, operating in the same manner as the carburetor throttle.

The M&M is also made for motorcycles and is constructed of high grade material, nickel plated and highly polished. It is manufactured by the Moller Bros. Controller & Economizer Company with main offices at 700 Betz building, Philadelphia, and is fully guaranteed.

It is understood that the Motor and Accessory Manufacturers will soon take steps in opposition to the new tariff schedule on tires, and that several of the tire makers in Trenton, N. J., and vicinity are organizing for this purpose.

GENERAL NEWS OF THE INDUSTRY.

Model Gas Engine Works to Locate Additional Plant in Pittsburg—New Concern Organized to Produce Cars and Trucks—Changes in Personnel, Etc.

THE Model Gas Engine Works, Peru, Ind., maker of gasoline engines, for automobiles, tractor engines, clutches and transmissions, has purchased four acres of land fronting on the railroads at Pittsburg, Penn., and a factory will be built to cost $200,000, to be in operation Sept. 1. The Peru plant will be operated as formerly and there will be little change in the company's organization except that men of considerable wealth will be added to the directorate. It is announced that $500,000 in cash, in addition to the present capital, is being put into the business, thus making the total capitalization $750,000.

The Peru concern is of long standing and having outgrown capacity, labor supply and railroad facilities at Peru, decided to establish the second plant at Pittsburg. A noiseless, dirtless, electrically driven plant of light brick and pleasing architectural design will be erected and 500 skilled workmen will be employed. Within three or four years extensions that will aggregate $500,000 will be made and the number of employees will be doubled. The new company will be incorporated under the laws of Pennsylvania, the name being the Pittsburg Model Engine Company.

MOTOKART COMPANY FORMED.

A. R. Gormully Heads Concern Engaged in Producing Parcel Delivery Wagons.

Papers have been filed at Albany, N. Y., covering the incorporation of the Motokart Company, a $250,000 concern organized for the purpose of building light commercial automobiles. The new company will be headed by A. R. Gormully, recently of the United States Motor Company, as president. Wallace Odell of Tarrytown, N. Y., a new comer in the industry, is named as vice president and treasurer, and B. J. Knerr, auditor of the United States Motor Company, is secretary.

The company will start with stock subscriptions of $50,000. It has secured under a three years' lease a shop at Tarrytown, which has over 30,000 square feet of floor space and general offices have been established in the United States Rubber building at 1790 Broadway, New York City. It is the company's expressed intention to confine itself to the manufacture of parcel delivery wagons, the first model being a small four-wheel vehicle. Further particulars will be given in an official statement which will be made public at a later date.

TO PRODUCE MOTOR TRUCK.

Los Angeles Concern Organized to Manufacture Worm Driven Vehicle of New Design.

The Los Angeles Motor Truck Manufacturing Company, Los Angeles, Cal., has been formed to build a new type of motor truck, with underslung chassis, with a low centre of gravity and loading platform 21 inches above the ground, but having 11 inches road clearance. The concern has purchased a 30-acre tract of land at Bangle Station, near Wilmington, Cal., at Los Angeles harbor. Plans are being drawn for five large, reinforced concrete buildings, which will cost, together with machinery, materials, etc., over $300,000. About 250 men will be employed at the plant.

W. B. Joslyn, E. E., A. E., who has been connected with the automobile industry practically from its inception, and who for several years was in charge of the experimental department of the Studebaker Corporation, Detroit, maker of Studebaker pleasure and commercial cars, is vice president and general manager of the company. Mr. Joslyn and M. S. Walton, M. E., A. E., a designer of many years' experience, have worked out the new type of truck. The drive is by worm with all parts housed and protected so as to be dirt and dust proof.

PULLMAN BUYS FACTORY SITE.

All Question of Possible Removal Now Eliminated and Work of Expansion Planned.

The Pullman Motor Car Company, York, Penn., has purchased the complete land and properties on which its plant is located, together with the three adjoining buildings. The addition of the latter gives ample scope to further the company's expansion policy and plans are now being perfected for the rearrangement of many

Digitized by Google

departments which will facilitate the manufacture of Pullman cars and expedite their prompt delivery.

The Pullman company by this purchase makes itself absolutely independent and eliminates the possibility of future removal because of property conditions over which it would have no control. The various departments are being expanded and brought to the highest point of efficiency. Improvements started several months ago are now rapidly being completed.

VAUGHN CAR REDESIGNED.

New Company Organized in Kingston, N. Y., to Produce Six-Cylinder Machine.

A new company has been formed to build the Vaughn car at Kingston, N. Y. It has been incorporated for $1,350,000 and numbers among its officers some well known men of the automobile industry. The Vaughn has been newly designed and will be brought out as a six-cylinder machine.

The following are the officers of the concern: President, A. B. Cordner, formerly manager of the General Motors Truck Company, New York branch; general manager, F. E. Moscovics of the Remy Electric Company; secretary-treasurer, Harry W. Jones, formerly connected with the E-M-F organization.

TO INTEREST FRENCH CAPITAL.

Herrington Resigns as President of Wheel Company to Visit European Makers.

L. Herrington of Chicago, inventor of the automobile wheel which is being manufactured by the Fort Wayne Universal Wheel Company, Fort Wayne, Ind., has resigned the presidency of that concern after being re-elected to that office three months ago. He plans to visit France for the purpose of demonstrating his invention before a number of capitalists in that country with a view to organizing a $1,000,000 company which will manufacture the wheel for the automobile trade in Europe. After spending some little time in France he will go to Germany and England on a similar mission.

New officers were elected at a recent meeting of stockholders as follows: President, J. W. Wisehart; vice president and treasurer, L. H. Moore; secretary, J. C. Thornburgh; superintendent, W. F. Davis; assistant secretary, H. P. Moses; attorney, E. G. Hoffman; directors, J. W. Wisehart, L. H. Moore, J. C. Thornburgh, H. P. Moses, W. F. Davis, E. F. Davis, E. G. Hoffman, Edwin Irle and Dr. G. A. Leach.

STROUT WITH HAYNES COMPANY.

New Sales Concern Established to Handle Cars of This Make in Middle West.

George H. Strout, for the past year district sales manager for the Cole Motor Car Company, Indianapolis, Ind., maker of Cole cars, has been appointed general sales manager of the Haynes Automobile Company, Kokomo, Ind., maker of the Haynes line. He succeeds Webb Jay, who with several others has organized the Haynes Motor Car Company, with headquarters in Chicago, to take over the sales of Haynes cars in the Middle West.

George H. Strout, Sales Manager, Haynes Automobile Company.

Mr. Strout is one of the best known men in the industry, and his change of plans came as a complete surprise, even to his associates with the Cole company, who join with his many friends and acquaintances in wishing him success in his new position. For a long time he was sales manager of the Apperson Bros. Automobile Company of Kokomo, maker of Apperson cars, and therefore will be entirely at home in that city. While with the Cole organization he did much to strengthen the sales force east of the Mississippi river.

The officers of the new Haynes sales company in Chicago are as follows: President, A. E. Starbuck; vice president, Webb Jay; secretary and treasurer, A. G. Seiberling. As a further evidence of the increased demand for machines of this make it may be added that the factory has been enlarged and will be rushed to its capacity to take care of the orders which are now rapidly coming in.

WITH CONTINENTAL MOTOR.

A. H. Doolittle Leaves Thompson Agency to Handle Advertising Campaign.

That the Continental Motor Manufacturing Company of Detroit and Muskegon, Mich., is to inaugurate an extensive selling campaign is borne out by the appointment of Albert H. Doolittle as advertising manager. Mr. Doolittle is well known in the industry, and goes to the Continental company from the staff of the J. Walter Thompson Advertising Agency of Detroit. It is understood that the Continental business will still be placed through the MacManus Company of Detroit and Toledo.

After studying mechanical engineering at Cornell University, Mr. Doolittle became a member of the engineering force of the Pope Manufacturing Company, Hartford, Conn., in 1904, for the experience that branch afforded. Less than a year later he entered the shops of the Electric Vehicle Company of that city for a thorough course in automobile building. Here he went through every department of mechanical construction, assembling, testing, repairing, demonstrating, contest driving and selling, becoming assistant manager of the New York branch.

A. H. Doolittle, Advertising Manager, Continental Motor Manufacturing Company.

In 1909, Mr. Doolittle made an extended motor tour of Europe, entering six countries and covering over 7000 miles. During this trip he crossed 17 of the highest passes in the Alps in an American car without trouble. He also visited a number of foreign factories and gained a good insight into their methods.

Upon his return he entered the employ of the Knox Automobile Company, Springfield, Mass., and in six months became advertising manager. His copy was conceded to be of a special value and his publicity stories were widely used. In this manner he was brought to the attention of the Journal Company of Troy, N. Y., where he aided in directing the advertising campaigns of various automobile concerns and became automobile editor of The Carriage Dealers' Journal. While engaged in special work for this company on behalf of a factory in Moline, Ill., he became associated with the Thompson agency.

IS PRODUCING TURNTABLES.

Michigan Concern Incorporates and Secures Enlarged Facilities for Manufacturing.

The T. C. Beach Auto Turntable Company, St. Johns, Mich., has incorporated with capital stock of $10,000 for the purpose of manufacturing automobile turntables. The incorporators and stockholders are: T. C. Beach, R. S. Clark, W. J. Moss and Robert H. Chapin, all of St. Johns.

The cement factory at the crossing of Lansing street and the Grand Trunk railway has been leased, a provision being included for the purchase of the building later if desired. The concern proposes to increase its scope and equipment as fast as the business warrants.

ERECTING NEW BUILDINGS.

Motor Foundry Company Increases Capital to Meet Demands of Enlarged Business.

Stockholders of the Motor Foundry Company, Detroit, at the annual meeting, gave approval to the plan for increasing the company's capital from $35,000 to $100,000 to provide funds for extensions of the plant necessitated by enlarged business. The additional capital has been fully paid in and work has begun on the erection of new buildings adjoining the present plant, which covers 2.5 acres on Hart avenue.

The company employs 265 men and has a melting capacity of 40 to 50 tons of iron a day. Completion of the additions will increase the capacity to 80 tons a day. The plant is one of the largest gray iron foundries in the country producing exclusively castings for gasoline motors.

The officers are: President and general manager, J. H. James; vice president, E. A. Nelson; secretary and treasurer, L. H. Green. The active management of the company is in the hands of Mr. James and Mr. Green, both young men of wide experience as foundrymen in iron, steel and malleable iron castings.

HERMES CAR IN CINCINNATI.

New Company Considering Offers from Many Cities as Location for Its Plant.

The Hermes Motor Car Company, with preliminary capital of $30,000, that shortly is to be increased to $300,000, is a new concern organized at Cincinnati, O., with its preliminary experimenting plant at 1625 Blue Rock street. Although the company is said to be desirous of locating permanently in Cincinnati, it is understood that offers from 15 cities are being considered.

A test motor car, which will be called the Hermes, has been completed by the company and it has been in operation in and around Cincinnati. The machine is equipped with Beaver motor, wire wheels, electric starting and lighting system, and has a 124-inch wheelbase. The promoters have not been named as yet, but will be announced when the company decides definitely upon its future plans.

AKRON STRIKE ENDED.

Goodyear Official Sets Forth Conditions at the Close of the Recent Trouble.

Earlier in the month, C. W. Seiberling, vice president of the Goodyear Tire & Rubber Company, Akron, O., announced the end of the recent strike of the employees of the rubber concerns in that city. Mr. Seiberling's communication follows:

When the I. W. W. rubber strike was formally declared off by the imported leaders at a meeting on Sunday, the last bar to prevent Akron industrial institutions from returning to normal was removed. Akron has passed through a time of considerable stress and indications are that there will be no further labor disturbance for a good many years to come. Workmen in the Akron rubber factories who were temporarily carried away by the Socialistic agitation of the Industrial Workers of the World appear to have returned to a sensible view of the situation, and we firmly believe that conditions in Akron will be better than ever before, though the workmen and the manufacturers themselves have experienced some loss by reason of suspended operations. It now seems certain that the result is for the better of all concerned, though absolutely no concessions were granted by employers to bring about Sunday's declaration that the strike is off.

Through the work in Akron of the state arbitration board and later of the special probe committee appointed by the state the world was permitted to know that the Akron rubber factories pay higher wages for equal ability and experience than any other industry in the country; that Akron factories are modern and working conditions as pleasant and satisfactory as it is possible to make them. In our factory we have many men making from $5 to $7 daily who never earned $2 a day in their lives before they came to the Goodyear plant. It is remarkable that in view of such conditions, the strike agitation could have prevailed so long as it did.

But the fact remains that it did prevail, because the agitators of the I. W. W. had noted that Akron was filled with contented, well paid workers, and might possibly be made a fruitful field for contributions to their cause. While at the height of the excitement fully 10,000 men were taken from their work because of the excitement, because they sympathized with others, or because of intimidation, when the final meeting was held there were less than 300 stubborn members left, and these voted overwhelmingly to declare the strike off.

Now that normal conditions have returned we feel that we shall have little, if any, difficulty in meeting all our orders promptly and in making the big increase in our business for the year that we predicted some months ago.

SELECTS CLEVELAND SITE.

Plans Completed for Location of Chandler Plant on New Belt Line Property.

Negotiations for the purchase of a site and the erection of factory buildings at Cleveland, O., have been concluded by the Chandler Motor Car Company, which will manufacture the Chandler car. The ground upon which the plant will be built consists of six acres and is the first to be located on the new Belt Line railway, a $20,000,000 line connecting with seven trunk railroads, as follows: Lake Shore, Nickel Plate, Big Four, Erie, B. & O., Wheeling & Lake Erie and Pennsylvania.

This gives unexcelled shipping facilities. Plans for the factory have been drawn and bids for construction are now being received. Adjacent to the site is a large section occupied by the homes of working people and street car and transportation facilities are splendid. It is contemplated that the plant will be complete and ready for occupancy early in June and will be in full operation by July 1.

TO LOCATE IN NASHVILLE.

Evans Motor Car Company Will Succeed Detroit Concern in New Surroundings.

The Evans Motor Car Company of Nashville has been chartered at Nashville, Tenn., with capital stock of $50,000, for the purpose of manufacturing commercial motor vehicles and the Evans gas engine. The incorporators are: Everett Philpot, George R. Anthony, Howell Brandon, Clarence Woodcock, A. P. Foster and R. H. Evans.

The concern will take over the business of the Automobile Manufacturing & Engineering Company of Detroit, in which Mr. Evans is interested. It is the intention of the company to locate the factory five miles from Nashville on the Gallatin pike. It is planned to manufacture

Digitized by Google

500 cars the first year, and later to increase the capital stock to $200,000. The plant eventually will employ 600 to 1000 men.

RECEIVER MAKES REPORT.

Financial Condition of Flanders Manufacturing Company of Pontiac, Mich.

Ralph Stone, vice president of the Detroit Trust Company, Detroit, has made report to the stockholders and creditors of the Flanders Manufacturing Company, Pontiac, Mich., for which his company is receiver. This sets forth the condition of the property, and indicates cash on hand amounting to $230,000; cash paid preferred claims, $16,700, making a total of $246,700 thus far realized for creditors. Application will be made to the court for permission to distribute this to creditors whose claims have been proved and allowed. The report also sets forth the following:

At Pontiac, Mich., are the following departments:

1—Electric automobile department, which we continued to operate, completing in all 39, which were all that could be profitably made without the purchase of a large amount of expensive parts. These we readily sold for cash at very little under the average prices received by the company in the past.

2—Gear and transmission department, which was producing rear axles and differential gears complete for the Flanders Motor Company. This work was continued to Feb. 1, at which time it was thought desirable from a receiver's standpoint of view to discontinue it.

3—Foundry department, was operating on a small scale. The unfilled orders on hand in this department amount to $29,000, some of which we filled and then shut down because it was not deemed profitable to operate unless the output was somewhere near its maximum capacity. The orders on hand and prospect for work in view of the receivership made it impracticable for these reasons to continue this department.

4—Drop forge department, was operating on a small scale. The unfilled orders on hand in this department amounted to $15,000, some of which we filled and then shut down because it was not deemed profitable to operate unless the output was somewhere near its maximum capacity. The orders on hand and prospect for work in view of the receivership made it impracticable for these reasons to continue this department.

At Chelsea, Mich., are the following departments:

1—Ball bearing department, which we continued to operate until March 1, when the same, including all materials, stock and supplies, was sold.

2—Motorcycle department. There were 142 nearly completed machines of the 1912 style on hand which we sold. The company had under way the manufacturing of 500 single-cylinder machines for 1913, and were also working upon the tools, patterns, etc., for a twin-cylinder machine, the drawings for which had been made and approved, all of which work we discontinued owing to the fact that so little had been done on both the single and twin-cylinder machines that it was impractical, from the receiver's standpoint, to continue their manufacture.

3—Screw machine department. This department we operated for a short time to complete unfilled orders on hand. In this department there were operated several automatic screw machines which the company had manufactured, as it contemplated not only operating automatic screw machines, but the manufacture and sale of some designed and built by it. It perfected one machine and secured letters patent for same in several foreign countries, and had some time prior to our appointment endeavored to dispose of the patent rights, without success.

4—Spraying machine department. This department was not operating for some time prior to our appointment.

The receiver states that some time after the appointment it was advised that the largest stockholders would not be interested in any plans for reorganization. Application will be made for the sale of the property in such parcels as will best suit the purchaser. The table shows the inventory and appraisal as of Dec. 6, 1912.

NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS.

Hotakold Bottle.

The Hotakold bottle is produced by the Vacuum Specialty Company, First avenue and 36th street, New York City, and as the name implies is utilized to maintain liquids in a hot or cold condition, this depending upon their temperatures when poured into the vessel. It is claimed by the maker that cold liquids will retain their temperature for three days. The bottle is designed to withstand the hard service in motor cars, as the glass section is flexibly supported in the metal case. Hotakold comes in pint and quart sizes, with cork or ground glass stopper and is finished in nickel or leather in colors.

Simplex Valve Lifter.

F. A. Baker & Co., 10 Warren street, New York City, is marketing the Simplex valve lifter, designed especially for motorcycle engines. It is constructed in such manner that it can be stored conveniently in the tool kit. It is adjustable to differing types of motors and is easily operated, the moving of the handle member compressing the valve spring sufficiently to permit of displacing the retaining pin. The valve lifter is constructed of high grade material and is inexpensive.

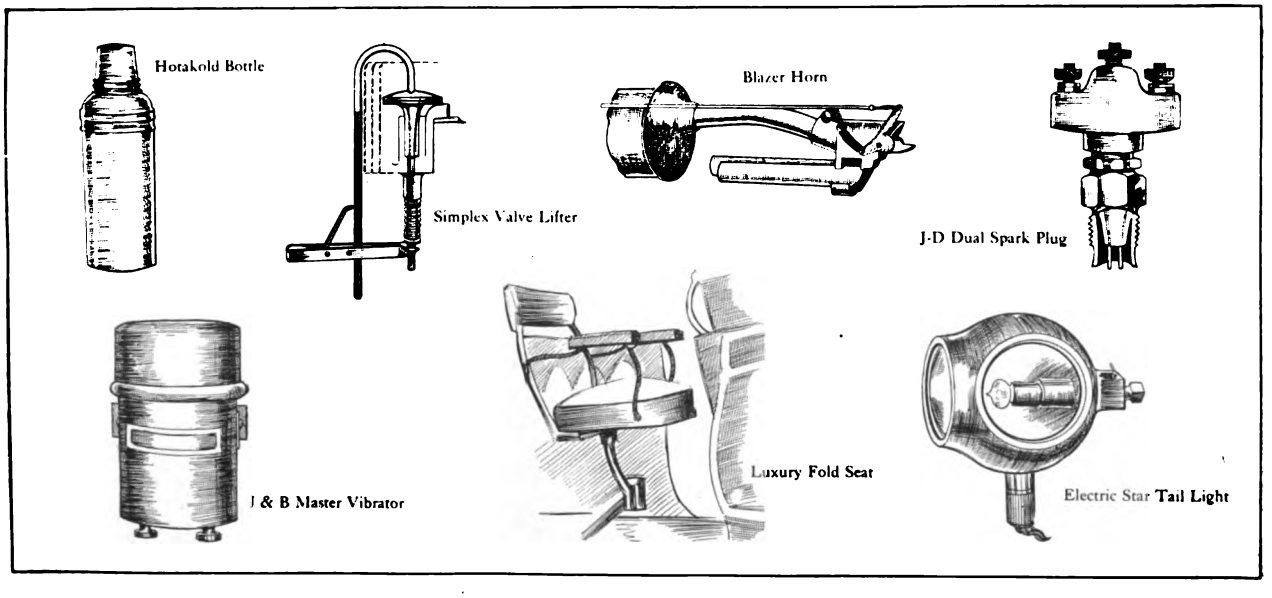
Blazer Horn.

The Blazer horn is manufactured by the Motor Specialties Company, Waltham, Mass., and is designed for Ford automobiles. It is operated by the exhaust gases and the maker states that it requires but little pressure to produce a penetrating, musical signal. The horn is attached to the exhaust pipe of the muffler, being slipped over readily and being locked by a clamp and set screw. This construction makes for easy installation and without any alteration. The horn extends toward the front of the car and is actuated by the gases, which are deflected by a simple valve arrangement operated by the usual cable and pedal. Normally the valve is held open by a spring and it does not interfere with their expansion. The Blazer horn is constructed of high grade material, is guaranteed and is moderately priced.

J-D Dual Spark Plug.

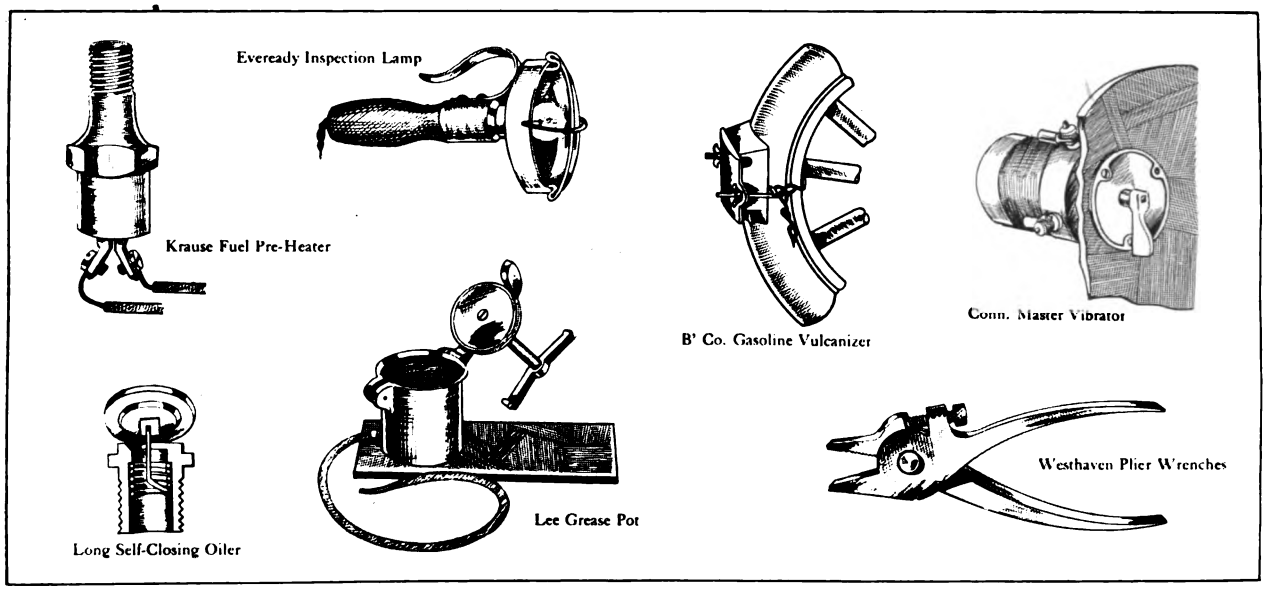
The Jeffery-Dewitt Company, Detroit, has brought out a new type of spark plug, which provides for true dual ignition where provision has only been made for one plug in the cylinder. The double system plug as it is termed, is practically two plugs in one, and having two separate and distinct circuits, permits of the use of a magneto on one side and batteries on the other, or two sets of batteries if desired. Each spark gap is independent of the other and the plug may be arranged to work in series with another plug in the same cylinder, thus producing two simultaneous sparks. A standard porcelain plug for motorcycles has also been introduced. In all plugs is featured a new alloy packing, having the same expansion and contraction as porcelain, and it is stated that leakage is prevented by the material.

J & B Junior Master Vibrator.



The J & B Manufacturing Company, Pittsfield, Mass., has added to its line of specialties by announcing the J & B junior master vibrator, to meet the demand for a popular priced instrument and one having the same high grade material and workmanship that mark the products of this concern. The new vibrator is very compact, being 3.5 inches long and but 2.625 in diameter. It may be located on the dash or inside the hood as desired, and floats on the line, dispensing with the usual coil box and switch. The control is by the conventional switch on the regular coil. The new instrument is water, oil and heat proof and comes complete with necessary cable cut to the proper length, soldered terminals, screws, fittings, etc. It is particularly adapted for Ford automobiles but may be employed with multi-cylinder units where synchronization of the spark is desired.

Electric Star Tail Light.



The Milwaukee Bronze Casting Company, 119 Clinton street, Milwaukee, Wis., is manufacturing two designs of Electric Star tail lights, known as types L and M. The latter is designed for fitting any standard rear lamp bracket, round or flat, and is five inches in diameter. Type L is built with bracket integral with the lamp and the wires are contained and consequently are not exposed to the weather. Both types are made with two and three lenses respectively, and these are three inches in diameter. In addition to the usual red semaphore and white light, two styles have a colored semaphore. The lights are made without screws, rivets or solder, being practically a solid construction, and are dust and weather proof. High grade material and workmanship are noticeable of the designs.

Luxury Folding Seats.

The space in the tonneau of a number of automobiles is such as to permit of the installation of extra seats, thus converting a five-passenger car into a seven, for instance. The Hodge & Graves Company, Amesbury, Mass., is manufacturing the patent Luxury folding seats and these are made in four styles, A, B, C and D, respectively. They are made of the highest quality of drop forgings and well finished in the best grade of leather in colors to match that of the machine. The seat and back are padded with the finest of curled hair. A feature is the retaining device, comprising a dove-tailed socket iron, which is secured to the side of the car and is covered by the upholstery. Replacing the usual brace or knee it not only eliminates bulkiness, but makes for convenience

Digitized by Google

when the seats are not in service. The seat arm is tapered and fits within a socket in the body iron, a design making for easy removal. When not in use the seats fold back into a very small space when left in the tonneau. They revolve on their brackets, so that the user can face in any desired direction. The Luxury folding seats may be adjusted to any desired height if necessary by bending the supporting arms in a vise and by the use of a wrench. Styles A, B and C are made in three sizes, having 10, 12 and 14-inch bottoms, while style D is made with 14 and 16-inch bottoms. The different grains and colors of leather of the machine are matched by forwarding a sample to the company, which will supply detailed information on request.

Krause Fuel Pre-Heater.

The Krause Manufacturing Company, 654 Franklin street, Detroit, has brought out the Krause gasoline pre-heater, a device operated by electricity and designed for warming the fuel in the carburetor. It replaces the used drain cock, being screwed into the bowl of the carburetor. Two terminals are provided for attaching leads from the battery and the usual switch member is incorporated. Closing the circuit allows current to flow to the pre-heater, warming the fuel and assisting in its vaporization. The device is operated by any six-volt battery.

Eveready Inspection Lamp.

Although provision is made for the utilization of an electric inspection or trouble lamp with the lighting system of the automobile, there are cars not thus equipped. The American Ever Ready Company, 322 Hudson street, New York City, is marketing what is termed the Eveready safety inspection lamp, which is very compact and is made in two styles. One may be operated by three dry cells and the other by five, the voltage of the lamps being four and six respectively. The lamp is equipped with a hook and the bulb is fully protected. A suitable length of flexible cord and terminals are included.

Connecticut Master Vibrator.

The Connecticut Telephone & Electric Company, Meriden, Conn., maker of ignition specialties, is producing a combined master vibrator and switch for model T Ford automobiles that differs from usual construction in that it is mounted on the dash inside the hood with a flush switch member very compact and accessible. All wires and connections are concealed, making for a clean dash. Although the vibrator may be adjusted, being accessible, the company points out that it will not require attention other than once a season and only after considerable service. The same high grade material and workmanship noticeable of the product of the company are incorporated.

B' Co. Gasoline Vulcanizer.

The Brown Company, Syracuse, N. Y., is producing the B' Co. vulcanizer, which is moderately priced, utilizes gasoline and is adapted for repairing both inner tubes and casings. When a shoe is to be vulcanized the vulcanizer is retained in place by passing a chain around the felloe and securing the holder to the clamps. The device is provided with a long concave surface, permitting of the repair of cuts, etc., near the bead of the tire, and is constructed in three parts, body, cover and measuring cup. When employed in an upright position the measuring cup is utilized to retain the gasoline. The cover fits the convex surface and is used when tubes are to be mended. The vulcanizer is finished in nickel, weighs but three pounds and is very compact.

Long Self-Closing Oiler.

Long Bros., Kokomo, Ind., maker of oiling devices, is marketing self-closing oilers known as style S. The construction is simple, the cover being opened easily when lubricant is to be inserted, and the design is such that dust and foreign elements are excluded. The spring actuating the cover is of music wire and does not interfere with the replenishing of the lubricant. Hexagon heads are incorporated for installation and the threads are standard, ranging from .3125 to .5 inch.

Lee Grease Pot.

A grease pot for refilling differentials, transmissions, etc., has been designed by H. B. Lee of New London, Conn. Its body is seven by seven inches of cast iron and the plunger six inches in diameter. The latter with the screw and handle is retained by a crossbar, hinged to the pot at both ends, although either side may be removed. The pot is mounted on a board, eight by 20 inches and when filled with grease the plunger member is closed down and the screw turned. This forces the lubricant through a flexible metal tube to the part to be filled. The Lee grease pot is made in two styles, one for light grease and oil, and the other for heavy grease.

Westhaven Plier Wrenches.

The Westhaven patent plier and adjustable wrench is produced by the West Haven Manufacturing Company, New Haven, Conn., and among the features of the tool is its adaptability for several kinds of work. The design differs from conventional types in that a set screw is incorporated in one of its arms and that the jaws may be adjusted to the size of the work by means of the screw member. When utilized as a wrench the stresses are cared for by the screw and arm, energy being applied to the latter as with an ordinary tool. It is easily and quickly converted into pliers by turning back the set screw. Part of one jaw has teeth milled crosswise, while the opposite member is smooth, with the exception of a groove milled lengthwise for holding wire. A wire cutter also is incorporated. The tool is specially adapted for work not easily accessible with ordinary members and may be employed as a ratchet member, as it is stated that it will grasp round work instantly. It is sturdily

Digitized by Google

constructed, being a drop forging of tempered steel, and is made in two sizes, one 6.5 inches long and having a jaw opening of one inch, and the other 8.5 inches long with opening of 1.5. Different finishes are provided.

Mayo All-Steel Trucks.

The all-steel trucks produced by the Mayo Manufacturing Company, Chicago, are of the double wheel caster truss design, having long bearings and specially adapted to the garage or repair shop. The runway plates are self-elevating, are always clear of the floor and constitute a lock when depressed by the tire. But one model is made and it is held to be capable of carrying any size car. The trucks come in pairs, finished in black enamel.

Victor Exhaust and Intake Gaskets.

The Victor Manufacturing & Gasket Company, Troy and 21st streets, Chicago, is marketing a special gasket for intake and exhaust pipes. It is of the centre flange type, composed of asbestos and copper and is designed to be compressed between the manifold and cylinder in the conventional manner. Not only does the flange prevent entrance of auxiliary air, but the escape of the exhaust gases as well. They are made in different sizes and diameters.

J-M Fyro Extinguisher.

The H. W. Johns-Manville Company, Madison avenue and 41st street, New York City, has brought out a new chemical fire extinguisher of the one-quart type, known as the J-M Fyro. Because of its lightness and compactness it is specially adapted to be carried in the automobile or stored in the garage. It differs from the usual extinguisher in that compressed air is employed for discharging the extinguishing fluid. The latter is a liquid gas, five times as heavy as air, and on account of its weight quickly envelopes the flames, displacing the oxygen. When thrown on a fire it instantly volatilizes, forming a dense combustion and arresting gas in which flames cannot live. It is claimed that one quart of the J-M Fyro liquid will expand to 4000 cubic feet of fire annihilating gas and that one quart of ordinary extinguishing fluid will make only 1000 feet. It is held to be especially effective on naphtha, oil, varnish, calcium chloride and electrical fires, as well as gasoline. It is non-corrosive and will not injure metals, fabrics or furnishings. A feature of Fyro is that it does not deteriorate and is not affected by differing temperatures.

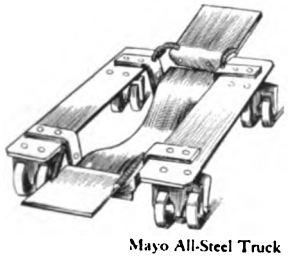
Lassco Rear Signalling Lamp.

The Lassco rear lamp and signalling device is manufactured by the Auto Safety Signal Lamp Company, 246 North street, Philadelphia. It is circular, about seven inches in diameter, and is divided into four sections, each of which contains a small tungsten bulb. These may be operated together or independently of each other and the control member is a four-button switch located on the steering column. The first section is the conventional red semaphore, another shows the letter R and the third the letter L, for right and left turns of the vehicle. The fourth section presents the word "Stop." The lower part of the lamp illuminates the license tag with a white light.

Weiss Filler Hole Gauge.

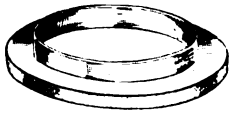
A filler hole gauge especially designed for motorcycles has been brought out by the Weiss Manufacturing Company, Torrington, Conn. It is fitted into the opening of the fuel tank, acting as a filler cap and gauge. The device is automatic in its action and is properly vented. The gauge is constructed to fit standard makes of motorcycles and comes nickel plated.

Moore Spark Plug Wrench.



J. C. Moore & Co., Racine, Wis., is manufacturing a spark plug wrench which comes in two parts, the wrench proper and a handle. The former is a double headed member, fitting .5-inch standard and .875-inch A. L. A. M. spark plugs. It is constructed of high grade material and by it plugs may be removed when an ordinary wrench could not be utilized.

Sparton Electric Horn.



The Sparks-Withington Company, Jackson, Mich., is making its Sparton electric horn in two models and each may be operated by any six or eight-volt battery, dry cells or a storage. A clear, penetrating signal is given by the Sparton, which comes complete with the usual length of flexible cord and push button. The horns are finished in polished brass, white nickel, black and nickel, black and brass, or all black.

Wolf Mixer.

The present grade of gasoline marketed offers difficulty in vaporization and with the carburetor so adjusted as to make easy starting, the mixture is apt to be too rich at higher motor speeds. This is due to the unvolatilized fuel in the form of small globules being carried from the vaporizer to the cylinders. Not only is the gasoline wasted, but the richness of the mixture tends to create soot in the motor. To obtain efficiency from the engine the mixture should be uniform at all speeds. The Approved Auto Specialties Company, 1731 Broadway, New York City, is marketing the Wolf mixer, which is inserted in the intake manifold between the carburetor and the cylinders, and which is designed to break up the globules of fuel. This is secured through the construction of the device, which is free from screens or clogging members. The raw fluid is broken up and converted into a mist and mingled with the air by a whirling motion, created by the design of the mixer. This results in the utilization of less fuel, making for economy as well as maximum efficiency. The Wolf mixer is easily installed, being inserted in the intake pipe and without fittings of any kind. It is retained in position by a flange and will endure for an indefinite period of time.

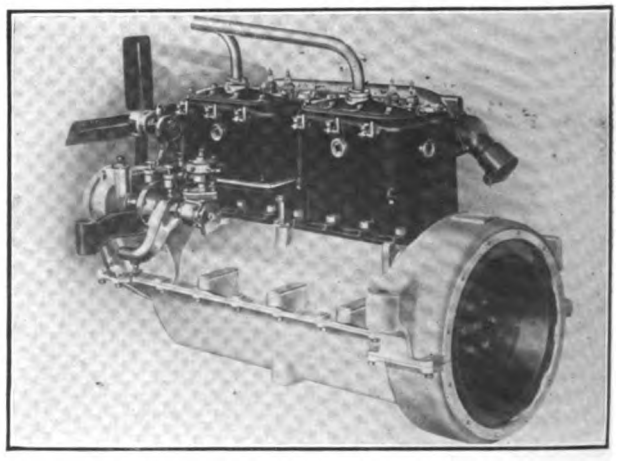
CONTINENTAL LINE AUGMENTED BY NEW SIX.

THE Continental Motor Manufacturing Company, Detroit, maker of the well known Continental motors, announces a new little six, termed the model P 6, which was designed to meet the increasing demand for a thoroughly high grade, light weight engine of normal horsepower. Following the custom of the company the new model was tested for over a year and complete preparations have been made for its production in large quantities.

A Silent Chain Is Utilized for Starting Purposes.

In keeping with the other types manufactured, the new motor is designed to be utilized independently or in the form of a complete or unit power plant with a multiple disc clutch and a three or four-speed selective transmission. Any type of magneto, ignition, dynamo or lighting device may be installed and the construction of the crankcase is such that any motor starter may be fitted easily. Provision is made for right or left hand drive, side or centre control.

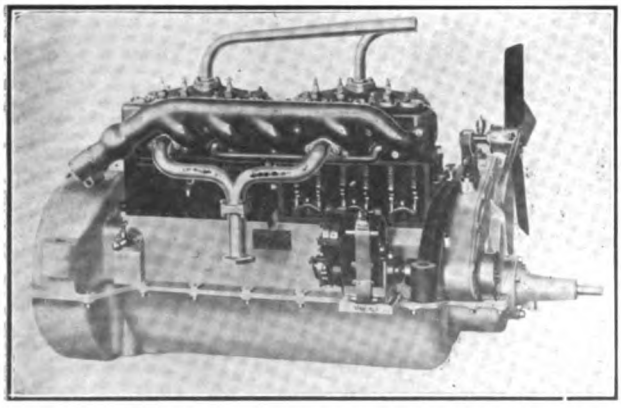


In connection with the motor starting feature it is interesting to note that a silent chain is employed this running in the timing gearcase and in a bath of lubricant, insuring durability as well as noiseless operation. It also serves to drive the pump and commutator and an electric generator when not utilized for starting purposes.

The bore is 3.75 inches and stroke 5.25, a bore to stroke ratio of 1:1.41, which places it in the long stroke class. Although the rating by the S. A. E. formula is 33.75 horsepower, it will develop 48 at 1500 revolutions a minute. The cylinders are of the vertical L head type cast in triplets and the design is very compact, the maker stating it may be installed under a 40-inch hood without crowding. The total weight with flywheel and regular equipment is but 600 pounds.

The crankshaft is two inches in diameter and its three bearings are as follows: Front, two by 3.25 inches; centre, two by three; rear, two by 3.875. The length of the connecting rods is 10.375 inches with bearings 1.875 by 2.25 inches. The piston length is five inches, wristpin bearing 1.21875 by 1.875 inches, and three rings .1875 inch wide are fitted. The diameter of the camshaft is 1.0625 inches and its three bearings are as follows: Front, 2.25 by 2.625 inches; centre, two by 1.875; rear, 1.125 by 2.125. All cams are integral and accessible. The flywheel has a face of 4.375 inches and diameter of 15. The crankshaft rear extension is made to meet requirements.

The valve mechanism is enclosed by two metal covers retained by simple wing nuts, easily removed, and the valves are located on the right. They have a diameter of 1.6875 inches with .3125-inch stems. Carburetion is by any 1.25-inch standard make.



The oiling system is held to be very efficient and is a combination force feed and splash of the constant level type. The lubricant is circulated by a gear pump with positive multiple feeds, which forces the oil directly to the three main bearings, whence it is returned to the reservoir in the lower part of the crankcase. The overflow of the front bearing falls into a pocket in the timing gearcase. As the sprocket on the crankshaft and the silent chain are partially submerged they carry the oil to the helical cut timing gears and bearings in the front of the case. A constant level of lubricant is maintained in the wells under the connecting rods by gear pumps, forcing oil in equal amounts and in proportion to speeds.

New Continental Little Six 48 Horsepower Motor, Designed for Left, Right or Centre Control, and Having a Three Point Suspension.

Digitized by Google

The cooling is by water, circulated by a large centrifugal pump located on the left hand side of the motor. The inlet water manifold is on the

Showing the Intake and Exhaust Side of New Continental Motor Having Enclosed Valves and Adapted to Motor Starter, Lighting Dynamo, Etc.

right, the cooled fluid entering the cylinders directly under the valves at points subjected to the greatest heat. The fan is mounted on a removable bracket and adjustment of the belt tension is by an eccentric.

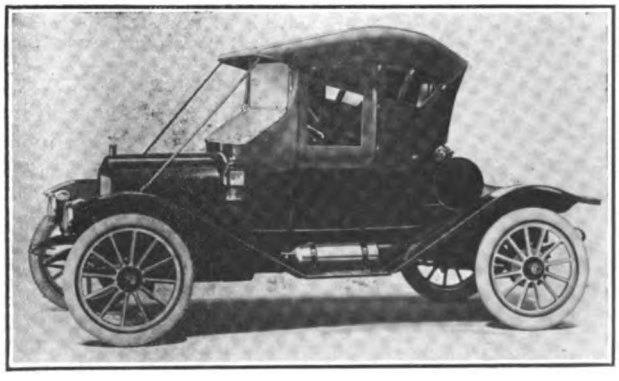
Both the intake and exhaust manifolds are located on the right and the former is of a simple Y shape, communicating with a gas passage cored inside of each block cylinder. The mounting of the motor is with three point suspension, thus avoiding opportunity for twisting strains on the crankcase. The pivot support in the front of the motor is fitted with a bronze bushing and the bearing is suitably lubricated. Any drop within reason from the supporting arms to the centre of the crankshaft can be supplied.

ENGINEERS TO INVESTIGATE.

Will Assist Committee Appointed by Manufacturers in Study of Fuel Problem.

Announcement is made that special arrangements are under way between the committee appointed some three months ago by the National Association of Automobile Manufacturers to study the fuel problem and the Society of Automobile Engineers, under which members of the latter organization will take up research work in connection with the subject of a substitute for gasoline. It is understood that the engineers' society will undertake the more technical side of the proposition, although no definite details of the plan have been made public.

Under its constitution the Society of Automobile Engineers is not permitted to engage in any remunerative enterprise, or to approve any commercial or engineering proposition. However, President Howard Marmon has lent his aid in the present instance, because he believes the development of improved methods of carburetion, particularly those applicable to heavier grades of fuel, is directly in line with the standardization work in which the society is engaged.



Special opportunity will be given inventors and others who are interested in the development of fuels to demonstrate their applicability to automobile propulsion. As the work progresses more definite announcement of its features will be made.

NOVELTY IN SIDE CURTAINS.

Studebaker Corporation Produces Type Designed to Swing with Door.

With the increased use of roadsters and runabouts by physicians, contractors and others, the Studebaker Corporation, Detroit, believes there has arisen a demand for some kind of storm protection which may be attached easily and which does not interfere in any manner with constant entrance and egress. An accompanying illustration shows the design recently presented by one of this company's engineers, as fitted to a 20 horsepower Studebaker roadster.

It will be noted that the side curtains in question are so fitted that they swing with the door of the car, thereby affording the required protection from the elements in summer or the cold of winter without changing any of the characteristics of the machine's standard equipment. This arrangement is expected to appeal very strongly

Studebaker Roadster with New Type of Side Curtain.

to the man who has frequent occasion to leave the car and who wishes to avoid the necessity for unbuttoning the curtain each time.

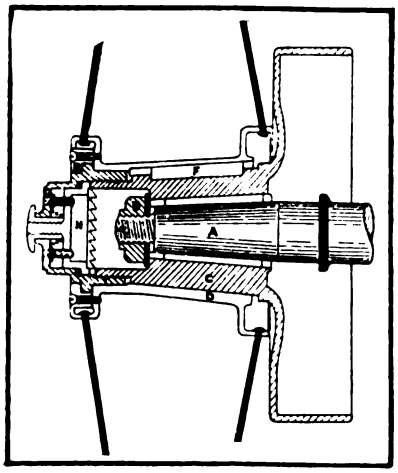
WITH THE MOTORING INTERESTS ABROAD.

Constructional Details of Italian S. C. A. T. as Fitted for British Market---Possibilities for American Automobile Business Abroad---Other Foreign News.

A FOREIGN car which possesses features of interest for Americans is the S. C. A. T., produced in Turin, Italy, particularly as machines of this make won the Targa Florio races of 1911 and 1912 in Italy. The former event was taken by Ernesto Ceirano of Turin, while the victor in the latter was Cyril Snipe of Manchester, England, a young man who had had no previous experience in racing. Snipe represented Newton & Bennett, Ltd., of London and Manchester, which concern fits S. C. A. T. chassis with the N. B. motor starter and wire wheels for the British market.

The chassis described herein is that rated at 22 horsepower and is the same as those of the Targa Florio winners. The motor is a four-cylinder unit, cast en bloc with bore of four inches and stroke of 5.5, giving a piston displacement of 276.5 cubic inches. The rating under the R. A. C. or the S. A. E. formula is 25.6 horsepower. The valves are specially large, mechanically operated, and the valve stems, springs and adjustable tappets are enclosed by a cylinder casting, easily accessible by removing an aluminum cover plate. Ignition is by Bosch high-tension magneto, carburetion by a Zenith automatic vaporizer, cooling by water using a honeycomb radiator, centrifugal pump and a fan incorporated with the flywheel, and lubrication by a circulating system utilizing a rotary pump.



Chassis of the 22 Horsepower N. B. Self-Starting S. C. A. T., Showing Block Motor and General Arrangement of Components.

In the main the construction throughout follows conventional practise. The clutch is a multiple disc. The transmission affords four forward speeds and reverse. The gearbox is provided with two layshafts, below and at the side of the main shaft, and all the brakes are internal expanding, the pedal brake being on the propeller shaft. A large fork ended torque tube is fitted, which encloses the propeller shaft, and this member and the axle consist of two T shaped sections bolted together.

Because of the fact that motor starters are not numerous in Great Britain and because the N. B. has been thoroughly tested under all conditions of service since early in 1910, it possesses more or less interest. The principle involved is the same as that which has been used with success on American cars. A small compressor, driven by the engine and located on an extension at the front end of the crankcase, delivers air to a steel container, from which reservoir it passes through a rotary distributor to the cylinders.

This compressor comprises an air-cooled cylinder with bore of 1.96 inches and stroke of 1.57, the piston of which is actuated by a ball bearing eccentric on the front end of the crankshaft. The reservoir is a weldless steel cylinder 28 inches long and 8.5 inches in diameter, which may be located at any convenient place on the chassis. A rotary valve actuated by bevel gearing from the camshaft controls the admission of air to the engine cylinders in proper sequence, the air entering the cylinders through small non-return valves in the exhaust valve caps. When the engine is running under its own power the rotary valve automatically lifts through suction, thereby, it is claimed, reducing wear on the valve faces. Pressure to the gasoline tank also is maintained from the air compressor, this being reduced by a pressure reducing valve. For the purpose of providing an initial pressure in the tank, compressed air may be admitted from the reservoir through the same valve. Tires may be inflated as with any air compressor.

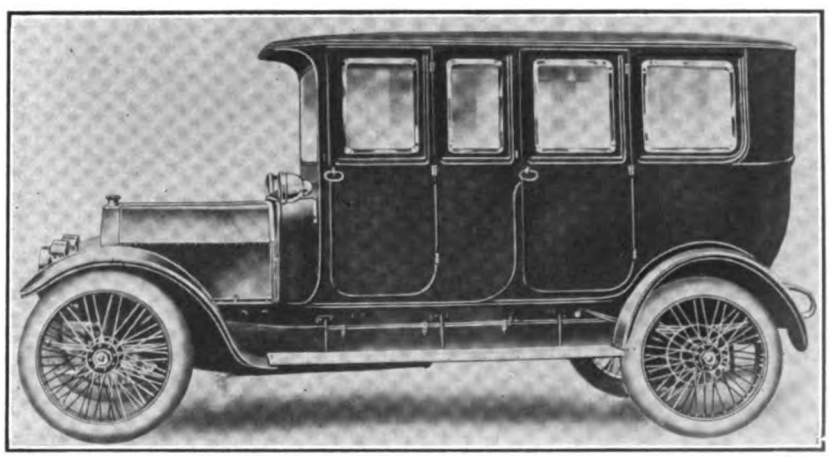
Constructional Details of N. B. Wire Wheel.

The N. B. air starter is protected by so-called Harper patent, as is the N. B. wire wheel. The special feature of this wheel is held to be the conical mounting of the detachable hub on the permanent hub. This is claimed to make the wheel absolutely self-centring and rigid laterally, and thus enables it to cope with the enormous reversed and lateral strains to which a road wheel is subjected. The locking device is self-acting and when the wheel is tightened it is maintained that it cannot be left other than locked.

An accompanying sketch sets forth the features of this construction. It will be noted that the detachable hub D has a tapered or coned interior to accord with the conical exterior of the permanent hub C. A plate retains the hub cap G, which can be rotated and is confined in an annular channel presented by the disposition of the hub D and the plate. The reduced end of the hub C is cut with an external screw thread and the hub cap G has an internal thread to engage therewith. A key takes the drive for the wheel by engaging with the keyway in the detachable hub, but it is claimed that the conical mounting forms a clutch sufficiently powerful to transmit the power without this key.

In the hub cap G is a circular ratchet plate H, provided with ratchet teeth, and this device slides upon two guide spindles secured to the cap and can be retracted against the action of the spring on its spindle. The latter passes through the hub cap and is provided with a head to be acted upon when the ratchet plate H is to be withdrawn.

In applying the wheel the tapered or conical hub D is pushed onto the conical boss C and the hub cap G rotated to force the conical faces into contact. As the hup cap is rotated in a forward direction by turning the spanner, the ratchet teeth lock and backward movement is held to be impossible. To withdraw the wheel the spanner, which is provided with a slidable device to engage with the back of the head and so take the ratchet teeth out of engagement, is applied and the hub cap turned in a backward direction.



BRITISH IMPORTS AND EXPORTS.

Interesting Comparison of French, English and American Foreign Business.

The Manchester Guardian, published at Manchester, England, gives the following table showing the value of the motor cars and parts exported from France, the United Kingdom and the United States since the beginning of the industry. The record starts with the year 1897 with respect to France and 1902 for the other two countries:

	Year ended Dec. 31.		
Year.	United Kingdom.	France.	United States (year ended June 30).
1897	.....	$121,000	.....
1898	.....	340,000	.....
1899	.....	832,000	.....
1900	.....	1,834,000	.....
1901	.....	3,070,000	.....
1902	$837,000	5,883,000	$950,000
1903	1,674,000	9,898,000	1,207,000
1904	1,747,000	13,825,000	1,895,000
1905	2,637,000	19,568,000	2,481,000
1906	4,228,000	26,833,000	3,497,000
1907	6,725,000	28,098,000	5,501,000
1908	6,423,000	24,779,000	5,278,000
1909	8,141,000	28,541,000	5,992,000
1910	13,460,000	31,510,000	11,190,000
1911	17,246,000	30,795,000	15,509,000
1912	.....	.....	25,657,000

The predominance of French exports over British reached its maximum in 1906 and since

Twenty-Two Horsepower N. B. Self-Starting S. C. A. T. Equipped with Pullman Salon Body.

Digitized by Google

then it has declined fairly steadily. It is only since 1904 that the exports of motor cars, motorcycles and parts from the United Kingdom have been considered separately. In the years since then the imports and exports of motor cars have been as follows:

Year	Net Imports Number	British Exports Number
1904	4,964	701
1905	5,046	1,078
1906	5,103	1,379
1907	4,285	2,318
1908	3,396	2,216
1909	3,116	2,580
1910	3,694	3,555
1911	5,731	4,536
1912	6,276	5,282

England still imports a larger number of complete motor cars than it exports, though the excess of imports was only about 1000 in 1912, instead of over 4000 as in 1904, but the value of complete cars exported is greater than the imports. The number of cars imported from the Netherlands decreased from 93 in 1907 to 18 in 1912; Switzerland from 89 to six; Italy, 28 to two; and France, 3613 to 2236, showing how great has been the decline of French cars sold on the British market. On the other hand, the number of cars imported from Germany has increased from 174 to 275; Belgium, 219 to 439; and from the United States, 555 to 3734. France and the United States are still the most important sources of British supply.

DEVELOPING FOREIGN TRADE.

Special Consular Reports Present Conditions and Possibilities Abroad.

An extremely interesting booklet of 70 pages has been issued by the bureau of foreign and domestic commerce, Department of Commerce, Washington, D. C., for free distribution as Special Consular Reports No. 59. The reports set forth existing conditions in many foreign countries and point out the possibilities for American business. No attempt is made herein to present even a brief review of the booklet, but some of the more striking suggestions may be summed up as follows:

United Kingdom—The most talked of matter in the English motor trade is the wide sale of American cars, but several British experts are saying now that their introduction is not to be deplored, as it has stimulated and will continue to stimulate British manufacturers, and has at the same time extended the market. The excellence of the construction has been widely and generously acknowledged. The only points criticised are the finish, the lack of the few additional coats of varnish that would lend distinction, and the uncomfortableness of the seats.

France—Factory owners or managers, the men of intelligence, energy and business foresight, who have created the vehicle and built up its success, should come abroad in person, study the nature, extent and character of the demand, etc. Having decided to make a systematic effort, one or more of the ablest managers, with a full line of sample cars and parts, and a first class mechanic, should be installed in Paris, from which point agencies should be supplied. American automobiles sold in Europe during 1913 will meet the keenest competition that the French and other European makers can organize. Already several leading manufacturers announce reduced prices for their smaller and simpler types and add that they are prepared to produce automobiles on the American plan.

Spain—One of the causes for the small market for American machines is the big profit exacted from purchasers by the agent, which brings the selling price to almost double what is asked in the United States. Care should be used in stating the horsepower, as it appears to be the general practise in Europe to quote the minimum or average, instead of the maximum. The Spanish buyer does not desire a machine of high power.

Russia—Few places in Europe afford better opportunities for the extension of American trade. The high grade expensive machine is having much difficulty in competing with those of European manufacture, but the buying public is gradually realizing that the American car of any grade is fully as good and often in some particulars better than those constructed elsewhere. Some manufacturers are catering to this trade by building their machines on lines similar to those adopted by the progressive and successful makers in France and Germany. They are thus pleasing the public, and evidently in the course of a short time will be on equal grounds with their strong European competitors.

Italy—The first 11 months of 1912 showed continued increases in the sale of low priced, well made American automobiles of good appearance. This may be attributed to the fact that the business and pleasure seeking people have been convinced by satisfactory tests and daily observations that these machines, costing from $1000 to $1600, will answer all ordinary purposes. Italian agents are manifesting special interest in American cars, but complain that while they are splendid machines for the money deliveries are slow and unsatisfactory.

Switzerland—Dealers express the opinion that they could sell an American car delivered in Switzerland to retail at $1200 to $1600, at a good profit in the form of a discount to the agent. American firms established in Paris probably can enter this market through Geneva, and once a footing is obtained, German Switzerland, with headquarters at Zurich, should follow.

India—A substantial increase is noted in the importations from the United States, which is now in second place. The American car sold at prices up to $2000 has won its way absolutely on its merits, and with the assistance of very little advertising as compared with the space used by Continental and British manufacturers.

Japan—Two American manufacturers have sent special representatives, one establishing a general agency with branches in other parts of the Far East. One dealer intimates that some 1200 cars will be sold within the next two years, and that at least 70 per cent. of them will be American made low priced machines.

NEWS NOTES FROM ABROAD.

In connection with the forthcoming visit of the British Institute of Automobile Engineers to America, a movement is on foot to extend the trip to the Pacific Coast at the conclusion of the official tour planned by the American Society of Automobile Engineers.

The 1913 Targa Florio race will be held on the island of Sicily May 11-12. Instead of being a non-stop contest, the event will be run in two sections, from Palermo to Girgenti the first day, and back to Palermo the second.

The court of appeal in Great Britain has found for the defendant in the case of Knight & Kilbourne vs. Argylls, Ltd., for alleged infringement of the Knight sleeve valve motor patent. This decision confirms that of the lower court. It will be remembered that this action was based on the first Knight patent, which was for a single sleeve motor.

Digitized by Google

CORRESPONDENCE WITH THE READER.

Selecting Files.

(1517)—In your article on equipping the garage you make mention of the desirability of selecting tools of good quality. They inform me that there is a difference in files. How are you to tell the good from the inferior makes? OWNER.
Charlotte, N. C., March 24.

In purchasing a file it should be balanced on one finger midway its length, and struck lightly with some hard body. If the tool be a good one it will ring almost like a tuning fork. The file should next be held nearly level with the eye, the light falling obliquely up its teeth, which should present a perfectly regular and even appearance viewed from either end. The color should be a dull, silvery gray, free from spots or mottling, except at the end or tang, where it is tempered.

Haynes Motor.

(1518)—What is the bore and stroke of the 1912 model 21 Haynes car? Was the cylinder cast singly or in pairs? Also give wheelbase, type of clutch and axle. W. J. D.
Tampa, Fla., April 1.

The bore and stroke of the 1912 Haynes, model 21, was 4.5 by 5.5. The cylinders were cast in pairs, of the T head type, and were offset .25 inch. The clutch was a Haynes, a contracting steel band on a bronze drum, supported by the crankshaft. The rear axle was a Timken, full floating type. The wheelbase was 120 inches.

Gear Ratio of K-R-I-T.

(1519)—I desire to know what is the gear ratio on the 1913 K-R-I-T car, having a 3.75-inch bore and four-inch stroke. One party says it is 3.625:1 and another 4:1.
Billerica, Mass., April 13. R. H.

The gear ratio of the 1913 K-R-I-T car, to which reference is made, is 4 to 1; that is, the final gear ratio.

Locating Ignition Troubles.

(1520)—Kindly give me your method for locating which part of the ignition system is at fault. In timing valves you place the flywheel 10 degrees past dead centre, exhaust about to close, and inlet about to open, then replace idler gear and lock it. Does that answer for the rest of the valves or do you have to give the flywheel another half-turn to time the No. 2 cylinder and so on? C. W. S.
Woodlawn, N. Y., April 15.

To give complete instructions for locating ignition troubles would require considerable space as there are many causes for irregular operation. The writer suggests procuring copies of the A B C of Battery Systems and A B C of Magneto Systems, published by The Automobile Journal Publishing Company, which may be found at the leading newstands. The booklets will not only enable the reader to locate and correct all ignition troubles, but explain in detail the construction, operation and maintenance of all systems.

The second question was answered fully in the Feb. 10th issue of The Automobile Journal, a copy of which has been forwarded.

Soap for Garage Purposes.

(1521)—I wish to know about all makes of soaps for motor and garage purposes. S. W.
Boston, April 17.

There is a large number of concerns manufacturing soaps for the work referred to and the information desired will be found in the Classified Buyers' Guide, published elsewhere in this issue.

Leaky Storage Batteries.

(1522)—I have a three cell storage battery lead type, which leaks acid very badly. It will not hold a charge; that is, it becomes exhausted very quickly after it has been charged. The man in charge of the battery station informs me that the cells can be repaired, but it may cost as much as $10, depending on the amount of work to be done. Would you advise having the battery repaired or purchasing a new one? SUBSCRIBER.
Providence, R. I., April 18.

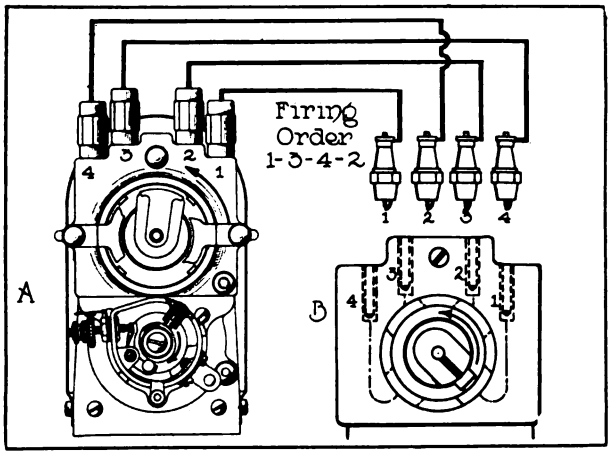
If the battery is an old one and in the condition stated it would hardly pay to have it repaired. A battery expert might be consulted and possibly he would disassemble the cells and give an estimate as to the work required, cost and probable service the battery would give after an overhaul. It may be that the plates are well sulphated and while the trouble sometimes may be corrected by a long charge, the writer is of the opinion that it would be more economical to purchase a new battery.

Rewiring Magneto.

(1523)—Having occasion to replace the high-tension cables on my magneto with new wires, I could not start the motor. It back fired and kicked. I am pretty sure I put the wires back properly. The shaft driving the magneto runs to the right and I began on the left side of the distributor to replace the wire leading to the first cylinder; that is, when looking at the breaker box end of the magneto. What is the trouble and how shall I remedy it? A prompt answer will be appreciated as I want to get my car running and do not want to call in a repairman as I live some distance from the city.
APPRECIATIVE.
Nashua, N. H., April 14.

The trouble is due to improper wiring; that is, the cables were connected without regard to the rotation of the distributor. The error is frequently made by those not familiar with the construction and operation of the magneto and who imagine that the distributor arm rotates in the same direction as the armature shaft or that member driving it.

Mounted on the armature shaft is a gear which is meshed with another twice as large as the first named gear. With the armature gear rotating clockwise, looking at the breaker box end,



Digitized by Google

the distributor gear will revolve in the opposite direction. Consequently the leads or high-tension cables will be connected, starting with the No. 1 cylinder at the right hand side of the distributor housing.

These points are brought out clearly in an accompanying illustration, the drawing at A showing the breaker box, and the arrow denotes the direction of rotation of the armature shaft. The distributor housing is outlined with its cover removed to show the distributor arm and it will be seen that it revolves to the left or anti-clockwise.

For convenience the secondary terminals are numbered 1, 2, 3 and 4, beginning at the right, as the arm makes contact in this order. The sketch at B illustrates the segments and the connections to the terminals, to which are secured the leads.

The wiring plan of a four-cylinder motor firing 1, 3, 4, 2 is shown at A with the plugs similarly numbered. It will be seen that the No. 1 terminal on the magneto is in circuit with the No. 1 plug. As the next cylinder to fire is the No. 3, and the second contact to be made by the distributor arm is the No. 2, the wire from the latter is led to the third cylinder. The third contact to be made is the No. 3 and this is connected to fourth cylinder. The last connection to be made will be from the No. 4 terminal to the second cylinder. In wiring a four-cylinder motor firing 1, 2, 4, 3, or a six-cylinder unit, the order should be maintained; that is, the connections between the distributor to the cylinders should be made in the firing order.

Wiring the Magneto: A, Illustrating Direction of Armature Shaft, Distributor Arm and Connections Between Terminals and Spark Plugs; B, Showing Order of Contacts Made by the Distributor Arm.

S. A. E. Horsepower Formulae.

(1524)—Will you kindly let me know how you get at the S. A. E. horsepower rating? I am unable to find out here. We have an R-C-H rated at 25 horsepower, while you give the rating in your March 10th issue as 16.90. Our legislators have a bill under consideration to tax on the horsepower which if passed would make a considerable difference. Which is the correct rating of the R-C-H horsepower? H. E. R.

Vitoqua, Wis., April 15.

The S. A. E. formula was fully explained in the April 10th issue of The Automobile Journal. It is based on a piston speed of 1000 feet a minute and is obtained by squaring the bore, multiplying this by the number of cylinders and dividing by 2.5. Only the bore is taken into consideration.

The 16.90 horsepower referred to in the March 10th issue is the S. A. E. rating, while that of 25 is given by the company. And it may be stated that the majority of cars will develop considerable in excess of the rating given by the S. A. E. formula, particularly motors in the long stroke class.

Measuring Radiator and Hoods.

(1525)—I have an old model car and the radiator has been soldered so many times that it is useless for cooling. I cannot get a new, similar one, as the company has gone out of business. I note a number of radiators advertised for sale and wish to get one. How can I tell if they will fit my car? How are they measured? A. D. W.

Evansville, Ind., April 16.

There are a number of measurements to be considered, especially those having to do with the mounting of the cooler. If the old radiator is retained by studs and sets deeply in the retaining member between the side members of the frame, the width must be accurate.

In an accompanying illustration are shown the most important points to be considered in taking the measurements of the old radiator and it will be noted that the stud holes are marked 1" D. However, if the studs of the new cooler are larger the openings in the retaining member may be enlarged.

Unless the shape of the new cooler is similar to that of the old one it will be necessary to fit a new hood and the method of securing the measurements is also outlined in the sketch. Care should be exercised in selecting a new radiator to make sure that the starting crank will not interfere with its fitting. Unless sure of the measurements it would be best to make arrangements with the dealer to permit of trying the cooler upon the car before purchasing. The location of the inlet and exhaust pipes will require consideration as well as other measurements. It is possible that the old radiator was manufactured by some cooler concern which could supply a new one. As the make of the car was not mentioned this information cannot be given.

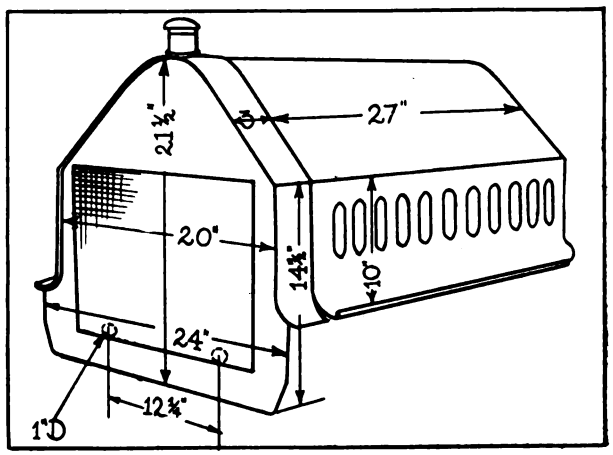
Glass for Windshield.

(1526)—I wish to replace the lower glass in the windshield of my 1910 Cadillac car. The size of the glass is 16 by 40 inches. What will it cost and will it be necessary to send the shield away to have a new glass fitted? It broke or cracked in two with the car rounding a curve on a grade at moderate speed. The road was fairly smooth. What caused the glass to break? Is it a common thing? How can it be avoided? M. F. C.
Truro, Mass., April 21.

It is not possible to give figures as to the cost of the stock and labor, but it ought not to be expensive. It should not be necessary to send the shield away as a lower glass could be fitted by any glass worker. It is possible that the work can be accomplished at Middleboro or some convenient town.

As to the cause of breaking it may have been due to a stone thrown up by a tire or to the dash springing and twisting the frame of the shield. It would be difficult to state the cause in the case mentioned. It is suggested that the body bolts be examined to note if they are tight and those securing the shield to the dash also should be inspected.

Rectifier for Ford Cars.



(1527)—Is it possible to fit a rectifier to a model T Ford automobile to change the alternating current into direct and charge a storage battery when the motor is operating? I was told that the Wagner Electric Company of St. Louis, Mo., makes a type adapted to Ford cars. FORD ENTHUSIAST.
New York City, April 14.

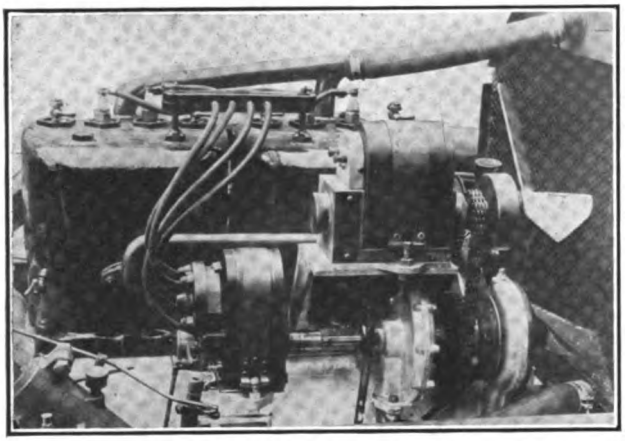
The Wagner Electric Manufacturing Company states that its rectifier is not adapted for changing the form of alternating current produced by the Ford magnetic needle. The reason for this is that as the Ford magneto is connected to the engine it varies with motor speed and the frequency of the current generated by the magneto manifestly varies through the same range of cycles as does the engine speed.

The alternating current rectifier made by the company requires a constant frequency, as it operates on the vibrating reed principle, the reed being tuned in length and weight to a special frequency. It will not vibrate synchronously except when operated on this frequency. The reed is like a pendulum in that it has a set rate of vibration, which is determined by its length.

Even if the magneto would charge a battery through a rectifier, it would be more expensive, as considerable gasoline would be consumed in the operation. In charging storage batteries it is important that the rate recommended by the maker be observed strictly. As the frequency of the current developed by the Ford magneto would vary with the car in operation, the utilization of a rectifier would not be practical. Another factor to be considered would be the use of a cut-out, as it would be essential that the magneto be cut out when its output fell below that of the cells. Otherwise the battery would discharge through the magneto. On the other hand it would be difficult to regulate the charging rate, which is important in charging cells.

The Ford magneto was not designed for charging batteries and if these are utilized on the car it is best to have them charged at a regular station or to utilize the garage or house current. If the latter be alternating it can be employed in connection with a rectifier and there are several designs made especially for the work, among which are the Wagner, Edison and Westinghouse. Chas. E. Miller, 97-103 Reade street, New York City, and the Bi-Motor Equipment Company, 180 Massachusetts avenue, Boston, also handle these devices. A description of the Westinghouse rectifier will be found elsewhere in this issue. It will be noted that the direction of the

Illustrating Method of Measuring Radiator and Hood.



charging current varies or alternates. By this is meant that the current flows first in one direction, north for example, until it attains its maximum, then in the opposite direction, or south.

A minister of Los Angeles, Cal., has made the statement that the motor car is drawing people to church who seldom or never attended divine service before. His fellow pastors of the city, assisted by newspapermen, made a thorough canvass of the city and proved his contention. The minister in question holds that while it may be true that the automobile has drawn some people away from church, the fact that the streets near churches are lined with motor cars during Sunday morning services is proof positive that the vehicles have worked for much good, as they get people out early in the morning for a ride, after which they attend service.

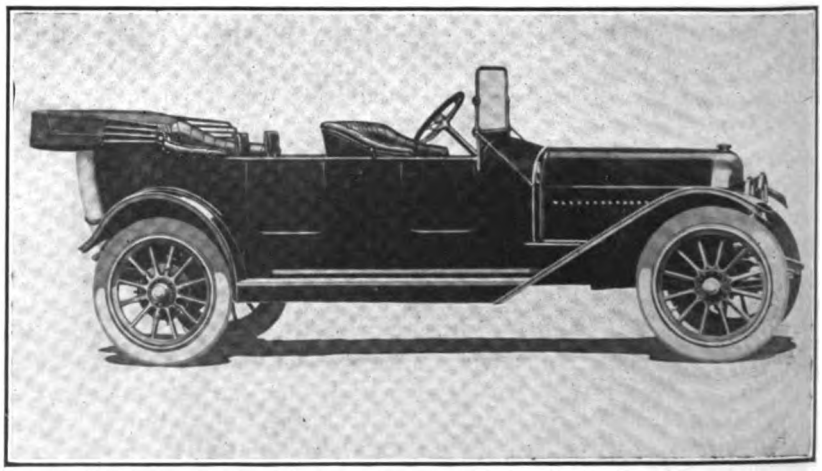
JACKSON LINE INCLUDES THREE MODELS.

THREE models, the Sultanic, Majestic and Olympic, constitute the 1913 line of the Jackson Automobile Company, Jackson, Mich.,

Power Plant of the Jackson Majestic, Showing Location of Lighting Dynamo Driven by Silent Chain.

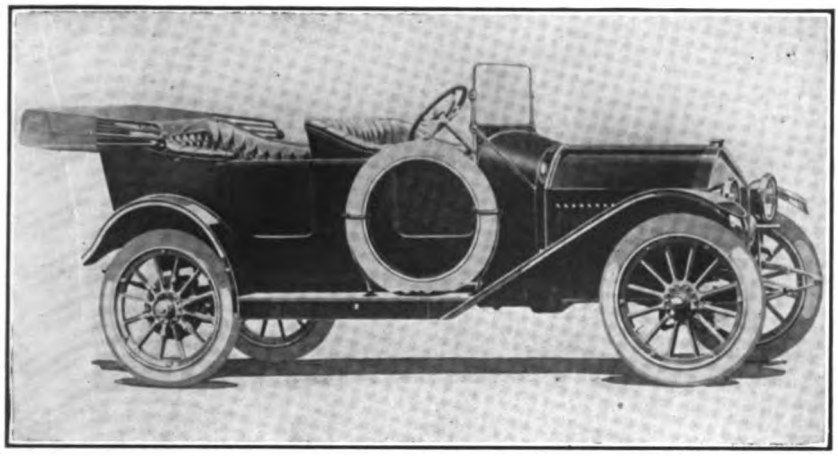
and each are of the touring type, five and seven-passenger seating capacity. Although the designs may be said to be entirely new the principles of mechanical construction entering into the previous chassis have been retained. The equipment is very complete, comprising electric lighting and motor starting and including those accessories making for comfort and convenience.



The size of the motor in each model is proportioned to the weight of the car and the load it is designed to carry, and is sufficient to meet all requirements of service. All three chassis are fitted with the unit power plant, differing in the bore and stroke. The Sultanic is a six-cylinder, with a 4.125-inch bore and 4.75-inch stroke and is rated at 55 horsepower. Both the Majestic and Olympic have four-cylinder motors, the former having a bore of 4.5 inches and stroke of 5.25, rated at 45 horsepower, while the bore and stroke of the Olympic is the same as that of the large car.

All three have enclosed valve mechanism. The bearings are liberal in size throughout and very accessible. Ignition is by a magneto with dry cells for starting, and on the Sultanic and Majestic the lighting battery may be utilized if desired. The gasoline capacity of each model is 20 gallons with the service tank located under the dash and at sufficient elevation to provide a positive feed by gravity. The main fuel supply is carried at the rear, easily accessible for filling, and the fuel is forced to the forward tank by a pressure pump on the dash. A gauge indicates the amount on hand.

Lubrication is by a force feed system, the oil being taken from a large reservoir in the engine base and forced to the bearings by a mechanically driven pump. A sight feed gauge is located on the dash. The clutch hub and yoke bearings are lubricated through a hollow shaft from the transmission, which is of the selective type, affording three speeds forward and reverse. All gears are large with shafts rotating in high grade ball bearings.



The Sultanic is fitted with a full floating type of rear axle and ball bearings are employed throughout. The other two models have a semi-floating rear axle with roller bearings, but ball thrust members. Full elliptic springs are used both front and rear and the conventional drop of the frame makes for a low centre of gravity. All spring bolts, steering knuckles, tie rod pins, etc., are lubricated by grease cups. The front axle is of the conventional I beam section type with tie rod at rear, and the knuckles and steering linkage are sturdily constructed.

The tires are sufficiently large to care for overload, the Sultanic being equipped with 36 by 4.5-inch, while the Majestic and Olympic have 36 by four and 34 by four-inch shoes respec-

Jackson Sultanic Touring Car, Having Six-Cylinder Motor Rated at 55 Horsepower, Fully Equipped, Including Electric Lighting and Motor Starter.

Digitized by Google

Jackson Majestic, a Five-Passenger Touring Car, with Roomy Body and Attractive Lines.

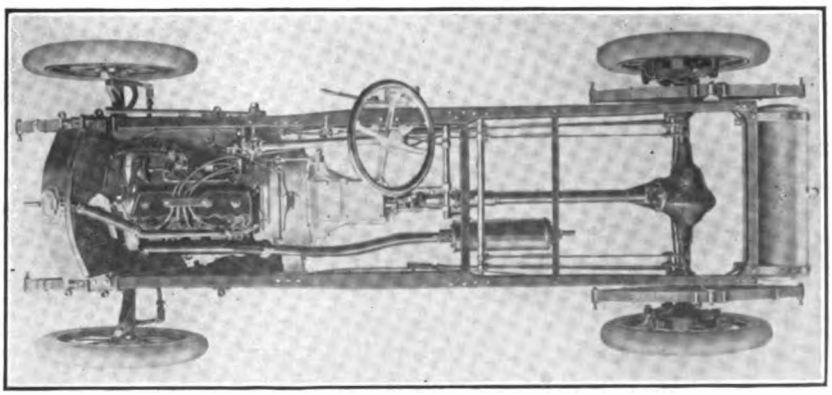
tively. The last two named types have quick detachable demountable rims with one extra member as standard. Demountable wheels with detachable rims are fitted to the Sultanic, being demountable at the hub flanges, and it is held that accuracy of alignment is secured through a machined joint between the removable and fixed member. The spare wheel fits equally well over front or rear hubs.

The wheelbase of the models varies, the Sultanic being 138 inches, while that of the Majestic and Olympic is 124 and 115 respectively. The standard tread is 56 inches, although option is given at 60. The steering gear is of the worm and gear type, constructed in the factory of the company, and makes for a large factor of safety. The gear is completely cut, although but one-quarter of its circumference is utilized. This provides means for adjustment which is accomplished easily. The driver is located at the right.

The Sultanic and Majestic are equipped with electric starting units operated by a switch member convenient to the driver. A Disco gas starter is standard equipment on the Olympic. With the exception of the last named all models have electric lighting dynamos. Gas headlights and oil side and tail lamps with a Prest-O-Lite tank are utilized on the Olympic, which model is provided with a device for lighting the gas lamps by electricity.

All three bodies have ample room for the passengers, being extremely wide. The seats are provided with 10-inch cushions with eight-inch seat backs, and there is plenty of foot room. Both Turkish and high grade leather is employed throughout.

Each model is completely equipped, including mohair top, side curtains and boot, ventilating windshield, speedometer, oil and gasoline gauge on dash, extra rim, tire holder, electric horn, coat and foot rails, pump, tools, jack, etc. Dark blue with black and nickel trimmings is the standard color with the Sultanic and Majestic and dark maroon with the Olympic.



The finish is high grade, and numerous coats of paint make for durability. Throughout attention has been paid to small details and each part is proportional in harmony with the whole.

STILL ANOTHER TIRE COMPANY.

Morgan & Marshall Concern Will Erect Plant in East Liverpool, O.

The Morgan & Marshall Co-Operative Rubber & Tire Company, East Liverpool, O., which was organized recently, will erect new buildings, instead of purchasing the old Warner-Keffer property as was at first contemplated. It was decided that the best policy was to secure a modern plant in every particular.

It is expected that the factory will be ready for the manufacture of automobile tires and rubber sundries by July 1, and that about 100 skilled workmen will be employed at the start. The equipment will be of the very latest type in every particular and the company announces its intention to specialize in tires for heavy duty cars.

BOSCH SUPPLY STATIONS.

Each Displays a Distinctive Sign, Which Insures Willing Aid to Users.

The constant growth of the Bosch Magneto Company, New York City, maker of Bosch magnetos, plugs and ignition apparatus, has made it necessary to establish a large number of supply stations throughout the country. For some time, besides the main office in New York, fully equipped branches have been maintained in Detroit, Chicago, San Francisco and Toronto. Last year a number of Bosch distributors were appointed, each with a distinctive sign to acquaint users of these products with the location of an establishment with facilities for adjustment and cleaning, as well as for the complete installation of equipment on automobiles. As a result these distributors are able to handle the bulk of the repairs, etc., in their respective districts, by reason of the fact that the men employed have received special training with the Bosch company.

Sign Designating Office of Bosch Supply Station.

The latest move is the appointment of a large number of official Bosch supply stations in the larger towns and cities of each distributor's territory. Such supply stations are subsidiary to and act in conjunction with the official distributors. Their function is practically that of a sub-distributor, each being required to carry a stock commensurate with the needs of its district and to be capable of rendering assistance to Bosch users in the way of installations, minor adjustments and technical help. Each is designated by a distinctive sign, a reproduction of which is shown herewith. The following appointments have been made recently:

Lemke Electric Company, Milwaukee, Wis.; Miller-Dudley Company, Washington, D. C.; Beverly Garage, Staunton, Va.; Virginia Motor Car Company, Petersburg, Va.; Dan Valley Motor Company, Danville, Va.; Fairchild Auto Company, New Orleans, La.; Ozburn Auto Supply Company, Memphis, Tenn.; Drennan Motor Car Company, Birmingham, Ala.; Chester Motor Car Company, Nashville, Tenn.; Hobbie Motor Car Company, Montgomery, Ala.; Mobile Auto Company, Mobile, Ala.; Woodside Motor Company, Charlotte, N. C.; American Ball Company, Providence, R. I.; Bakersfield Garage & Auto Supply Company, Bakersfield, Cal.; Ballou & Wright, Seattle, Wash., and Portland, Ore.; E. A. Featherstone, Los Angeles, Cal.; Herring Motor Supply Company, Des Moines, Ia.

It is of interest in this connection to note that 23,773 magnetos were shipped from the factory in Springfield, Mass., during March, which is considered by the company as a new record.

PANAMA-PACIFIC EXPOSITION.

Seeking to Interest Automobile Manufacturers in Separate Building.

Those interested in the exploitation of the Panama-Pacific international exposition to be held in San Francisco in 1915, are still anxious that the automobile industry shall occupy a separate building. A recent announcement dated April 3 and signed by H. M. Wright of the editorial department, division of exploitation, contained the following:

After negotiations lasting nearly a year, the National Automobile Manufacturers' Association, at a meeting of its executive committee, agreed to sound manufacturers of the country as to their willingness to subscribe for the necessary amount of space to put up a building; the price was set at $2 a square foot of net space, the site being donated by the exposition management. Thus far the replies from the manufacturers have not come in rapidly enough to assure the building, as many manufacturers did not desire to make commitments two years in advance of the opening of the exposition. Unless some immediate action, however, is taken it will be necessary to relinquish the location chosen for the palace and perhaps to abandon altogether the idea of a separate building. We are very sure that when the manufacturers realize the importance of taking early action the demand for space will fill a building double the dimensions of the one contemplated.

In reply to a letter addressed to Samuel A. Miles, general manager of the National Association of Automobile Manufacturers, the situation with reference to that body is set forth as follows:

The facts are that this association agreed with the exposition authorities to sound the trade and ascertain whether there is a sufficient demand for space to warrant the construction of such a building at the expense of the industry; that we did consult the trade and did not find the manufacturers sufficiently interested in the subject to proceed further, and that at our meeting in March it was decided to take no further steps in the matter.

This information was immediately transmitted to the exposition authorities and was sent to the trade press. Since that time we understand a movement has been started in California to erect a separate building, but concerning this we have no definite information, nor has the association been consulted.

INTERNATIONAL SWEEPSTAKES.

Foreign Cars for Third Annual 500-Mile Race on Indianapolis Motor Speedway.

The third annual 500-mile race on the Indianapolis motor speedway, Memorial Day, will be international in fact as well as in name. This event has been termed the international sweepstakes, and while in former years cars of foreign make have competed there has been no effort on the part of the European manufacturers to be represented. This year at least three countries, Great Britain, France and Italy, will have machines direct from the factory in the contest.

Herewith are presented reproductions from photographs of three of the best known foreign racing drivers who will take part. Albert Guyot will drive a Sunbeam, made in England, while Jules Goux and Paul Zuccarelli will pilot Peugeot cars, made in France. It also is understood that the Isotta Fraschini factory in Italy intends to send three machines to this country for the race.

Three Foreign Drivers Who Will Compete in Indianapolis Memorial Day Race: Left to Right, Jules Goux, Peugeot; Albert Guyot, Sunbeam; Paul Zuccarelli, Peugeot.

Guyot belongs to the old school of French drivers. In 1908 he won in the light car class for the French Grand Prix, and has taken hundreds of medals and trophies by his cool headed, scientific driving. Goux is best known as the winner of the Sarthe Grand Prix last year, although he has been victorious with Peugeot cars in a large number of important events. His machine in this event will be a duplicate of the model driven to win last year's Grand Prix. Zuccarelli is an Italian, but he has been driving French cars for years. He also is a long time winner and a fitting teammate for Goux.

GLIDDEN TOUR ROUTE.

Lakes-to-Gulf Plan Appears to Have Been Abandoned in Favor of Northwest.

A report from Detroit states that the American Automobile Association has returned to New Orleans its $1000 payment, which was made by that city to secure the finish of the Glidden tour from the lakes to the gulf, for which the routing was made last August by a Flanders electric. Accordingly, it is understood, the national tour start committee, composed largely of Detroit men, has abandoned further efforts.

The probable route of the 1913 tour is expected to be from the "Twin cities," Minneapolis and St. Paul, to the Yellowstone and Glacier parks, following closely the lines of the Northern Pacific Railroad. The plan includes the same arrangement as was followed in the tour from Denver to Detroit in 1909 when a hotel train, composed of sleeping cars, accompanied the tourists.

Jules Goux, driving a Peugeot car, created new world's class records on the Brooklands track, Weybridge, England, early in the month, his time for the flying half-mile being 0:16.58; flying kilometer, 0:20.79; flying mile, 0:33.87; 10 laps (approximately 25 miles), 16:04.9. Later he drove 107.5 miles in one hour. The car was rated at about 30 horsepower.

SCIENTIFIC MOTORING LAW.

The so-called scientific motoring law suggested by Job H. Lippincott, state commissioner of motor vehicles in New Jersey, deserves careful consideration. It is possible to disagree with his conclusion that reciprocity as now established is a failure, and at the same time grant that the proposition advanced by him was not formulated without serious thought. Those who have advocated federal supervision of highways and a federal registration of automobiles, will have little difficulty in following the plan for interstate licenses, bearing something in the nature of coupons entitling the motorist to enter other states at will.

New Jersey has long labored under an erroneous conception of the value of reciprocity as applied to interstate touring. It is not a question as to whether the residents of other states wear out more Jersey roads than Jersey citizens wear out in other commonwealths. Instead, New Jersey must decide whether its share of the business which naturally follows unrestricted interstate touring offsets the damage that may be occasioned to the highways.

The proposed law may be scientific in its fundamental principles, but it can be foreseen that its application may be no easy task. Judging from the wide variance in registration fees demanded by the different states, this subject has by no means been reduced to a scientific basis as yet. It would seem that much could be accomplished by a consultation among commissioners representing the several commonwealths, such as has been suggested by New York and agreed to by Delaware.

THE EFFECT UPON THE INDUSTRY.

The automobile industry is extremely fortunate in escaping serious loss as a result of the recent floods in Ohio and Indiana. This has special reference to the manufacturers of cars and accessories located within the stricken district, all of whom appear to have been delayed but slightly in their ability to fill orders and resume business. However, these floods and the tornado which visited Omaha a few days previous to them will have an appreciable effect upon the industry.

While thousands of individuals lost heavily, American business enterprise refuses to consider the possibility of failure. Those portions of the country which were the subject of charitable contemplation a few weeks ago will soon present a most satisfactory market in every practical field. The important part played by motor cars of all types in the work of rescue and rehabilitation was such as to establish their practicability beyond question, and this is particularly true of the commercial vehicles.

The possibilities for automobile business abroad, as set forth in the special consular reports, seems decidedly bright. Europeans apparently have discovered that quantity production is not made at the expense of quality, and it is most significant that French makers are announcing their ability to produce cars on the American plan. The competition is to be keen, but the demand for American machines forecasts another big year for the exporters. The outlook is particularly hopeful.

Digitized by Google

MAKERS DISCUSS PERTINENT SUBJECTS.

DUE to the systematic campaign of education inaugurated by the motoring publications, with the co-operation of automobile and accessory manufacturers, the American motorist has a thoroughly practical knowledge of his car and its fittings. However, a considerable percentage of the vehicles produced and marketed each year reaches the inexperienced, and this fact, coupled with the introduction of new features, makes it necessary not only to continue the educational work, but to revert at times to matters which may appear to the majority to be somewhat elementary.

That there is real need for review of fundamental principles and their application is evidenced by the treatment of subjects for publication by the engineering departments of some of the best known concerns in this country. It may be taken as established that these manufacturers are in a position to learn the need for the dissemination of this character of information. This note will be discovered in some of the communications presented below, but whether the reader be an experienced motorist or a novice, there is little doubt that a consideration of the subject from this viewpoint will prove of distinct value.

CARE AND REPAIR OF TIRES.

Suggestions for Increasing Mileage, Making Roadside Repairs and Vulcanizing.

Tires are an important factor in the cost of maintenance and the failure of an owner to obtain maximum efficiency is often due to not giving these members the attention they require. The following letter from a prominent manufacturer is of interest in that it contains valuable hints on the repair of shoes and inner tubes, as well as suggestions for preventing trouble:

Probably an automobile tire has to stand more rough usage than any other part of the car, and without a doubt it receives, in nine cases out of 10, less attention and care than any other part. There are a number of things that every automobile owner can do for his tires that will not only enable him to anticipate and avoid roadside troubles and delays, but will add greatly to the mileage obtained. Or, to put it in another way, he can secure the mileage for which he has paid and which the manufacturer expects him to get.

The importance of inflation to the pressure recommended by the tire maker cannot be over-estimated. Unless tires are kept pumped up full and round under the weight of the loaded car the fabric will be continually bent as one point of the tread after another adapts itself to the irregularities of the road. Consequently the fabric is weakened and disintegrates like a much used leather hinge. A hard tire, too, is less liable to puncture or cutting by sharp stones, nails, etc.

One of the surest ways of spoiling a tire is to allow it to stand in a puddle of oil on the garage floor. Oil, and especially gasoline, will dissolve rubber. Tires should not even be wiped with oily waste. Carelessness about this one point has helped many tires to premature failure.

Rust is one of the worst enemies of canvas and rubber. It may collect on the steel rims after the car has been washed or driven through mud, and water has worked in between rim and tire. The remedy is removal of the tire, a thorough sandpapering of the rim and a coat of shellac. This should be done at least once a season as not only does it prevent rusting, but it facilitates removal of the tire in case of a puncture.

When inserting a new tube or replacing the old one after a repair, the inside of the casing should be dusted with plenty of powdered soapstone (graphite may be used). This prevents kinking or pinching of the tube and by reducing the friction between tube and casing, keeps the tire from heating on a long run and saves wear of the rubber.

Unless extra tubes and an extra casing are carried, the motorist may be obliged to stop for roadside repairs, which are unpleasant to say the least. One does not take a trip for experience in tire repairing and it pays well to see that these extra tubes and casings are kept in first class condition.

The extra casing usually carried for roadside emergencies ought to be protected from light, heat and dampness. In lieu of a special tire cover, a winding of rubber cloth is sufficient, but perhaps not so satisfactory if appearance is a consideration.

If extra tubes are carried as is usually the case, don't throw them loosely into the tool box or under the back seat. You might as well throw them away, for the tools will chafe, and the oil will rot them until they are worthless by the time they are needed. To be carried safely, tubes should be dusted with soapstone, folded carefully and tied, not too tightly, with wide tape. They ought then to be kept in a soft canvas bag, also well dusted with soapstone, and carried in some part of the car where heat and oil cannot reach them. As a spare tube deteriorates quickest at the sharp bends made in folding, it is a good idea to refold it once in a while so that the creases come in new places.

For temporary repairs sufficient to bring the car home without having to run on a flat tire, there are a number of accessories that may be profitably carried. Among the most important are the tire sleeve, to lace around a casing after a blow-out, and the blow-out patch, to place between tube and case. These are generally used together, the sleeve to prevent the entrance of dirt and the patch to keep the tube from bulging into the hole.

For temporary roadside tube repairs, should they be necessary, cemented patches may be used. It is best to use the patches prepared by the tire makers, but if the patch be cut from an old inner tube, it is preferably cut round and ought to have the edges bevelled. A square patch sometimes loosens at the corners. Small nail punctures can be covered by a patch about two inches in diameter. Scrub the point of repair for an area at least an inch larger than the patch with gasoline and clean waste to remove the soapstone and sulphur, then roughen the surface with sandpaper. Cover the patch and the clean place with a thin coating of rubber cement and let it dry thoroughly. Then apply a second coating and when the moisture has all evaporated apply the patch, pressing it down firmly. Clamp it, if possible, between two flat blocks for a few minutes or hammer it all over with a wooden wrench handle. Be sure that the cement has set thoroughly before inflating the tube.

By far the best method, and one which makes permanent repairs, is vulcanizing. This consists in filling the hole with a plug of uncured Para rubber such as the tire was originally made of (it can be obtained from any supply house) and curing it by applying heat at 265 degrees Fahrenheit for a few minutes. The result is a repair that is actually welded into and a part of the tire, so that no amount of service will loosen it. One could vulcanize with any hot iron, but the result in the hands of a novice would probably not be successful on account of the difficulty of maintaining a temperature high enough to vulcanize the repair without endangering the tire by overheating. By the use of a good vulcanizer, one on which the temperature is controlled automatically

Digitized by Google

by a thermostat, vulcanizing a tire is as simple and speedy as sticking on a patch. No attention need be given the vulcanizer while it operates, because the temperature cannot run high enough to overcure the repair. The vulcanizer is heated by electricity or an alcohol lamp while preparing the tire and then clamped over the repair for a few minutes. No skill or experience is required to operate these machines as they are designed especially for use by any motorist.

The greatest advantage of having a vulcanizer in the private garage is that it puts the motorist in a position to mend stone cuts, etc., in the treads and sides of casings without even letting the air out of the tire. There is no other satisfactory way of mending such cuts, which if neglected, will admit moisture to the fabric, rotting it until a blow-out ruins the tire. A good tire will run 10,000 miles if the fabric is protected from foreign substances, so the importance of sealing every injury is evident.

The inconvenience of sending tires to the repair shop for repairs and the prohibitive expense of having every small cut vulcanized, often deter the motorist from even trying to keep them shipshape. Not only will a vulcanizer that he can operate himself save him practically all of his tire repair expense, but it will enable him to get double or even treble service from his casings.

CONCERNING STORAGE BATTERIES.

Information as to Treatment Necessary to Insure Their Maximum Efficiency.

The following suggestions for the resuscitation and care of storage batteries were contributed by the engineering department of a prominent battery maker whose instructions are based upon years of experience, and which if followed will result in maximum efficiency:

The almost universal adoption, by car manufacturers, of electric lighting and starting systems, has necessitated the use of storage batteries to an extent never before reached. This has resulted in placing thousands of storage batteries in the hands of users whose knowledge of them and of their proper maintenance, at the best, can only be elementary.

The storage battery, properly handled, is a most efficient and uncomplaining servant, but like a good watch or any piece of machinery, it is neither trouble nor fool proof and will suffer from lack of care or unintelligent handling. Storage battery ailments, as a matter of fact, are really very few, but as the most annoying one is a so-called "dead battery," the following instruction for its resuscitation may prove of benefit to users:

Should your battery become dead, first ascertain if the generator is putting up its proper amount of current; a storage battery is not a creator of energy and depends for its supply upon the generator, which is driven by the engine. If you find your battery dead at any time, introduce an ampere meter in the battery circuit and see how much current is being delivered by the generator at different speeds—eight, 12, 16 and 20 miles an hour. If the generator is designed to give an output of 10 amperes at 12 miles an hour, and if you are only getting seven amperes at this speed, it should be adjusted to give its full output.

When a storage battery is allowed to fall behind it will not store the energy supplied by the generator even though the latter is giving its output, for the reason that the battery has gotten into a stale condition and does not properly take a charge. If investigation shows that the generator has not been giving its rated output, and the battery has fallen behind, it should be taken to a garage and charged according to directions given on the battery name plate. Adjust the generator so that it delivers the output claimed by the manufacturer of the car or generator; put the battery back into service and as long as the generator gives its output there will be no lack of light or power for starting.

Some manufacturers furnish with their apparatus an ampere meter, which is placed on the dash of the car and shows the amount of current passing into the battery. This is very desirable as it indicates whether there is any interruption of current due to any cause whatever and also whether the generator is giving its full output. It will be readily understood how valuable this kind of an instrument is when consideration is given to the fact that a battery may become dead and possibly ruined by lack of knowledge of conditions existing in the generator.

Faulty lamp sockets may also cause a storage battery to lose its current. After proceeding as above, if the cause of your trouble has not been located, examine your lamp sockets and look for looseness and poor contacts, which should be corrected at once. Investigate the switches in both the lighting and starting circuits and make sure that they return properly to the "Off" position when current is not being used. Ascertain whether your wires are in good condition. Look for places where the insulation may be worn off from friction, where wires rub against the frame or other metal parts of the car. Inspect your lamps to determine whether or not your battery is overloaded. The total candlepower of lamps used should be in proportion to the capacity of the battery and if you are using more than you should, get lamps of the proper candlepower.

All parts of your lighting and starting systems being right, remember that if you operate your car mostly at night, when lights are all on, and very little in daytime, you are not giving your generator opportunity to do its work and a dead battery resulting from this cause shows no fault either in generator or battery. To avoid this condition when car is used mostly at night, economize on your lighting when possible and run your engine awhile each day to fill up the battery.

Last, but not least, don't neglect keeping your battery well filled with distilled water. Remove vent plugs once a week and see whether plates are covered with solution to the depth of at least half an inch. If not, add pure water, never anything else. This is important, as nothing will more certainly insure loss of capacity and final ruin of a storage battery than allowing the plates to become dry.

TESTING LUBRICATING OILS.

Chas. E. Miller Offers Methods Which Owner May Utilize for Himself.

Chas. E. Miller, 97-103 Reade street, New York City, maker of the Pan-American line of lubricants, offers the following simple directions for determining easily the qualities of lubricating oils without chemists' testing apparatus:

Lubricating oils, owing to their present high cost and our wasteful way of using them, like fuel oils and the cost of tires, add largely to the expense of maintaining the modern motor car.

To determine the presence of solid impurities, kerosene is added to half a tumbler of oil until the whole becomes quite thin. The mixture is then passed through filter paper or ordinary white blotting paper, after which the paper is washed with kerosene. The residue, if any, will show if the oil had any solid impurities.

Impurities also may be roughly detected by smearing a piece of writing paper with oil and holding it against the light. If the oil is free from solid impurities the blot will be equally transparent throughout; otherwise, the solid particles will show.

The oil must not resinify. To test it in this respect, pour it into a shallow dish and leave in a warm place about a week. There must not be the slightest crust at the end of that time. Another way to test it is by mixing it with fumes of nitric acid. If the oil is pure, a thick mass will form in a few hours, while resinifying oil will remain thin.

Acids are very injurious impurities in lubricating oil, since in time they attack the machine parts lubricated. To test for them, copper oxide or copper ash is added to the oil in a glass vessel. Acid free oil retains its original color, while if it contains acid, it becomes greenish or bluish.

Digitized by Google

Another test is to drop the oil on a sheet of copper or brass and leave it there for a week. If the oil contains acid there will be a green spot on the metal. Blue litmus paper dipped in acid free oil stays blue, but becomes red if it contains acid.

A good oil must be greasy in order to have good lubricating qualities. To find which of the several oils is best in this respect, place a few drops of each on a smooth, slightly inclined metal or glass sheet. The drop of the best oil will travel furthest in a given time.

MAKING THE CURVES SAFER.

Overland Official Believes Americans Can Profit by Example Set by British.

Recently British motorists instituted a plan for improving driving conditions throughout Great Britain, by removing obstructions at curves and crossings. G. W. Bennett, vice president of the Willys-Overland Company, Toledo, O., comments upon this in the following manner:

The English have shown a commendable spirit of progressiveness in clearing the turns and curves of their roads of objects that prevent a clear view. British motoring publications recently have called attention to the good being done along this line. In two instances I have noted very dangerous curves have been made perfectly safe by cutting down hedges and undergrowth which have prevented a view of the curve. Where heretofore tall hedges, growing inside the curve, have made it impossible to tell what may be approaching from the opposite direction, an unobstructed vision has been obtained merely by eliminating the obstruction. In one case the hedge was cut down and a white painted picket fence, in direct contrast to the surrounding vegetation colors, was built. With these precautions motorists approaching the curve from both directions are enabled to tell at a glance whether the road is clear beyond.

In our own country there are numberless opportunities for this excellent work. Many of our country roads are crossed at various angles by railroads and more often than not it is impossible to tell whether a train or car is approaching because of the growth of brush or other obstructions. In the cities, too, there are scores of dangerous places, where billboards and other unsightly objects are erected close to the crossing or curve. I am confident that in the near future our great automobile clubs will see the need for these preventative measures. And when the work is taken up the number of automobile accidents will greatly decrease.

REGARDING GOOD ROADS.

R. E. Olds Discusses Possibility of Co-Operation in Construction and Maintenance.

The subject of good roads is receiving deserved attention in several parts of the country. Motorists are particularly active and the following suggestions by R. E. Olds, one of the pioneer American automobile manufacturers and designer of the Reo cars, should prove of decided interest:

As road improvement is of nation-wide interest it should be supported by our national, state and county governments. This is notably true with interstate highways, for it is manifestly unjust to tax all the improvement to the abutting land, to the county or even to the state. Why should not our national government promote interstate commerce through good country roads as well as through river and harbor improvements?

Good and patriotic men seem to be at variance as to what is the best system of building roads. Some advocate three or more cross-continent trunk highways to be built and maintained equally by the federal government and by the various states through which the trunk highways go. Others favor the improvement of those roads first which run to the county seat, provided it is a good railroad market town, and if not, to the most accessible large railroad town in the county. They believe that these roads should be properly ditched, graded, rolled and dragged. Culverts should be built where the water is inclined to flow across the road during heavy rains. Grades should be raised in low places, hills materially dug down and good bridges built over creeks and streams of all kinds.

The citizens of a given county could by this plan easily determine on the first 10 miles of good roads to be built and maintained. Then the next five or 10 and so on further away from the principal town or towns in the county until every foot of dirt road in the county is put in first class condition.

The good leaven is working in the minds, hearts and consciences of the American people. Good roads, to them, now mean more than ever before, the avenues which lead to national strength, prosperity and happiness to which every good citizen should be glad to give his due measure of enthusiastic support.

HONEST ADVERTISING LAW.

Republic Rubber Company Heartily Indorses Recent Action of Minnesota Legislature.

In commenting upon the law recently passed by the Minnesota legislature with reference to honest advertising, Web Brown, advertising manager for the Republic Rubber Company, Youngstown, O., maker of Republic tires, has the following to say: "While at first glance this may seem to be radicalism in the extreme, yet a more careful examination will show that the object sought—the protection of the reading public—is one worthy of hearty support. It is an inviolate rule of the Republic Rubber Company that there must be no misrepresentation or exaggeration in Republic advertisements and an examination of these will show that this rule has been followed to the letter. I have no hesitancy in saying that the Republic Rubber Company is in hearty accord with the Minnesota law and all other movements having for their object honest advertising." The law follows:

Any person, firm, corporation or association who, with intent to sell or in any wise dispose of merchandise, securities, service or anything offered directly or indirectly by such person, firm, corporation or association, to the public, for sale or distribution, or with intent to increase the consumption thereof, or induce the public in any manner to enter into any obligation relating thereto, or to acquire title thereto, or any interest therein, makes, publishes, disseminates, circulates, or places before the public, or causes directly or indirectly, to be made, published, disseminated, circulated or placed before the public in this state in a newspaper or other publication or in the form of a book, notice, handbill, poster, bill, label, circular, pamphlet or letter, or in any other way, an advertisement of any sort regarding merchandise, securities, service or anything so offered to the public, which advertisement contains assertion, representation or statement of fact which is untrue, deceptive or misleading, shall be guilty of misdemeanor.

MECHANICAL NOTES FOR OWNERS.

Outlining Methods of Converting Tierods into Adjustable Members---Adjustment and Lubrication of Roller Bearings---Simple Lock Nut Device.

LOST motion in the steering linkage is undesirable and a common source of trouble is wear of the bushings of the tierod yokes and sometimes of the pins themselves. In fitting new bushings the wheels should be tested for alignment and it is possible that a slight alteration of the length of the tierod may need to be made. This is a simple matter if the member is of the adjustable type, but while provision is made in the modern machine, a number of early types have non-adjustable tierods. When these members become bent through accident, etc., it is a troublesome task to align the wheels.

The tierod may be converted into an adjustable member at a slight expense, and at Fig. 1 are

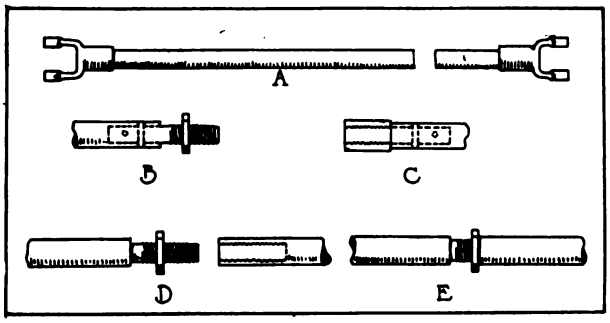

Fig. 1—Converting Tierods into Adjustable Members: A, Where the Cut Should Be Made; B and C, Method Applicable to Tierod Constructed of Tubing; D, Plan for Solid Member; E, Showing Parts Assembled and Locking Nut in Place.

presented two methods of completing the work. A is a tierod constructed of tubing which is cut near the yoke to permit of incorporating the parts B and C. The former is prepared by taking a round piece of steel and making a driving fit into the tubing, after which the piece is pinned and brazed, also threaded and a nut fitted. At C is shown the other section of the rod and it will be noted that the inserted member is slightly larger and that it is tapped to take the screw bolt. With this construction it is a simple matter to lengthen or shorten the tierod by removing one yoke end from the knuckle and screwing the yoke section in or out as desired, after which the lock nut is set up hard.

If the tierod be solid the plan at D may be utilized. The rod is cut and one end is tapped as indicated in the drawing, while the other end is turned down and threaded to fit the first part. The assembly of the rod is shown at E. It will not be necessary to cut a very long thread for adjustment as a slight increase or decrease of length will be sufficient to secure the desired alignment.

A SIMPLE LOCK NUT DEVICE.

Some components of the motor car are subject to considerable vibration and unless the nuts are locked securely it is difficult to keep the parts properly adjusted. At Fig. 3 D is a simple and easily constructed locking device utilized by the writer on a planetary transmission and where the studs holding the drive shaft to the transmission casing repeatedly loosened, although the conventional lock washers were employed.

The casing and drive shaft with one of the screw bolts are shown at C and as the end of the shaft is carried in a bearing it is essential that the plate be locked securely to the housing to preserve alignment. The locking device is illustrated at D. It is made by taking a piece of flexible sheet metal and cutting it out to the shape shown. It should be made sufficiently wide to permit of cutting out the opening for the bolt and without weakening the metal. The length should permit bending of the long ends over the top of the casing or part, also over the nut. The bolt is then slipped through the opening and attached in place, after which it is set up hard and the ends of the locking device bent over as shown at E. The parts assembled are illustrated at C. This kink may be adapted to a number of places where the nuts or bolts have a tendency to work loose. It will also save an inspection from time to time and will be of service where the parts are not easily accessible.

SAVING ASBESTOS GASKETS.

Plain asbestos gaskets are essential on some motors because of the need of varying thickness to compensate for the cylinders being slightly out of line or the exhaust manifold uneven or warped. In displacing the gaskets they are usually spoiled and new ones must be fitted. If the parts are out of line, and considerable trouble

Digitized by Google

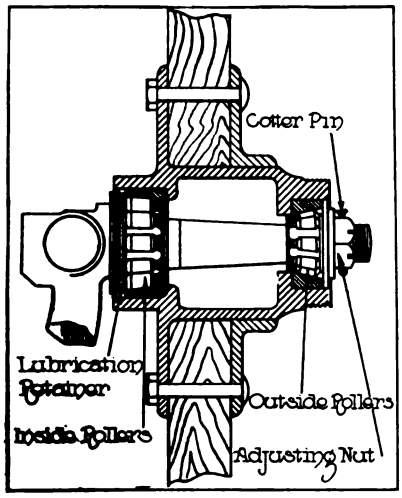

Fig. 2—Adjusting Mechanism of Roller Bearings.

is experienced in making the joint, the asbestos is apt to become broken up.

At Fig. 3 B is illustrated a gasket made of brass wire gauze and by making two of these it is a simple matter to protect the asbestos. The wire gaskets may be cut out in the usual manner by placing the gauze over the parts and tapping the openings with a ball pein hammer. The gasket should be made slightly large so that its ends may be turned over to retain the asbestos. By coating the gauze with graphite the gasket may be displaced easily and utilized a number of times.

REMOVING BROKEN STUDS.

Various methods may be employed to remove or replace a stud. Sometimes in the overhaul of the power plant a stud will be unscrewed from the crankcase because the nut has been set up too snugly or because the nut is frozen. It is poor policy to utilize a cold chisel or a Stillson, as the threads of the bolt will be ruined. By screwing down a nut, then locking a second one, as shown at Fig. 3 A, the stud may be removed or replaced, using the wrench on the lower and upper nut respectively.

ADJUSTING ROLLER BEARINGS.

Roller bearings are fitted to the front wheels on several makes of cars and while the average motorist understands the adjustment of bearings of the ball type he is apt to apply the same methods when eliminating play from the roller members. The construction of the latter, such as are utilized on the Overland machines for example, is shown in an accompanying illustration with the parts clearly marked.

To ascertain if the bearings require adjusting, jack up the front wheels and rock them sideways, taking care not to confound wear of the spindle with that of the rollers, etc. If the wheels are loose, remove the hub cap and clean the grease from the locking nut so that the cotter pin may be removed easily. The pin should be so displaced that it can be utilized.

To tighten the bearing, rotate the wheel, and at the same time screw down the notched adjusting nut until the bearing is sufficiently snug to stop the movement of the wheel. Next slack off the nut, but only enough to allow the wheel to spin. Lock and replace cotter pin. It is better to have the bearing slightly loose than too tight as the rollers may be injured. Repack with graphite grease and refill hub cap with the same lubricant. Do not use so much grease in the cap as to prevent its being screwed up home, as loss of the cap will be apt to follow.

RACING THE MOTOR.

It is noticeable that a large number of drivers race their engines to warm them up after starting on a cold day. This is poor practise and considerable damage results. When a motor is raced it attains a speed greatly in excess of that for which it was designed and the working parts are subjected to a considerable strain that is uncalled for. The valve mechanism is called upon to operate at a speed in excess of normal and the constant hammering of the parts is likely to cause breakage of the hardened parts—the cam and roller for example. If the motor must be warmed, allow it to rotate at a reasonable speed, but don't race it.

In moving the car by hand it is poor practise to utilize the steering wheel entirely, as its components are likely to be strained.

IN THE COMMERCIAL VEHICLE FIELD.

Constructional Details of New Buick Delivery Wagon, Seven-Ton Vulcan and Worm Driven Blair—Manufacturers' Census Shows 50,000 Trucks.

THE Buick Motor Company, Flint, Mich., is presenting this season a new delivery model, in which the chassis has been specially designed for the work it is called upon to perform. Two sizes are offered, that known as No. 3 being with 100-inch wheelbase and with carrying capacity of 1000 pounds, and the No. 4 having wheelbase of 122 inches and capable of handling loads of 1500 pounds. Various types of bodies are provided to meet the requirements of the individual purchaser.

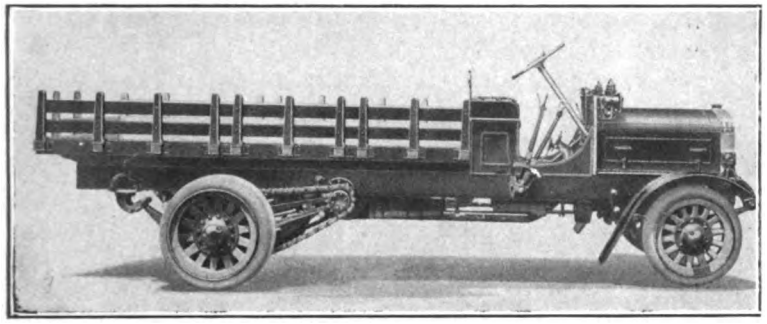
The motor has four vertical cylinders cast en bloc and is of the L head type. The cylinders have a bore of three inches and stroke of five, giving a bore to stroke ratio of 1:1.66, and while the horsepower rating under the S. A. E. formula

New Buick 1500-Pound Delivery Wagon.

is but 14.4, it is maintained that the long stroke enables the motor to exceed this very materially. All valves are enclosed, making for a quietly operating motor, as well as protecting them from foreign elements. The crankshaft is extra heavy and has three bearings. The engine is fitted with a simple detachable head and the intake manifold passes through the water jacket, thus providing for heating the mixture before it reaches the cylinders. Cooling is by the thermo-syphon system. The radiator is of the vertical tube type and is assisted in its operation by a belt driven fan. Oil is circulated by a gear driven pump, with a constant level for splash lubrication, a sight feed being located on the dash. Ignition is by magneto with a set of dry cells as reserve. An adjustable sealed governor controls the speed of the motor to a predetermined maximum.

A feature of the construction is the mounting of the engine and transmission on a subframe, making possible the removal of either separately or as a unit by withdrawing four bolts. The clutch is of the cone type, faced with leather. The transmission is selective, giving three speeds forward and reverse, with direct drive on the third speed. Final drive is by shaft to the three-quarters floating rear axle mounted on Hyatt roller bearings. The driving shaft is enclosed in a large torque tube, the forward end of which is supported by a large yoke coupled to the centre cross frame member. Stout radius rods from the rear axle to the yoke maintain the relation of the former.

The frame is of pressed steel of rugged construction, and is strongly braced and reinforced with gusset plates where necessary. The front springs are semi-elliptic and the rear full elliptic. Two sets of brakes are provided, the foot or service member being of the external contracting type and the hand or emergency, internal expanding. Both sets operate on the rear wheel drums. The driver is located at the left with centre control.



The standard body designs include: Flare board express, panel side closed door, wire screen and side and stake. Both sizes are fitted with pneumatic tires, the larger utilizing 34 by five-inch shoes and the smaller 34 by 4.5. The body length of the No. 3 is 60 inches back of the driver's seat, while on No. 4 it may be 90 to 96 inches. The speed is from 18 to 25 miles an hour, dependent upon road conditions and the service demanded.

SEVEN-TON VULCAN TRUCK.

One of Several Models Introduced by Well Known Automobile Parts Maker.

One of the largest commercial motor vehicles thus far produced in this country is the seven-ton Vulcan, made by the Driggs-Seabury Ordnance Corporation, Sharon, Penn. This concern also manufactures wagons of three, four, 4.5, five and

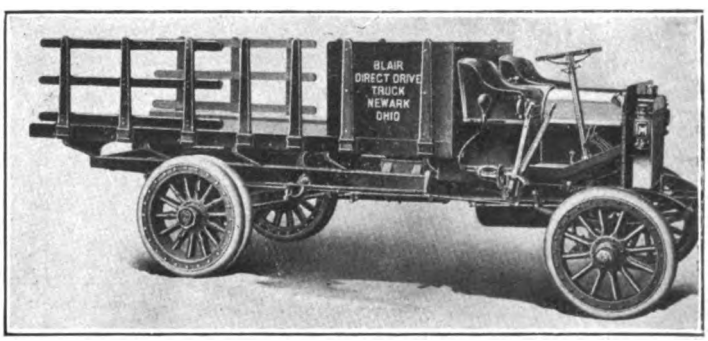
Digitized by Google

Seven-Ton Vulcan, Produced by Driggs-Seabury Ordnance Corporation.

six tons capacity, and it is understood that it is planned to add machines of one and two tons. This policy has been decided upon in order that the purchaser may make such selection as will best meet his needs. The reputation of the Driggs-Seabury company in the automobile parts field for a number of years is such as to insure that it has the equipment and facilities to produce trucks of the highest standard.

The design of the seven-ton Vulcan has been very carefully thought out and it presents very large factors of safety. The motor is a four-cylinder, water-cooled unit of the L head type, with cylinders cast in pairs. The bore is 4.75 inches and the stroke 5.5, giving a rating under the S. A. E. formula of 36.1 horsepower. The crankshaft is mounted on three annular ball bearings. The cooling system has a capacity of 18 gallons, the circulation being by centrifugal pump. The radiator may be either a tubular or a cellular member mounted on trunnions on the chassis frame, and cooling is further aided by a belt driven fan. The lubrication is by a combination of force feed, utilizing a gear driven pump, and splash. Ignition is by Bosch dual system, using magneto and battery. The carburetor is of the automatic float feed type.

The clutch is a leather faced cone member, and the transmission is assembled as a unit with the jackshaft, being contained in a case carried on three points of support on two frame cross members. The gearset affords four forward speeds and reverse, and the large shafts and gears are mounted on annular ball bearings. The differential is fitted with a lock. The drive from the jackshaft to the rear wheels is by side chains. The service brake operates on the jackshaft and the emergency on the rear wheels.



The frame is a steel channel section nine inches in width and 2.5 inches in depth, and is mounted on semi-elliptic springs 48 inches long in front and 55 in the rear, the latter being underslung and having 22 leaves. The forward axle is a drop forged alloy steel I section, and the rear a nickel steel drop forging. The wheels are 36 inches in diameter, fitted with seven-inch tires in front and six-inch dual members at the rear. The wheelbase is 156 inches and the tread 60 inches forward and 70 inches rear. The driver is located at the right and the steering gear is of the irreversible worm type. The chassis weight is 8000 pounds and its length 240 inches, 146.75 back of driver's seat.

THE WORM DRIVEN BLAIR.

Feature of the Design Is Found in the Use of Full Length Sub-Frame.

It recently was announced that the Blair Manufacturing Company, Newark, O., maker of the Blair worm driven models, was about to produce a five-ton machine, supplementing the 1.5, 2.5 and 3.5-ton vehicles previously presented and to follow the same general design. Not only is the Blair a worm driven machine, but it possesses another interesting feature in the use of a sub-frame of heavy channel steel extending the full length between the two axles.

This sub-frame is held to provide a three point suspension and to carry the weight of the power plant only. It is hinged to the main frame in front by means of steel castings and heavy hardened and ground steel hinge pins. It is cambered or "necked" at the rear, back of a large cross frame member, and this portion is hinged at right angles to the rear axle housing, extending across it. The two side members of the subframe at this point carry collars which support it on a heavy sleeve, containing the worm, and which are free to turn, although they have no

Blair Worm Driven Chassis with Stake Platform Body.

Digitized by Google

longitudinal motion. Radius rods extend from the ends of the rear axle housing to the centre cross members of the sub-frame, and the tractive effort is transmitted through the sub-frame from the rear axle to the front cross member of the chassis main frame.

The motors are of the four-cylinder, water-cooled, L head type, with long stroke, large bearings and enclosed mechanism, fitted with governors and utilizing dual Bosch ignition. With each the motor is mounted with the cone clutch in the sub-frame, while the transmission is carried in a heavy case suspended between the sub-frame side members. There is a universal joint between the clutch and gearset and another in the shaft back of the central cross member. The transmission is selective, giving three forward speeds and reverse, the gears always being in mesh and idle only on the direct drive.

The rear axle is of the full floating type with a heavy housing. The main chassis frame is suspended on a platform of springs. It is maintained that no matter what the position of the axle through variance of road surface no excess stress is brought upon the frame or the power plant and the system of transmission, and that there is always the same position of the shaft with relation to the motor and gearset. Both brakes act on drums on the rear wheels. The seats are arranged on either side of the motor.

MAKERS' CENSUS OF TRUCK INDUSTRY.

AS THE result of a census of the industry taken by the commercial vehicle committee of the National Association of Automobile Manufacturers, that body has issued a statement that at least 50,420 machines of this type had been produced prior to 1913. An estimate of the product for the current year is placed at 56,744. In this connection it is of interest to note that the reports of registrations in the various states secured by The Automobile Journal early in the present year indicated that there were in use in the country, 50,000 commercial motor vehicles.

The committee sought information from 280 makers of gasoline machines and 32 electric vehicle producers, and reports were received from 170. It has been assumed by the committee that the remainder either were not very active or important. Eighty-five concerns made report in 1912. As a result of its knowledge of conditions, the committee feels justified in adding 25 per cent. to the figures as received prior to 1912, and 10 per cent. to those for 1912, and to the estimates for 1913, in order to allow for the machines manufactured by the concerns who failed to make report. The figures are tabulated as follows:

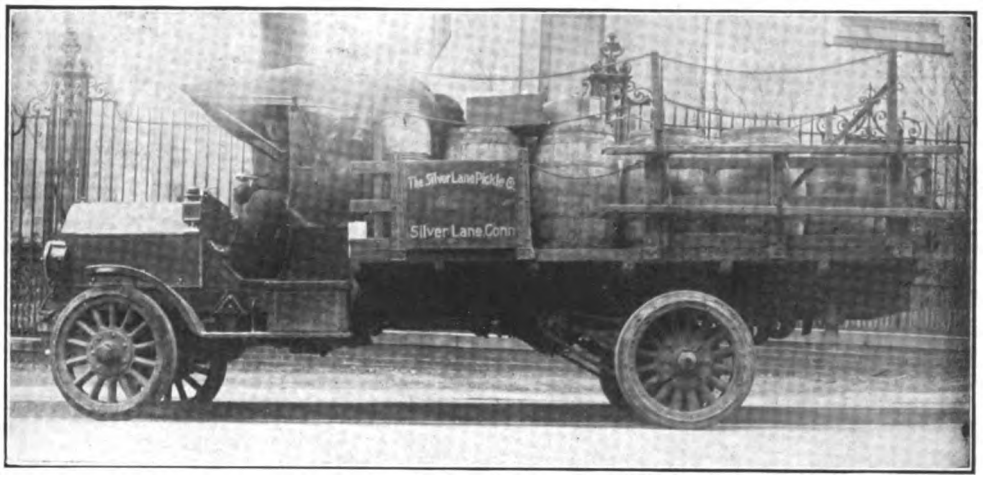
Reported output prior to 1911	10,374 + 25%	= 12,968
Reported output during 1911	10,655 + 25%	= 13,319
Reported output during 1912	21,939 + 10%	= 24,133
Totals	42,968	50,420
Estimated output for 1913	51,586 + 10%	= 56,744

Analysis of the reports shows that the largest and most rapid increases in numbers have been made in the 1000, 1500, 3000, 4000, 6000 and 10,000-pound gasoline machines, and in the 1000, 2000, 4000 and 7000-pound electrics. Taking into account only the companies making full reports for both years, 1912 and 1913, it is found that 35 models have been dropped by the gasoline makers and 44 new models added, while the electric producers have dropped 12 models and added five. The mean average price of all the commercial vehicles produced in 1912 was $1957.37; that of gasoline cars $1868.95, and of the electrics, $2465.18. In 1911 the average value of all gasoline trucks sold appeared from the records to be $2079.16, and for all preceding years combined, it was $1955.70; while in 1911 the average price of all electrics was $2759.66, and for all preceding years, $3369.72.

The reports of the 170 companies received in February and March, 1913, are tabulated:

	1912		1913	
	No. Cars	Aggregate Value	No. Cars	Aggregate Value
Gasoline vehicles	20,052	$37,474,308	44,245	$83,073,200
Same, value estimated*	100	162,357	1,775	2,620,847
Fire apparatus	140	843,900	232	1,422,250
Same, value estimated*	135	813,760	260	1,595,200
Gasoline tricars	58	23,610	1,500	662,500
Gasoline tractors	42	122,500	800	2,125,000
Electric vehicles	1,351	3,330,568	2,736	6,627,750
Mixed systems	59	163,800	25	108,125
Steam vehicles	2	8,025	13	54,000
Grand totals	21,939	$42,942,828	51,586	$98,288,872

*Production reported with no values given; values calculated on average prices of other vehicles of same kind and capacity.



Shortly before the tornado in Omaha and the floods in Ohio and Indiana, a severe sleet storm in Chicago and vicinity necessitated the use of some 400,000 pounds of hard drawn copper wire and much line hardware for the telephone and telegraph lines in that section. This was supplied by the Western Electric Company, motor trucks being used to great advantage in hauling the material in quick time.

Digitized by Google

TRUCK COMPETES WITH RAILROAD SERVICE.

AN INSTANCE of competing with steam or electric railroad service, in which the motor truck is able to present decided economy and efficiency, is noted in the experience of the Silver Lane Pickle Company, Silver Lane, Conn. The machine is a three-ton KisselKar, made by the Kissel Motor Car Company, Hartford, Wis., and has been in service since April, 1912.

The factory of the concern is between four and five miles from Hartford, and from this point distribution is made. The vegetables from which the pickles are manufactured are grown on the farms in Vernon and Rockville, and are hauled to the plant by the company. The business has extended until it includes customers in many of the cities and towns of Connecticut and Massachusetts, and barrels formerly were taken from the factory to the trolley or railroad freight stations. Under this arrangement the shipments were double tagged and on their arrival at their destination it was necessary for local expressmen to deliver, collect the empty containers, bring them to the freight station and reship them to the company.

KisselKar Three-Ton Truck Utilized in Delivery System of Silver Lane Pickle Company.

Under the new plan the truck is utilized in making deliveries up and down the Connecticut valley as far as Northampton, Mass., on the north, a distance of about 50 miles, and to New Haven and Bridgeport on the south. The run to Bridgeport is the longest thus far attempted, and while the round trip covers some 108 miles, the incidental deliveries and collections will bring this approximately to 120. It has been found that the run to Northampton or Bridgeport and return can be made in a single day.

More than 10,000,000 pickles were made by the company during 1912. After the purchase of the KisselKar it was used to haul the vegetables, as well as deliver the orders. It was used practically 24 hours a day in the harvest season, two crews manning it. The approximate cost of operation is $12.50 a day, as indicated by the following estimate for the year, the figures bei based upon the actual expense for a given peri·

Fuel, lubricants, etc.	$60(
Repairs, 10 per cent.	340.(
Tires, 10,000 miles guaranteed.	250.0(
Wages, driver and helper.	1456.00
Depreciation, 20 per cent.	680.00
Interest, 5 per cent.	170.00
Insurance and taxes.	199.00
Total.	$3695.00
Daily cost, 300 working days.	$12.32

To understand the value of direct delivery it is only necessary to state that with the railroad service delays not only were frequent, but at times were of extreme length. An instance that well illustrates this condition occurred when a shipment of sauer krout was sent by freight from Hartford to Rockville, a distance of 14 miles, because the truck was not that day available for the delivery. Eight days later the salesman called on the Rockville customer just as the expressman drove up with the order, which could have been sent out by the machine in less than two hours.

The company does a large business with firms in Worcester, Mass., and for the coming year it is intended to send the machine to that city, a distance of 90 miles. This will be made a two-day trip, and the Bridgeport route also will be covered in two days, because long drives mean hard work for the crew. Wherever the business will justify and within a radius of 100 miles the truck will be used for delivery and collection. Experience of the company has been such as to indicate in a thorough manner the wisdom of this decision.

MOTORING LAWS AND THEIR ENFORCEMENT.

New Jersey's Motor Vehicle Commissioner Has Plan for Scientific Interstate License System---What Various State Legislatures Are Doing.

INASMUCH as New Jersey has occupied a position of prominence in the matter of automobile legislation, motorists undoubtedly will be interested in the opinion of Job H. Lippincott, state commissioner of motor vehicles, who believes that he has a plan for an interstate license system which will solve the problem of interstate touring and its application to the maintenance of state roads. Mr. Lippincott has outlined his position in Suburban Life of New York City in part as follows:

The relation of the state toward automobile regulation has been neither well defined nor reasonable. A strange lack of scientific treatment has been apparent, with the result that motor vehicle laws generally are little better than a series of expediency rules and class legislation. The causes which have brought about this condition are partly political and partly due to the modernity of the subject.

In each state the automobile has engendered a class and sectional feeling, both of which are just disappearing. The farmer has opposed the automobile and the man of the city has favored it, thus creating a legislative situation which has caused motor vehicle laws to be a patchwork of concessions and compromises. Motor vehicles have now so rapidly increased in number, and have recently been placed to such diversified uses that all opposition is disappearing, thus making it possible for state governments to adopt a proper and reasonable method of licensing and regulating.

Motor vehicles, to a greater degree than any other class of road vehicles, are interstate in their use; yet, under our laws, the licensing power, and thereby much of the power to regulate, rests in the state in which the owner is resident. The great number of business and pleasure machines passing from one state to another has raised questions of a very grave nature concerning the relations which the several states should bear toward machines licensed by a sister state. The result has been a system of retaliatory laws, euphoniously called reciprocity; or, to be specific, an exchange of privilege without an exchange of regulation or revenue.

As the sole possible basis for licensing cars and drivers is, first, to obtain revenue for the building and the repairing of the roads necessary to motor vehicle travel, and second, by revoking the license to provide a summary method of dealing with those abusing the privilege, it is difficult to understand why the states have drifted so far from the fundamental principles. The present laws, allowing free passage of machines from one state to another, disregard both of the above fundamentals.

The increased use of our roads for motor vehicle travel, and the increased difficulty of maintenance and added expense of road building, make it necessary that every machine using the roads of any state bear a just share of the cost of construction and maintenance. On this generalization a system should be constructed that will automatically meet the foregoing requirements.

Reciprocity, as now established, is a failure. It provides for privilege without regulation; it increases expenses and decreases revenues. Its provision for a set number of days of free touring is practically unenforcible without a vast and expensive machinery of inspection. Its authors never intended that it should be enforced, and framed it for that purpose. Under it the road systems of states like New Jersey and Connecticut are fast approaching ruin, without the necessary money to reconstruct. It has benefited no state, and it has injured all. Yet the nature of the motor vehicle travel demands that the motorist, whether for business or pleasure, be not subjected to constant annoyance and inconvenience, by being compelled to conform to repeated registration.

The system, therefore, which should be evolved must be automatic, both as to regulation and revenue; entailing only one registration, and granting sufficient privilege to make interstate travel possible without annoyance or delays. The suggestion which is recommended for discussion is an interstate license system. In the elaboration of the interstate license the following fundamentals are suggested as a basis for the drafting of a model license law:

1—Establish an interstate license to be issued by the motor vehicle department of the state in which the owner of the vehicle so licensed is resident.

2—Have the registration tags used on cars bearing such license, through color scheme, numbers, series, initials or otherwise, indicate the states in which such privilege is granted.

3—Charge for such license on the basis of horsepower. Appropriate such fee to the use of the state in which the owner is resident, and charge an additional fee computed on a percentage of the regular fee for each additional state to which the license privilege is extended.

4—The department granting such interstate license would then notify the departments of all the states comprised in such privilege, giving character of the registration tag issued, and forwarding a check for such additional fee charged on a per state basis.

5—The department of any state comprised in such interstate license to have the power to revoke, cancel or suspend such license, insofar as it extended to the state taking such action.

6—The revenue so derived from such license to go into the general motor vehicle fund of each state, and to be used by such state for the repair of the roads.

ZONE RECIPROCITY SYSTEM.

New Hampshire Legislators Working Out New Plan for Border Owners.

Several amendments to the motoring law in New Hampshire are under consideration by the present legislature. These include a new schedule of registration fees for "non-passenger carrying" motor vehicles, which may be interpreted to mean motor trucks, as follows: Not over one ton, $10; one to two tons, $12.50; two to five, $15; more than five, $20. Machines used solely for hire are to be registered at a flat rate of $10. Motorcycles are to be permitted to utilize an attachment bearing an additional wheel.

The chief item of interest is a new reciprocity provision for residents of border states, which has been styled a zone system. The wording of the amendment is given below, and it may be added that the fee is placed at $2:

A motor vehicle owned by a non-resident of this state who has complied with the laws of his state relating to registration and licensing of motor vehicles, who has a bona fide actual residence in a state granting like privileges to residents of this state, which residence is located within 15 miles by highway of the border line of

Digitized by Google

this state, may be operated upon the ways of this state distant not more than 15 miles from the border line of his state, if application for the registration thereof is made in accordance with the provisions of section 2 and the proper fee, provided for in section 26, is paid, and the said motor vehicle is duty registered by the secretary or his authorized agent.

FIFTY CENTS A HORSEPOWER.

New Michigan Law Takes Automobiles from Jurisdiction of Local Tax Officers.

Under the old motoring law in Michigan a registration fee of $3 was required, but automobiles were subject to local taxation. The Senate has passed the Allswede bill, which takes the cars from the jurisdiction of the local taxation officers and imposes a state tax of 50 cents a horsepower, the money thus raised going to the state highway fund.

It is estimated that the income from this source will net between $600,000 and $800,000. Some objection to the bill has developed in certain quarters because it has been figured out that a $3000 car of 40 horsepower would bring an average of $60 in taxes, but only $20 under the proposed law. Good roads enthusiasts are particularly anxious that the bill shall be enacted and receive the governor's signature.

NEW INDIANA LAW.

Motorists of Hoosier State No Longer Able to Register at Nominal Fee.

After July 1 owners of automobiles in Indiana will be compelled to pay an annual registration fee of from $5 to $20, instead of being able to secure a perpetual registration at a cost of $1. A chauffeur will be required to pay $2 a year after passing examination. Cities are not permitted to exact a local fee. The schedule for vehicles is as follows:

Motorcycles, $2; automobiles of 25 horsepower or less, $5; 25-40, $8; 40-50, $15; over 50, $20; electric machines, $3; commercial vehicles, $5; manufacturers and dealers, $25, and $1 for each duplicate marker. It is anticipated that a good roads fund amounting to several thousand dollars will result.

TO AID GARAGE KEEPERS.

Senator Bailey of Maine Legislature Explains Need for His Measure.

The bill introduced in the legislature of Maine by Senator Bailey, seeking to protect garage owners, failed to pass both branches and has gone into conference. The text of the bill is as follows:

Whoever puts an automobile in a public garage or any other place where automobiles are stored for hire, and without having an express agreement for credit, procures supplies, accessories or accommodation for himself or said automobile, and with intent to defraud the owner or keeper of said garage, removes or causes to be removed any such automobile from such garage without paying the proper charges due for repairs, supplies, accessories and accommodations furnished thereon, shall be punished by imprisonment not exceeding three months or by a fine not exceeding $100.

In explaining the need for this legislation Senator Bailey cited the fact that the courts of this country have held that a public automobile garage is practically in the same position as a public inn keeper, and must receive any person who comes there with his automobile for accommodation. The supreme court of Michigan has expressly stated that this is the law. Senator Bailey holds that with the increasing number of motoring tourists it has become necessary to afford the garage keeper protection in this respect.

LEGISLATIVE BRIEFS.

Motorists in Illinois are seeking the passage of an act prohibiting local ordinances respecting the speed of automobiles, and the examination and licensing of chauffeurs.

One of the bills enacted by the Missouri legislature at its recent session was that making it a felony to take, use or tamper with a motor vehicle without the consent of the owner.

Delaware has joined New York in authorizing the governor to appoint a commission to confer with similar commissions from other states in the matter of securing uniform motoring laws.

The circuit court in Jackson, Miss., has decided that the Mississippi motoring law, requiring registration of automobiles, is constitutional. The action was brought against H. C. Lawrence, and is in the nature of a test case. The matter has now been appealed to the supreme court.

The Massachusetts senate has killed the bill to provide that in collection of automobile damages proof that the injury was done by a particular car should be evidence that the machine was being operated by the owner or his servant. This provision appears to be similar to that which recently was declared unconstitutional by the Michigan supreme court.

Amendments to the motoring law in New Jersey, passed recently, include the following provisions: All rear lights shall shine on the rear number plates so that the number may be visible for at least 50 feet, identification markers shall be placed so as not to swing, and motor vehicles bearing licenses of other states which violate the law in New Jersey may have the reciprocity privilege suspended against them and they are not to be permitted to enter the state again.

After a failure to secure reciprocity with Maryland, the commissioners of the District of Columbia recently promulgated a rule that non-residents should be compelled to pay the same registration fee that their home states charged against residents of the District of Columbia. It was not discovered until later that this rule would act against all members of Congress and officers of the federal government, who are of course legally residents of the states they represent. An amendment has been passed construing these persons as residents for the purpose of securing automobile licenses, the fee for which is $2.

FRENCH MOTOR STARTS COLD ON KEROSENE.

M. BELLEM, a French engineer, has produced a four-cycle motor, which is claimed to operate equally well on kerosene or crude oil and to start as easily on heavy fuels when cold as does the conventional engine utilizing gasoline. It weighs approximately the same as the ordinary automobile motor and a feature of the invention is that it may be applied to the standard designs; in fact, most of the experimental work has been accomplished on converted units.

The usual carburetor or vaporizer is dispensed with, the fuel being pulverized by being injected into a vacuum formed by allowing the intake valve to open only after the piston has completed a certain portion of the suction stroke,

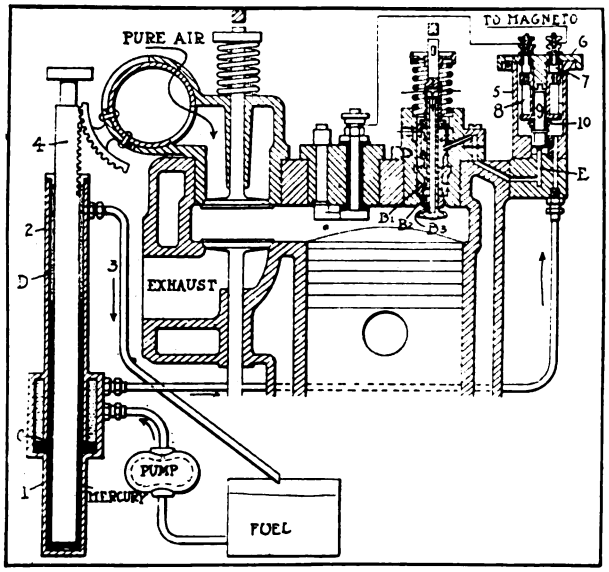

Fig. 1—General Plan of Bellem Heavy Fuel Motor, Utilizing Distributor and Magnetic Coil—The Feature of the Invention Is Pulverization of the Fuel by Injecting It into Vacuum.

and instead of admitting a mixture, pure air is allowed to flow through. The valve does not open until 30 degrees before lower dead centre and it closes about 30 degrees after lower dead centre. Both the intake and exhaust valves are mechanically operated, the latter having the usual timing.

The intake valve mechanism comprises two principal parts, a pressure regulator and a distributor. The pressure is controlled through varying the height of a column of mercury and the amount of pressure utilized does not affect the quantity of fuel. The distributor, the opening of which is independent of motor speeds, is controlled by a magnetic coil, current to which is supplied by a low-tension magneto. This electrical control renders the opening of the distributor dependent on the weight of a needle valve and the strength of a spring.

The intake valve is of the automatic type and is in combination with the pulverizer. With the main valves closed there is considerable depression in the cylinder during the first part of the intake or suction stroke. The automatic valve shown in detail at Fig. 2 B is opened by the suction of the piston. The charge of fuel is brought up to the valve under pressure. At the same time a certain amount of air and the liquid are brought in from A and B, through the openings B 1 and B 2 respectively. Pure air is then drawn through the stem of the valve, which is hollow, and holes B 3, completely pulverizing the fuel.

The delivery of the fuel under pressure is accomplished by the utilization of the pressure regulator and the distributor. The former is illustrated at Fig. 3, and is supplied from the tank by a pump. It comprises a metal vessel 1, containing mercury, and welded to it, a metal tube the lower end of which is level with the top of the mercury. Located in the tube is a plunger 4, capable of being raised and lowered in any convenient manner, and, according to its position it varies the height of the column of mercury d in the tube 2. The pressure of the fuel in the chamber c is regulated by the column of mercury.

The overflow or excess of fuel passes through the mercury column and down an overflow pipe 3 to the tank. The feed pump has a capacity slightly greater than that of the motor under full power. The quantity of fuel flowing through the return pipe is negligible and no mercury is carried through with the fuel. The plunger is connected to the air valve, and a single operation, controlled either by a governor or by hand, determines the pressure of the fuel to the distributor and the amount of air admitted to the motor.

A feed pipe connects the pressure chamber with the distributor at the right of the automatic valve. As the pressure is variable the distributor is not called upon to regulate the quantity of fuel as its opening must be constant and independent of motor speed. An aperture which would permit of the passage of the proper amount of fuel at 1000 revolutions a minute would be too large at 500 or less if a mechanical control were utilized. There would also be a possibility of the

Digitized by Google

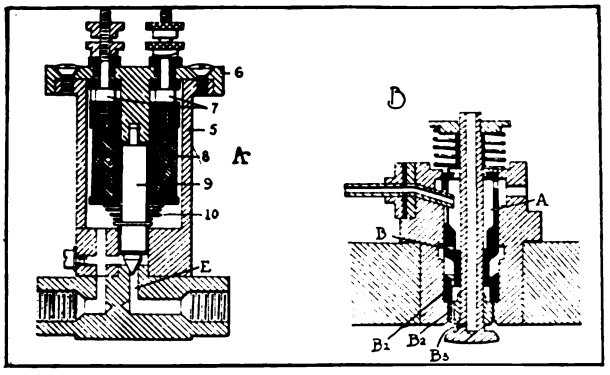

Fig. 2—Details of the Bellem Motor: A, Magnetic Control, Current to Which Is Supplied by Low-Tension Magneto; B, Automatic Valve and Ports for Fuel and Air.

engine stopping with the valve open if a mechanical member were employed and the fluid would continue to flow until the pressure fell.

As previously mentioned the control is magnetic and the device shown at Fig. 2 A comprises a soft iron core 5, with a cover 6, to which is secured the coil 8, by means of insulated terminals 7. In the centre of the coil is a needle valve 9, which is held on its seat by a coil spring 10. At the instant of breaking contact on a low-tension magneto the needle valve is raised from its seat and the fuel under pressure in the feed pipe passes through E to the pulverizer. The opening of the valve is practically instantaneous and depends on the weight of the needle valve and tension of the spring. The length of the opening is obviously constant, whatever the speed of the motor.

The models employed in experimental work were equipped with an ordinary type of high-tension magneto and a low-tension instrument was utilized for supplying current to the magnetic distributor. The strokes of the motor are the same as with the conventional engine and those converted have generally been between 60 and 70 pounds a square inch.

Strong claims are made for the pulverizer, and in a recent test a single-cylinder demonstrating model was cranked with the ignition cut off and the engine cold. Tests made of the exhaust showed that the vapor contained no traces of condensation. The inventor claims he obtains cold vapors. Among the tests to which the motor was subjected was that of supplying the circulation system with cold water from the city mains and after the power plant had stood over night. It started on the quarter-turn and the test was repeated several times with intervals between the starts and after flooding the water jackets with cold water.

A single-cylinder Bellem motor, having a 3.9-inch bore and 5.9-inch stroke, compression 71 pounds to the square inch, was tested at the laboratory of the Automobile Club of France. The engine was started cold on kerosene and the first test lasted two hours. The second was on alcohol and the third on crude oil. The last named tests were of one hour each. The acceleration from 183 revolutions a minute to maximum speed under load was particularly easy. The rotative speed with kerosene was from 811 to 820 revolutions a minute and the effective horsepower was from 4.9 to 5.1 with a fuel consumption of 1.42 gallons a horsepower-hour. The specific consumption of kerosene, gallons an hour, was .142.

With alcohol the motor was run at 773 revolutions a minute, developing 5.1 horsepower, and the fuel consumption an hour was 1.2, gallons a horsepower-hour .214. A lower rotative speed was observed with crude oil, 760 revolutions a minute and the effective horsepower was 4.25, consumption gallons an hour .396 and specific consumption gallons a horsepower .920. The Bellem motor is adapted to marine, stationary or automobile use and as previously pointed out the invention can be applied to conventional motors. It is claimed that licenses to construct it have been secured by Delaunay-Belleville, and by Sautter & Harle, a French firm that is employed largely on the work for the army and navy.

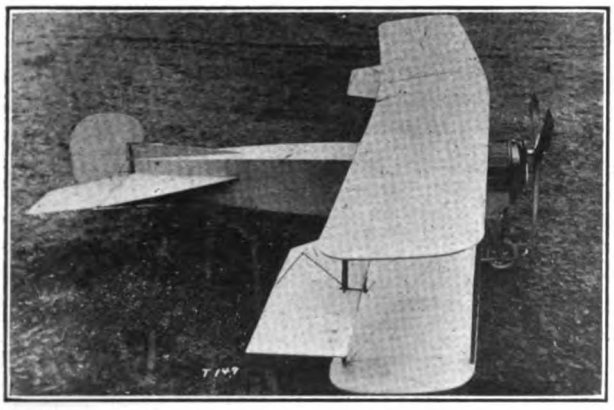
CURTISS MILITARY TRACTOR BIPLANE.

HEREWITH are presented illustrations of the new Curtiss military tractor biplane, which differs in many respects from the standard Curtiss machine. The installation of the engine, radiator and screw at the front would be sufficient to change the appearance of the assembly very materially, but it will be noted that the screw is three-bladed instead of two, the fuselage has been entirely enclosed and the main plane formation has been arranged so as to be folded against the side for easy transportation over the road. The empennage follows closely that adopted for the Curtiss flying boat, described in detail in a recent issue.

The wings are made in one piece on either side of the chassis. The beams are very strong, heavy at the inner end and tapering all the way to the tip, calculated to give maximum strength proportioned to the load at each point and at the same time to reduce the weight. The chassis is but 42 inches wide, and when the wings are removed and folded along the side the overall width is about 65 inches. With a tread of 56 inches it readily may be seen that the chassis accommodates itself conveniently to the standard highway.

The fuselage is constructed of four members of white spruce, tapered from the rear beam to the extreme end. A new system of wiring and bracing is used, this requiring no holes through the corner members, so that a lighter piece may be utilized and the same strength secured as with a larger one fastened in the ordinary manner. The tail surfaces and elevators, with demountable stabilizers and vertical fins, are easily detachable for packing. The entire fuselage is covered to reduce head resistance, and the seats are placed side by side. In order that a good downward angle of vision may be obtained, a space of 12 inches is left alongside the fuselage, out to the first rib on either side.



The engine is located directly in front of the operators and the carburetor projects through the dash into the cockpit, where it may be adjusted by either occupant and where it is at all times under observation. The gasoline tank is located under the seats and has a capacity of 40 gallons. A two-gallon auxiliary tank on the dash is kept supplied from the main tank by a pump operated by the motor. A plate glass window in the auxiliary tank answers two purposes: The level of the supply may be noted and also the stream of gasoline coming from the main tank. If for any reason the pump should stop working, it is only necessary to throw over a small lever, controlling a distributing valve, and a few strokes of a hand pump will restore the level.

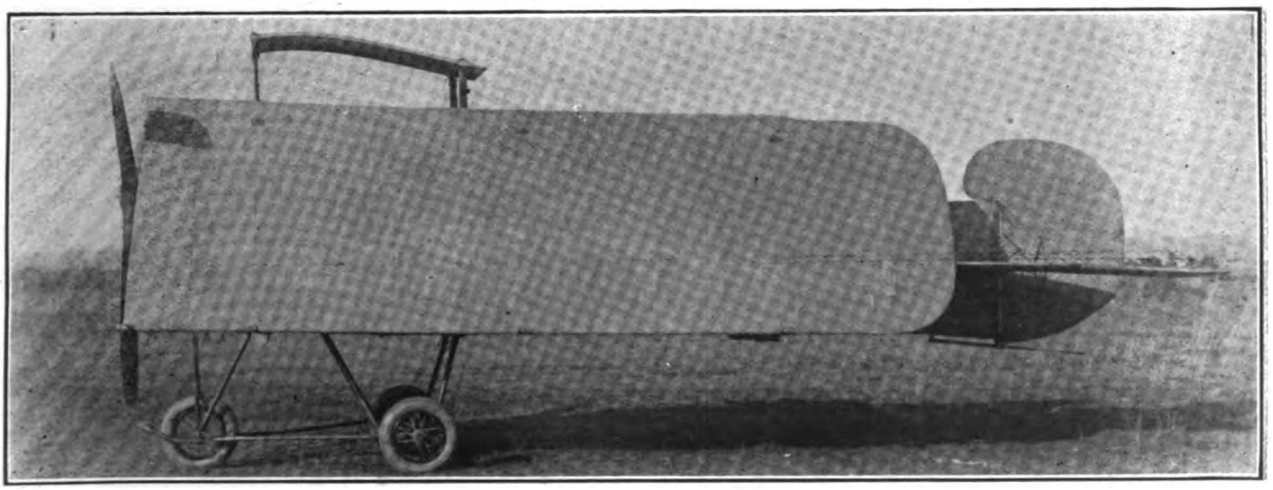
Front View of Curtiss Military Biplane, Showing Three-Bladed Tractor or Screw, and Provision for Folding Main Plane Formation.

The three-bladed tractor screw, nine feet in diameter, is driven by a roller chain from the engine shaft. The motor is fitted with a 22-pound flywheel, and the Diamond roller chain is of .75 inch width and 1.25 inches pitch. This runs over a 16-tooth sprocket on the engine and a 30-tooth sprocket on the propeller shaft. The chain pull and propeller thrust are cared for by a large sized Shafer ball bearing and the rear end of the propeller shaft is carried by a Hess-Bright radial bearing. The engine is mounted low and the centre of thrust is located at the centre of resist-

Digitized by Google

Three-Quarter Top View of New Curtiss Tractor Biplane, Presenting Fuselage and Tail Formation.

ance. The centre of gravity is slightly below the centre of lift. The radiator is on the forward end just back of the screw.



The principal outside dimensions are: Spread, overall, 28 feet four inches; spread, top plane, 37 feet four inches; chord, five feet one inch; distance between planes, 66 inches; length, 24 feet; approximate weight, 1050 pounds; approximate speed, 50-55 miles an hour; approximate climbing speed, 150 feet a minute; carrying capacity, 600 pounds.

Interest in trans-Atlantic flying has been renewed by the offer of a prize of $50,000 by Lord Northcliffe of London, England, for the first aviator to make this trip in 72 hours. It is understood that no less than five aviators have signified their intention of competing for the award. This makes the third aviation prize offered by Lord Northcliffe, his first being for a flight from London to Manchester, and his second for one from London to Edinburgh. Some criticism has been offered in this latest instance, because of the time limit. The entrants include Gordon England and Col. Cody of Great Britain, Bleriot of France and Rumpler of Germany.

A grand prix of some $80,000 is offered in France for the apparatus which in the minds of a committee is considered of exceptional merit from the point of view of improving the stability of aeroplanes. The competition is to be international, and is to be conducted under the auspices of the French government, which is to have an option, until Jan. 1, 1915, on the purchase of the invention. To qualify the apparatus must have been continuously employed during a flight of 100 kilometers (about 62 miles) over a closed circuit and at a minimum speed of 60 kilometers an hour.

The Aero Club de France is to offer another prize of $2000 for the longest flight without alighting during 1913. The first 1000 kilometers must be made over an out-and-home cross country course, after which the competitor may continue as long as he sees fit over a closed course, only completed circuits to count. Each competitor must carry two sealed barographs, and one record must be complete or the flight will not be recognized.

It is understood that Harold F. McCormick, son-in-law of John D. Rockefeller, is the first American civilian to secure an hydraeroplane for his private use. He has purchased a Curtiss flying boat, which he will utilize in making trips between his office in Chicago and his home at Forest Lake, 25 miles distant, along the shores of Lake Michigan according to the announcement.

LATEST REPORTS FROM FLOODED DISTRICTS.

WHILE the early reports from the flooded districts in Ohio and Indiana, as published in the last issue of The Automobile Journal, were highly reassuring, subsequent information places the industry in a still more favorable light. One concern, the Republic Motor Car Company, Hamilton, O., which was reported from Fort Wayne, Ind., as a serious loser, writes that while the city was badly devastated by the flood the Republic factory was not at all damaged. Shipments were delayed for a week or 10 days, but the company was in a position to resume regular deliveries before traffic conditions had returned to normal.

The Esterline Company, Lafayette, Ind., maker of electric lighting and starting systems, was able to remove thousands of dollars' worth of valuable material, through the enterprise of its engineers. At 7 in the morning a gauge was established and hourly readings were taken until 10, at which time the engineers predicted that the levee would overflow between 2 and 3 in the afternoon. The overflow came on schedule time and at 6 in the evening the factory buildings were under 18 feet of water.

The Esterline Plant at Lafayette, Ind., as It Appeared When Under 18 Feet of Water.

In the meantime, the company took from its buildings about $100,000 worth of merchandise and tools, all its records and office furniture and fixtures. The belts were removed from the machines and the latter painted with heavy grease. It is estimated that this precaution saved a loss of at least $60,000. The finished goods removed from the plant were sufficient to take care of customers for three weeks, and the tools and machinery were shipped to Indianapolis, where the new plant was opened April 15.

The Motor Car Manufacturing Company, Indianapolis, Ind., maker of the Pathfinder, adopted a course somewhat similar. When the officials of the company learned that the levee was in danger the entire day was spent in elevating office furniture, files, desks, etc., and finished cars, uncompleted chassis, complete stock of parts, tools and all movable machinery were taken to the second floor. When the flood came it was unable to damage the company seriously.

The Speedwell Motor Car Company, Dayton, O., appears to have escaped serious loss in a somewhat miraculous manner. The pressure of the flood upon the Big Four railroad bridge and embankment, about a quarter of a mile from the plant, was so great that they gave way as the water reached within two squares of the Speedwell factory. This proved sufficient to retard the rise.

Forty employees of the Dayton Engineering Laboratories Company, maker of Delco systems, were caught in the building and were prisoners for 48 hours. During that time they rescued 30 men, women and children, who floated to them on wreckage. By establishing a wire trolley across streets and over the tops of buildings, and with the aid of people marooned on the roofs of other factories, they were able to secure a food supply, this being cooked by electricity generated by an automobile motor. The finished stock was on the third floor and was undamaged.

The Maxwell Motor Company, successor to the Dayton Motor Car Company, reports a loss of $50,000 as a result of the flood in its Dayton plant. The American Tank & Pump Company, with main offices in Cincinnati, has a Dayton factory which was in the heart of the flooded district, approximately 12 feet of water being in the plant. It reports no serious damage, although its patterns, etc., were covered with mud, necessitating considerably delay. It resumed operations, under difficulties, previous to April 8.

The water in the plant of the Brown Commercial Car Company, Peru, Ind., averaged about

Digitized by Google

two feet deep, and while the property damage was but little and the stock loss was not great, the concern was inconvenienced through the necessity of thoroughly cleaning the factory. Part of the goods damaged was of a character which could easily be replaced, and the company was not seriously handicapped.

The Model Gas Engine Works, Peru, Ind., foresaw the flood and oiled all its machinery in preparation therefor. Being located on the highest point of ground in the city, the water only reached a depth of 10 inches, as against 30 feet in some sections, and three days afterward the plant was working with full force.

The Northwestern Chemical Company, Marietta, O., reports four feet of water in the top story of its factory and a heavy merchandise loss. It expected to resume operations before April 15 and hoped that deliveries would not be delayed longer than a week or two.

The Arbenz Car Company, Chillicothe, O., maker of Arbenz cars, had some water in its plant, but expected to resume normal operations within a short time. The Crescent Motor Truck Company, Middletown, O., reports no damage, as the water did not reach its plant.

Some mention was made in the last issue of the excellent work done by automobiles in the work of rescue and rehabilitation. Motor trucks were particularly valuable in this respect. In Dayton these vehicles removed over 1000 dead animals and hundreds of tons of debris from the streets in one week.

Although several dealers lost heavily, there is every evidence of optimism in the reports from these. In Dayton, where the dealers were the heaviest losers, preparations were soon made to continue the business. The Twyman Motor Car Company, Studebaker distributor for southern Ohio, opened its Dayton store as refuge station No. 1, within 20 minutes after the receding water made entrance possible. For several days tween 500 and 600 people were fed there. Another concern was early in the field with the following announcement of its future policy: "Hurrah for Greater Dayton. Orders promptly filled here."

QUALITY, NOT QUANTITY.

Mercer Automobile Company Believes in a Policy That Leads to Specializing.

Maintaining that automobile manufacturing development, particularly during the past two years, has proven the existence of a market for cars of a distinct class, each selling at a different price and appealing to buyers having individual tastes, the Mercer Automobile Company, Trenton, N. J., believes in a policy that leads to specializing. Since its organization some five years ago this concern has followed the plan of building machines of quality rather than in quantity, and its entire attention is focussed upon the production of two chassis models, both of which are calculated to meet the demand for a medium weight car. One of these chassis is fitted with four and five-passenger touring bodies and the other as a roadster.

Packard Trucks Engaged in Relief Work in Dayton, O., Taking on Supplies at Memorial Hall.

The company points to the fact that Mercer cars have won an enviable reputation in this field, and while this is due in a measure to the success which they have achieved in contest work, it is worthy of note that even in racing many of the victories have been won by owner's machines, entered without the knowledge of the factory organization. The officials of the company state as their belief that the future of the automobile industry will see greater attention to specialization on the part of those makers who expect to become permanent factors in the motor car field.

THE REPAIR SHOP AND GARAGE.

Running In Bearings with Motor Operating on Coal Gas—Removing Carbon from Cylinders by the Ozo Process—New Motor Fuels.

AFTER fitting new bearings to a motor it is considered good practise to "run" them in on the block before replacing the power plant in the chassis. While this may be accomplished by utilizing the flywheel of the motor and a belt drive, or by operaitng the engine under its own power, the former may not always be convenient. The latter plan involves expense owing to the present high price of gasoline. Coal or illuminating gas is utilized by several English car manufacturers, who give their motors a thorough testing before the road work. The methods employed are presented at Figs. 1 and 2, respectively, and are of interest in that expensive fittings are not

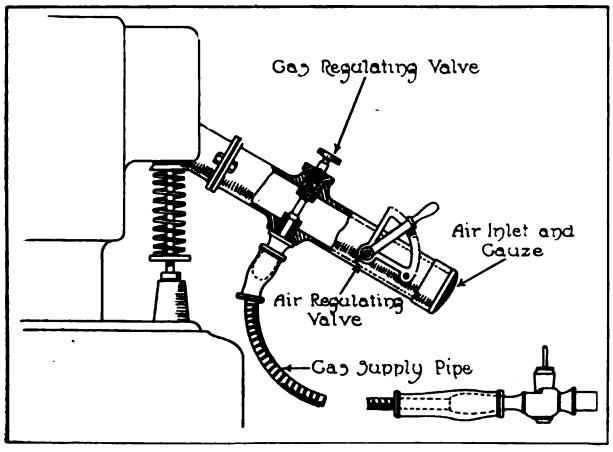

Fig. 1—Utilizing Coal Gas When Carburetor Is Equipped with an Auxiliary Air Intake.

required and that considerable economy is effected.

The drawing at Fig. 2 illustrates a simple method in that the existing carburetor is retained and the plan may be utilized where all of the air passes through it. As will be noted by the sketch a tapered wooden plug is fitted to the air intake of the vaporizer. Six holes of .125-inch diameter are drilled in the plug member, into which the rubber supply pipe is inserted. The supply of gas is controlled by a stop cock, the latter permitting of regulating the mixture. The conventional throttle is utilized for controlling the motor speed.

The plan outlined at Fig. 1 is adaptable where the carburetor is equipped with an auxiliary air intake in addition to the fixed or low speed member. When this form is employed the intake pipe is removed and a short pipe fitted in its place, this having one end covered with a fine gauze. The latter serves as the air intake. Between this and the motor is a simple butterfly throttle valve, which controls the supply of air. The gas enters the pipe member by a nipple, the outlet of which is adjustable by another valve. Connection between the source of supply and the nipple is by a flexible tube.

The motor is operated under a partial load and the saving in fuel expense is said to be considerable, especially when it is remembered that in manufacturing the engine is "run in" for some time. It is estimated that about 200 cubic feet of illuminating or coal gas corresponds to a gallon of gasoline. As the cost of gas is approximately $1 for 1000 cubic feet, the economy of the methods outlined is manifest.

NEW MOTOR FUEL.

A new motor fuel called parol has been invented by two men in Johannesburg, South Africa, and it is held to be superior to gasoline in efficiency and much cheaper. It is made from kerosene, its conversion being accomplished by a chemical process and without the use of heat. Aside from the chemicals employed the only accessories required for the preparation of the fluid in large quantities are tanks, pumps and mixers. It is claimed that by means of the chemical process utilized that property which creates carbon and soot is removed, and that the strong odor of kerosene is also eliminated when the motor is operating on the fuel.

The kerosene utilized in tests is of 150 fire test and the cost of parol as a finished product is estimated at about 50 per cent. more than kerosene and 25 per cent. less than gasoline, measured by the present prices. In addition to being more economical, greater efficiency is claimed than with gasoline, while it is stated that the motor may be started as easily as with the conventional fuel. It is adaptable to any ordinary type of carburetor and motor.

A test was made of parol with a model T Ford car carrying five persons from Johannesburg to Pretoria, 36 miles over exceptionally hilly roads.

Digitized by Google

The distance was covered in 1:40:00 and 72 miles were completed on two and two-thirds gallons, or about 27 miles to a gallon. It is stated that

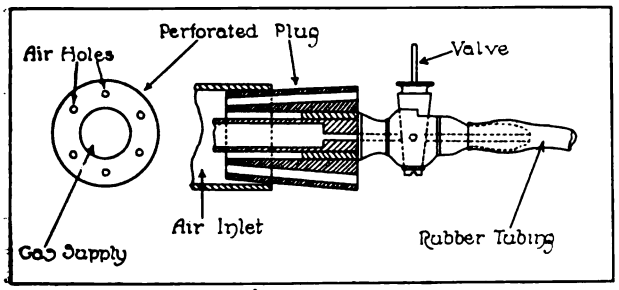

Fig. 2—Method of Supplying Coal Gas to Carburetor and Operating Motor When "Running in" the Bearings.

the motor ran much cooler than with other fuels and that no odor or smoke was noticeable. The new fuel is attracting considerable attention in motor circles because of its withstanding all tests successfully.

OZO, A CARBON DESTROYER.

The progressive repairman does not hesitate to install time and labor saving devices. Not only is he benefited, but the customer as well, in that the latter is saved considerable expense. The cost of removing carbon from the cylinders of a motor varies, but in the majority of instances it is necessary to displace the cylinders to clean out the deposits, and the entire work not only takes time, but the labor is costly.

A carbon removing outfit, which not only is said to be practical, but capable of doing the work at slight expense and in short time is the Ozo, marketed by the Ozo Company, 18 Tremont street, Boston. Its principle feature is that the accumulations may be removed without any other work than taking out the spark plugs or valve caps, and the maker states that an ordinary four-cylinder motor may be cleaned in 20 minutes.

The system does not include chemicals or liquids, a harmless gas being introduced into the cylinders where it burns the carbon and without any accompanying flame. At Fig. 3 is presented the outfit and the sketch shows the method of operation. The gas stored in a container provided with suitable valves, etc., passes through a retarding chamber or regulator, which is employed for the purpose of reducing the pressure to the required number of pounds.

It then flows through a rubber hose to the automatic torch, attached to which is a flexible tube. The latter is inserted through the spark plug or valve cap opening into the cylinder and the gas uniting with the carbon destroys the latter entirely. Suitable controls are provided for the workman and it is stated that the operation is so simple that the work may be accomplished easily by the most inexperienced.

The Ozo method has been adopted by a number of garages and service stations and its principle is similar to that employed by leading gas engine manufacturers abroad. Complete details will be forwarded by the company on request.

FITTING WIRES OR CABLES.

In rewiring the car and when the leads pass through the battery box, floorboards, etc., it is sometimes difficult to start the wire through the opening because the diameter is less than that of the lead. The usual practise is to ream the hole larger. When wires are slightly smaller than the opening they may be started by placing the end to be inserted on a flat, hard surface and rolling the insulation with another piece of hard, flat material. This will constrict the end of the insulation so that it may be readily inserted and drawn through.

TESTS OF BENZOL.

According to tests conducted by the maker of the Napier, an English car, benzol is more satisfactory as a fuel than gasoline. Brake horsepower tests with a 15 horsepower Napier showed that 28.3 horsepower was developed with gasoline and 28.6 with benzol. Although the gain appears slight the fuel consumption worked out

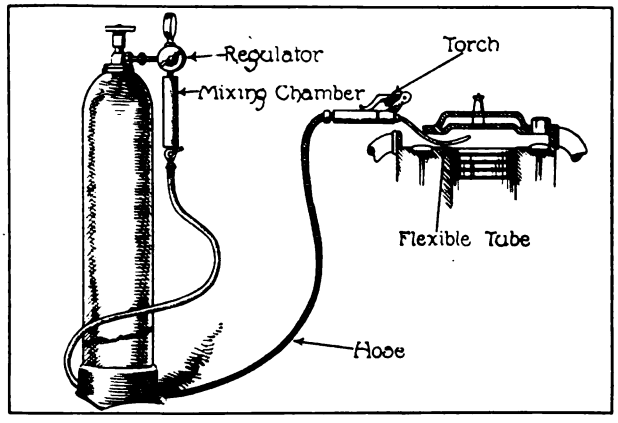

Fig. 3—Ozo Carbon Destroying Outfit, Utilization of Which Removes Deposits Without Displacing Cylinders, Etc.

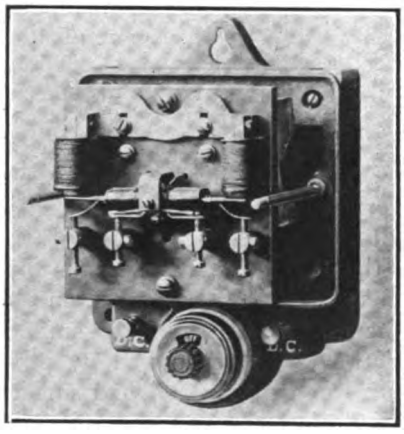

at .75 pint of gasoline for each horsepower developed for an hour, only .7 pint was required with benzol.

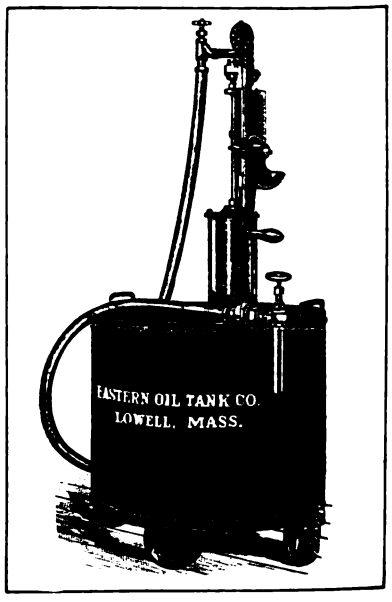
GARAGE AND REPAIR SHOP EQUIPMENT.

WESTINGHOUSE RECTIFIER.

A number of small garages have customers utilizing storage batteries for ignition or lighting and when the car is not equipped with a dynamo these must be sent to a charging station unless the garage has a charging panel. The amount of such work does not warrant the installation of a large panel, consequently when attention is needed the batteries are carried to the nearest service station.

Westinghouse Type G Vibrating Rectifier.



The Westinghouse Electric & Manufacturing Company, East Pittsburg, Penn., is producing what is termed its type G vibrating rectifier, designed for charging three-cell lead batteries from an alternating current circuit. The rectifier can be operated on any 60-cycle alternating current lighting circuit of 100 to 120 volts, and will charge three cells at a rate of six to eight amperes. The apparatus is simple to operate, requiring no other attention than connecting the attachment plug to a lamp socket and the lower binding posts to the battery. Polarity need not be observed. The interruption of the flow of current does not interfere with its operation as the rectifier will restart as soon as the power comes on again. This makes for convenience, especially when the cells are to be charged during the night.

The rectifier shown in an accompanying illustration consists practically of a polarized relay acted upon by two alternating current magnets, so that it vibrates in synchronism with the alterations of the current, and arranged to reverse the connections of the circuit as the current reverses. The vibrating arm is magnetized by current from the direct current side, so that one end is permanently north and the other south, depending on which way the battery is connected. When the alternating current is in one direction the upper poles of both stationary magnets are north, attracting the south end of the vibrating arm and repelling the north end. When the current reverses, the poles of the magnets become south, attracting the north end of the vibrating arm and repelling the south end. This reverses the connection of the alternating current to the direct circuit, but as the direction of current has also been reversed, it flows into the direct current circuit in the same direction as before. The reversal of the connections thus takes place every time the current reverses, so that the result is a pulsating direct current. A transformer reduces the voltage to the proper value.

Five feet of lamp cord and an attachment plug are furnished, and six feet of similar cord with connecting clips for use between the battery and the rectifier, also a snap switch.

EASTERN RUNABOUT FUEL OUTFIT.

The Eastern Oil Tank Company, Lowell, Mass., maker of oil and gasoline storage systems, tanks, cabinets, etc., is manufacturing the Eastern runabout system, especially designed for service in garages. As will be noted by an accompanying illustration it is of the portable type and being fitted with ball bearing, rubber tired wheels, may be moved easily about the garage and even to the sidewalk. The wheels are of the swivelling type, mounted beneath the tank proper and suitable handles are provided. Its capacity is 60 gallons.

Eastern Runabout Gasoline Outfit.

The pump is of the double-acting type, discharging a continuous stream of gasoline and one turn of the crank pumps half a gallon. A dial is incorporated, registering accurately the amount of fuel discharged, and the discharge nozzle is well adapted to any type of fuel tank. It is also fitted with a shut-off valve, preventing waste from overflowing.

FORMULAE AND USEFUL MECHANICAL TABLES.

To Remove Old Enamel.

To remove old enamel lay the articles horizontally in a vessel containing a concentrated solution of alum and boil them. The solution should be just sufficient to cover the pieces. In 20 or 25 minutes the old enamel will fall into dust, and the article may be polished with fine emery.

Testing Solder.

To test solder to learn whether it is of good quality, hold it up near the ear and bend it. If it cringes or makes a crackling noise, it is good. If not, it is poor, having too much lead and not enough tin in the composition.

Rust Joint Composition.

A rust joint composition or cement may be made of sal ammoniac one pound, sulphur one-half pound and cast iron turnings 100 pounds. The whole should be thoroughly mixed and moistened with a little water. If it is desired to have the joint set very quickly, add one-quarter of a pound more sal ammoniac. Care should be taken not to use too much of the last named material, or the mixture will deteriorate.

Sweating Aluminum to Other Metals.

Aluminum may be sweated to other metals by the following method: First coat the aluminum surface to be soldered with a layer of zinc. On top of the zinc is melted a layer of an alloy of one part aluminum to 2.5 parts of zinc. The surfaces are placed together and heated until the alloy between is liquified.

Soft Alloy.

A soft alloy which will adhere tenaciously to glass, metal or porcelain, and which can also be utilized as a solder for articles which cannot be subjected to a high degree of temperature, is made as follows: Obtain copper dust by precipitating copper from the sulphate by means of metallic zinc. Place from 20 to 36 parts of the copper dust, according to the hardness desired, in a porcelain mortar, and mix well with some sulphuric acid of a specific gravity of 1.85. Add to this paste 70 parts of mercury, stirring constantly, and when thoroughly mixed, rinse the amalgam in warm water to remove the acid. Allow it to cool from 10 to 12 hours, after which time it will be hard enough to scratch tin. When ready to use, heat to 707 degrees Fahrenheit and knead in an iron mortar until plastic. It can then be spread on any surface, and when it has cooled and hardened will adhere most tenaciously.

Tempering Tool Steel.

The following gives the temperature in degrees Fahrenheit necessary to produce the required color, when tempering hardened steel: Lathe, shaper and planer tools, 430 degrees, very light straw color; 450 degrees, light straw color. Taps and dies, 470 degrees, dark straw color; 490 degrees, very dark straw color. Chisels, 500 degrees, brownish yellow; 520, yellow tinged with purple; 530 degrees, light purple. Springs, etc., 550 degrees, dark purple; 570 degrees, dark blue.

Proportional parts of lead to one pound of pure block tin which when melted will have the temperature in degrees Fahrenheit necessary to produce the required color on hardened steel, by simple immersion, are given below:

Color	Temperature degrees	Pounds of lead to one of tin
Very light straw color	430	1.750 to 1
Light straw color	450	2.125 to 1
Dark straw color	470	2.500 to 1
Very dark straw color	490	3.500 to 1
Brownish yellow	500	4.750 to 1
Light purple	530	7.500 to 1
Dark purple	550	12.000 to 1
Dark blue	570	25.000 to 1

TETZLAFF DISCUSSES LUBRICATION.

Some of the Reasons Which Impelled Him to Select Dixon's Graphite.

Teddy Tetzlaff, holder of the world's road racing record, has made a somewhat extensive study of automobile lubrication, testing one make of oil after another in the various bearings of his car, and watching the effect upon the machine. its speed, etc. He has adopted the line of graphite greases made by the Joseph Dixon Crucible Company, Jersey City, N. J., and some of his reasons for this action are set forth by him as follows:

The most essential thing in the successful operation of an automobile is proper lubrication, and the lack of knowledge upon this subject displayed by the average car owner and driver is astonishing. You cannot run your machine without lubricant, but the difference between oil and oil, and grease and grease, is not understood by every owner. Different makes of cars require different kinds of greases; different parts of the same car require different greases. The owner does not know this because he has never gone to the trouble to post himself upon the subject.

The average car owner believes that his gears and bearings are smooth. But if he will look at them under a powerful microscope he will see that these so-called smooth bearings look very much like a nutmeg grater, showing little pin points sticking up in the metal, tool marks and other abrasions. These little pin points lock and interlock, producing when the bearing surfaces slide over one another what is called friction. When you realize that at least 20 per cent. of the power generated in your engine is lost because of friction before it is delivered to the rear wheels, you will understand the importance of using lubricants which will cut down this friction as much as possible.

Oil or grease is supposed to keep these bearing surfaces sufficiently apart so that these irregularities cannot interlock. Under normal conditions it does this to some extent, but when the heavy pull comes with the car in operation, the oil or grease squeezes out from between the working parts and we have little or no lubricant left when we need it most. But if there is a little flake graphite mixed with the oil or grease, it first fills up the pores and irregularities in the bearing surfaces and buries the pin points under a veneer like surface of remarkable smoothness and endurance.

At one time I experimented for five days with various greases in my transmission and wheel bearings. but found that my gearbox heated up with all of them. When I substituted Dixon graphite grease No. 677, my bearings ran cool and all trouble was eliminated. At another time I made a comparative test on the one-mile motordrome at Los Angeles, being accurately timed by three stop watches. By an application of Dixon's graphite I was enabled to increase my speed one second a mile at 90 miles an hour, which proved to me that graphite brought the friction down to the minimum.

The Cadillac Motor Car Company, Detroit, claims the first sale of an automobile in Dayton, O., since the flood. It was one of the Cadillacs handled by H. M. McCord, which although it had been entirely submerged for 30 hours, aside from the deposit of mud, was found to be none the worse for its experience.

IN THE REALM OF THE MOTORCYLIST.

Manufacturers Escape All Damage in Recent Floods---Denver Seems to Be Favored as F. A. M. Convention Seat---News Notes of the Industry and the Clubs.

SO FAR as it has been possible to learn but two motorcycle manufacturers were affected in any manner by the recent floods in Ohio and Indiana, these being the Miami Cycle & Manufacturing Company at Middletown, O., and the Davis Sewing Machine Company at Dayton. In neither case was the plant at all damaged, but the employees lost heavily.

General View of the Miami Cycle & Manufacturing Company's Merkel Plant in Middletown, O.

The Merkel factory in Middletown is located on the highest point in the city and was a long way from the stricken region. However, many of the officials of the company, as well as the workmen, lived in the section which was badly flooded. Of course, shipments were badly delayed, owing to the inability of the railroads to offer transportation, but the company continued the work of production, storing the machines until such time as they could be moved.

The Davis Sewing Machine Company's factory, where Dayton machines are produced, is similarly situated, and the flooded portion of the city, which perhaps was as badly affected as any in the entire district, was about one mile distant. It follows that the company is in practically the same condition as the Merkel.

Denver to Get Convention?

At the recent meeting of the board of directors of the Federation of American Motorcyclists at the Auditorium Annex hotel, Chicago, Directors Sauer and Collins gave their views of the California situation, where the Western Federation of Motorcyclists is waging war on the older body. The board, from reliable information in its possession, is of the opinion that the matter will soon be cleared up satisfactorily to all concerned. It was voted the sentiment of the board that means be devised to bring about such a distribution of the F. A. M. directorate as to insure all parts of the United States equal representation.

The competition committee recommended that the 1913 convention be awarded to Denver, Col., during the week of July 28. It was decided that where three or more sanctions are issued in a week to a promoter that the chairman of the competition committee be empowered, at his discretion, to place all such sanctions on one sanc-

The Sign of MERKUALITY

On the road this summer you will often notice this trade-mark on the tanks of motorcycles that scoot past you on the road and run away from you on the hills. Whenever you see this "Yellow Jacket" you will not be able to help thinking: "There GOES the only motorcycle in the world with a Self-Starter." You will envy the rider of that machine, for you will know that he rides the best motorcycle made. That little trade-mark of quality will indicate that he is a fortunate rider of

THE SELFSTARTING—TWO SPEED—SPRING FRAME
FLYING MERKEL
MOTORCYCLE

Why wait until the riding season to have it demonstrated to you that the Flying Merkel "Yellow Jacket" models are the snappiest, fastest and most powerful vehicles on two wheels? It may be too late then. Our season's output is entirely contracted for now, but your dealer may be able to supply you. Better see him today. There are just four things to remember: 1st—No more laborious, back-breaking pedalling to start your motor. The Merkel Self-Starter positively starts the motor every time with both wheels on the ground by simply depressing a small lever with the left foot. 2nd—The Two-Speed Gear will enable you to climb any hill that nature ever evolved. 3rd—More than 300 inches of spring steel between you and the road absorbs every vibration and jolt and makes every rough spot seem like a parlor floor. 4th—Write today for our descriptive art catalog. It will be forthcoming in the next mail if you just address

tion blank and that for sanctions so issued it will be considered that the races are not concluded until Sunday night, when all prizes will be due.

Joseph Ebel of St. Louis, Mo., and His Emblem.

The board concluded it had not power to increase the fees of referees as they cannot change the printed rules for this year, which have been published. Numerous other minor matters were considered.

Many Girls on Kansas Tour.

So many young women have planned to participate in the annual tour of the Kansas Short Grass Motorcycle Club this summer that it has been arranged for one division of the tourists to be made up of girl riders entirely. The idea of a girl's division was conceived by Miss Inez Patterson, daughter of President B. J. Patterson of the F. A. M., and it is probable that she will be chosen captain of the section. Invitations have been sent to girl riders all over the country to join the tour.

Addition to Henderson Plant.

The Henderson Motorcycle Company, Detroit, has purchased property adjoining its present factory and will erect a three-story building. The company will increase its output to meet the demand for Henderson motorcycles.

Bosch in the Flood.

P. I. Haynes, the Harley-Davidson agent in Columbus, O., writes that during the high water mark in the flood Benjamin Ept's machine and a number of others of that make were completely covered with water, mud, etc., for over 48 hours. After their rescue, the carburetors were dismantled, the tanks refilled with gasoline, and on the first push of the pedals they were off. It appears that the Bosch magnetos, with which these machines were equipped, were in no way disturbed by the experience, which is particularly gratifying to the maker, the Bosch Magneto Company, New York City.

Merkels in Telephone Work.

Miami Cycle & Manufacturing Company, Middletown, O., reports the receipt of an order to equip the entire Bell telephone system of Cincinnati with seven horsepower Flying Merkel chain driven machines. The telephone company has been experimenting with a number of different makes, and the final selection naturally is very gratifying to the Miami concern.

A New Blue Streak.

S. A. Falor, manager of the motorcycle tire department of the Goodyear Tire & Rubber Company, Akron, O., announces a new Blue Streak tube. It is understood that this tube will be made 20 per cent. stronger than those formerly produced by this concern, and that it was designed especially for use with 1913 machines, which are being made heavier and faster than heretofore.

Merkel Defeats Indian.

Recently the motorcycle enthusiasts of Elyria, O., were treated to an interesting conflict between riders in a two-mile race on a local skating rink. The machines were both of seven horsepower, the Merkel being ridden by Robert Parker and the Indian by Carl Hiller. The former won by a margin of 10 feet.

Tourist Trophy Races.

Secretary-Treasurer Gibson of the F. A. M. has received from the secretary of the Interna-

Goodyear Tire Salesman Explaining Merits of His Product to Bernard Steere, Providence, R. I., a Harley-Davidson Rider.

tional Federation of Motorcycle Clubs, entry blanks for the senior and junior Tourist Trophy races to be held on the Isle of Man, England.

June 4 and 6. It is desired that a team representing the F. A. M. in America compete. Entry blanks can be obtained of Secretary Gibson.

Annual Herring Run.

The Providence Motorcycle Club, Providence, R. I., held its annual herring run to Taunton, Mass., Sunday, April 20. Approximately 300 motorcyclists participated in the run, which was equal to any similar event ever held by the club. The roads were found to be in good shape and no untoward events occurred during the day. Save for the fact that the weather was quite cool, the conditions were ideal. On the arrival at Taunton the members of the Taunton Motorcycle Club met the Providence men and entertained them royally with a banquet in the club's quarters.

Harley-Davidson's Birthday.

The Harley-Davidson Motor Company, Milwaukee, Wis., recently celebrated its fifth anniversary. The growth of this company at Milwaukee has excited the admiration and wonder of every person acquainted with the facts. The three Davidson brothers and William S. Harley began building motorcycles in 1901, but it was not until five years ago that the company was incorporated. While many others have striven for greatly increased output, this concern has always concentrated its efforts to achieve the distinction of building quality motorcycles, and the reputation attained by these efforts will be preserved during coming years.

The company now has a most modern factory with 1277 employees, with a monthly payroll of $85,000. The 1913 output will be 17,000 machines, valued at $4,505,000. The factory has 59 departments and the floor space is now 224,150 square feet. These figures give some idea of the enormous growth since the beginning in 1901, although the most rapid strides have been accomplished during the five years since its incorporation.

Club Notes, Here and There.

The Fox River Motorcycle Club, Aurora, Ill., has been organized with the following officers: President, John Jamie; vice president, Joseph Slaker; secretary, Robert Horton; treasurer, William Healy; captain, George Rees.

The Englewood and Chicago Motorcycle clubs, Chicago, have been combined. President Purdy of the Chicago club was also elected president of the Englewood club and several of the members belonged to both clubs, so that it was decided that fusion would best serve the interests of all.

The Reading Motorcycle Club, Reading, Penn., is making arrangements for a reliability run the latter part of July. The route has not been selected, but probably will be to Pottsville and return, going by way of Harrisburg, Sunbury and Danville, the distance being 210 miles, to be covered in 11 hours.

Robert Parker, Merkel Winner, and Carl Hiller, Indian, a the Start of Recent Match Race in Elyria, O.

The Worcester Motorcycle Club, Worcester, Mass., will have a hill climb on Dead Horse hill, May 11.

The Indian Motorcycle Club of Cleveland, O., is planning a run to Niagara Falls some time in June, when it will be entertained by the Buffalo Motorcycle Club. A run will also be held to Cedar Point some time during the month of June.

NEW INCORPORATIONS AND MAKER'S NOTES.

The following concerns have been incorporated recently to manufacture and deal in automobiles, accessories, etc.:

Ivey Motor Truck Company, Inc., Buffalo, N. Y.; $10,000; Charles A. Ivey, A. L. Rustling, Frank S. Heller.

Lowell Buick Company, Lowell, Mass.; $15,000; Milo W. Hale, Jr., Fred B. Emerson, Daniel D. O'Dea.

Signal Motor Truck Company, New York City; to manufacture motor trucks, cars, coaches, etc.; $350,000; R. H. Grimes, L. B. Case, R. Gibson, Jr.

Hutchinson Motor Company, Woodbury, N. J.; $100,000; general automobile business; T. Hutchinson, J. A. Hutchinson, M. F. Cattell.

Rochester-Mais Commercial Car Company, Rochester, Ind.; $25,000; J. A. Mais, A. C. Davisson, Earle A. Miller, J. M. Ott, R. P. True.

Automobile College of Salesmanship, Indianapolis, Ind.; $10,000; Charles H. Hettinger, Turner D. Bottoms, Fred G. Braden.

General Auto Trucking Company, Inc., New York City; $25,000; G. W. Freeman, A. A. Benedise, T. G. Gannon.

Chicago Auto Painting Company, Chicago; $1000; M. H. Allen, Alexander Wolf, C. B. Staffner.

Smith Motor Car Company, Newark, N. J.; $25,000; J. L. Smith, J. W. Mason, L. W. Smith.

B. B. Motor Car Company, Conway, S. C.; $2000; T. J. Bell, E. T. Blecker, E. J. Sherwood.

Edwards-Knight Sales Company, Newark, N. J.; $125,444; Arthur J. M. Edwards, Howard Isherwood, W. Eugene Turton.

Pender Auto Compnay, Burgaw, Va.; $15,000; C. H. Sodergrist, I. N. Brown, F. M. Lewis, W. O. Sodergrist.

Stapleton Motor Sales Company, Okmulgee, Okla.; $2000; L. S. Skelton, J. Belford, E. M. Stapleton.

Church Motor Car Company, New York City; $1,000,000; H. E. Latter, W. J. Maloney, N. P. Coffin.

Easy Starter & Speeder Company of New York, New York City; $25,000; F. R. Hansell, G. H. B. Martin, S. C. Seymour.

Santa Ana Electrical Company, Santa Ana, Cal.; $10,000; J. G. Quigg, Anna Helen Neely, Thomas Neely.

Hampton Manufacturing Company, Indianapolis, Ind.; $35,000; to make automobile accessories; W. F. Hadley, S. B. Nusbaum, S. Rubens, M. Moskin.

Gustav Schaefer Wagon Company, Cleveland, O.; $55,000; to manufacture automobile bodies; Ernest Schaefer, Charles E. Moritz, Arthur Kruse, Henry G. Schaefer, Anna M. Schaefer.

Derrickson Manufacturing Company, Muncie, Ind.; $125,000; to make automobiles; Harry S. Osborn, H. L. Kitselman, R. C. White.

Auto-Signalite Company, New York City; $2000; D. E. Koblish, R. C. Norton, A. D. Chersan.

WITH THE MANUFACTURERS.

C. Arthur Benjamin has been appointed general sales manager of the American Locomotive Company, New York City, maker of Alco cars and trucks. Before joining the latter company he was for four years sales manager of the H. H. Franklin Manufacturing Company, Syracuse, N. Y., two years sales manager of the Babcock Electric Company, and subsequently a distributor for Packard and Hudson cars in Syracuse, N. Y.

Harold D. Bornstein, well known in Boston and New England motor car circles, is with the Premier Motor Car Company of New England, where he has joined the sales department and will assist in the advertising and publicity work. While connected with the Boston branch of the Velie Motor Vehicle Company, Moline, Ill., maker of Velie cars, he helped build up a large New England business.

T. J. Megear has been made branch manager and F. von A. Cabeen, Jr., sales manager of the new Philadelphia branch established by the American Locomotive Company, New York City, maker of Alco cars and trucks. Mr. Megear was formerly secretary and Mr. Cabeen vice president of the Longstreth Motor Car Company and both have long been connected with Philadelphia territory.

F. N. Schwab was recently placed in charge of the Chicago branch of the Speedwell Motor Car Company, Dayton, O., maker of Speedwell cars and motor trucks. He was formerly connected with the organization of the National Cash Register Company of Dayton.

Adolph Daimler, president and general manager of the Daimler Motoren Gesellschaft, Untertuerkkeim-Stuttgart, Germany, died recently at the age of 42 years. He was a son of Gottlieb Daimler, a pioneer in the automobile industry in Germany and one of the leading men in the industry in that country.

O. J. Rhode, treasurer and manager of the Splitdorf Electrical Company, Newark, N. J., maker of Splitdorf magnetos, has returned from a business trip to England, during which he established a branch in London. The new Splitdorf quarters are located at 6 City Road, Finsbury Square. Other Splitdorf stations are to be opened at Toronto, Can., and Atlanta, Ga.

The Cole Motor Car Company, Indianapolis, Ind., maker of Cole cars, has appointed the following distributors: C. E. Simmons, Adrian, Mich.; Enterprise Machine Company, Asheville, N. C.; Cole Sales Company, Baltimore, Md.; William H. Hopkins, Bath, N. Y.; Lahr Motor Sales Company, Bismarck, N. D.; Breese Garage, Breese, Ill.; J. E. Osborne, Carroll, Ia.; Thompson Anderson, Charleston, Miss.; Hitsch Bros., Chattanooga, Tenn.; Walter Haynie, Covington, Tenn.; Crestline Garage Company, Crestline, O.; N. R. Herrick & Co., Eustis, Fla.; Mrs. Laura Heintz, Hammond, Ind.; Patterson Auto Sales Company, Hamilton, Ont.; M. J. Bliss, Hartford, Conn.; S. J. Harrigan, Joliet, Ill.; Ayer Manufacturing Company, Keokuk, Ia.; N. B. Bronner, Little Falls, N. Y.; Cole Motor Company, Milwaukee, Wis.; John N. Taylor, Moberly, Mo.; Osmanson Bros., Morris, Ill.; Barngrover Auto Company, Newton, Ia.; W. J. Freeling, Oakland, Cal.; Ford Auto Company, Paterson, N. J.; Gulf Coast Garage & Sales Company, Pensacola, Fla.; I. A. Silvie, Jr., Port Richmond, L. I.; Tuler Auto Company, Pueblo, Col.; J. S. Casey, Sacramento, Cal.; Kinsey & Danielson, Sherrard, Ill.; Shean Auto Station, Springfield, Mass.; Burnham & Body, Watseka, Ill.; D. & H. Auto Company, Wilkesbarre, Penn.; Gate City Garage, Winona, Minn.

Louis M. Baker has been appointed sales manager for Clarence N. Peacock & Co., for whom he will direct the sales of the Ames shock absorbers. Two years ago Mr. Baker established the Baker Rim Company and retains his financial interest in that concern, although he will devote his entire time to the Peacock company's business.

J. F. Richman, for the past four years superintendent of the Hudson Motor Car Company, Detroit, maker of Hudson cars, has joined the Cole Motor Car Company as factory manager. Mr. Richman is thoroughly experienced in factory management and has made an enviable record in recent years.

The International Motor Company, New York City, maker of Mack, Saurer and Hewitt trucks, has made some changes in the executive personnel. They were announced by Chairman W. C. Dickerman of the directors' executive committee, as follows: First vice president, John Calder; second vice president, L. H. French; third vice president, E. C. Fink; assistant to first vice president, F. R. Phillips; general sales agent, R. E. Fulton, assistant general sales agent, George H. Hodges.

The Hupp Motor Car Company, Detroit, maker of Hupmobile cars, has found it necessary to establish a parts depot in central Europe to meet the demands of European motorists. This depot has been established at Hamburg, Germany, under the direction of C. H. Dunlap, export manager of the company, and is in charge of George Chailley of Paris, who was secured by John L. Poole, the company's export manager at Paris.

The Kissel Motor Car Company, Hartford, Wis., maker of KisselKar pleasure cars and trucks, has appointed the following new agents: Rio Grande Auto Company, El Paso, Tex.; P. H. Harrington, Slayton, Minn.; H. E. Webber, Fergus Falls, Minn.; Central Auto Company, Faribault, Minn.; O. H. Taralveth, Warren, Minn.; F. P. Smith, Missoula, Mont.; Holmes Garage, Miles City, Mont.; C. H. Buford, Virginia City, Mont.; George W. Delisle, Walhalla, N. D.; Aberdeen Auto & Supply Company, Aberdeen, S. D.

The King Motor Car Company, Detroit, builder of King cars, announces the following dealers who have taken King agencies: Monroe Motor Car Company, Buffalo, N. Y.; Holsman Sales Company, Des Moines, Ia.; Miller & Williams, Los Angeles, Cal.; M. G. Beckner, Indianapolis, Ind.; Isaac Pepper, South Bend, Wash.; Barclay Auto Company, Minneapolis, Minn.; Tice & Lasley, Canton, O.;

Digitized by Google

Dyche & Duncan, Columbus Junction, Ia.; Diehl Motor Car Company, Medicine Hat, Alberta; King Motor Sales Company, Kansas City, Mo.

The Stewart Motor Corporation, Buffalo, N. Y., has appointed the following agents for the Stewart light delivery commercial cars: W. H. Heinzerling, Seattle, Wash.; Lougheed & Webster, Calgary, Alberta; George H. Hack, Saskatoon, Saskatchewan; M. Zilbermann, New Orleans, La.; Christiansen Company, Galveston, Tex.; Empire Automobile Company, Glens Falls, N. Y.; E. L. Jordan, Auburn, Me.; Syracuse Garage, Syracuse, N. Y.; John Van Benschoten, Poughkeepsie, N. Y.; Power City Auto Company, Niagara Falls, N. Y.; J. E. White, Jamestown, N. Y.

GARAGE AND DEALER.

The McAden Automobile Company, 106 Fayetteville street, Raleigh, N. C., has taken over the business of the Jackson Tri-State Motor Car Company, Louisburg, N. C., and will conduct it at Raleigh. The McAden company acquires the garage and accessory business and Jackson distributing agency for the same territory. R. Y. McAden is the sole owner of the company and has had many years' experience in the automobile business.

Samuel Weston Scott, who was for some time connected with the Boston branch of the Velie Motor Vehicle Company, Moline, Ill., maker of Velie cars, has joined the sales force of the W. H. Stevens Company, Boston distributor for National cars, made by the National Motor Vehicle Company, Indianapolis, Ind. Mr. Scott is well known in motor car circles and will make a valuable addition to the National force.

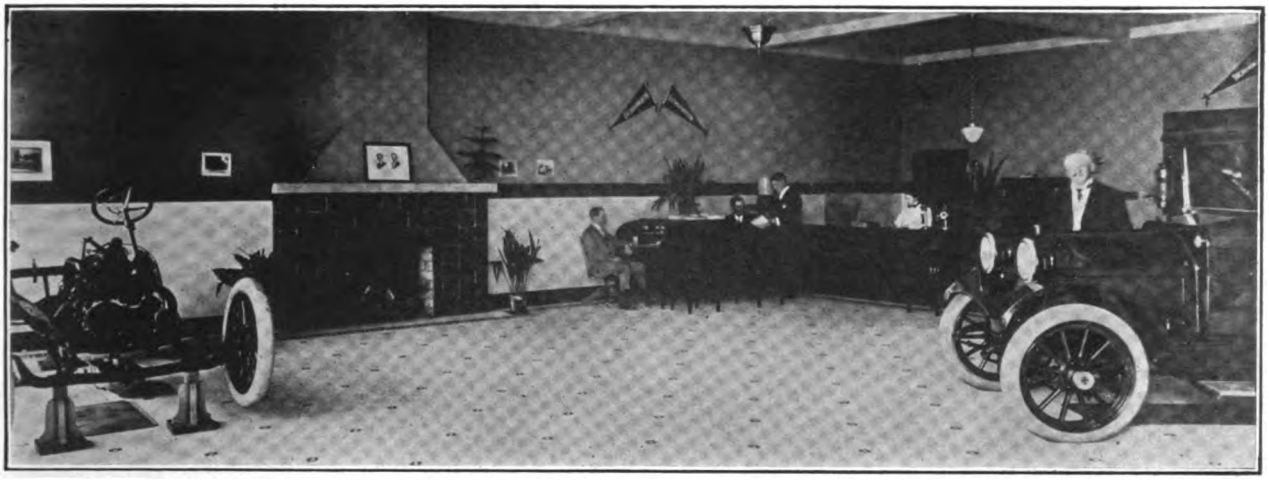
The Streuber-Mooney Company, Erie, Penn., and Buffalo, N. Y., has been formed to handle the sales of Keeton cars, made by the Keeton Motor Company, Detroit, for six counties, including Erie and five others in Pennsylvania, and six counties in New York State, including Genesee county, in which Buffalo is situated. The members of the firm are Lewis Streuber and Frank J. Mooney.

J. W. Willcox, Southern California distributor for Henderson cars, made by the Henderson Motor Car Company, Indianapolis, Ind., has occupied his newly completed garage and salesroom at 1053 South Olive street, Los Angeles, Cal. The building is one of the largest motor car structures in Los Angeles and is equipped with the most modern appliances. The accompanying illustration of the interior of the showroom indicates the excellent appointments now enjoyed by the Henderson.

The Detroit Auto Exchange has opened quarters at 676 Woodward avenue, Detroit, instead of at 292 Jefferson avenue, as at first intended.

The United Motor New York Company, New York City, has taken 20,000 square feet of floor space in the Galvin building at 13th street and East avenue, Long Island City, N. Y., for a service station. The latter can easily be reached by way of Queensboro bridge. Repair parts for Maxwell, Stoddard-Dayton, Brush, Everitt and Flanders cars and for Sampson trucks will be carried there.

C. W. Whitson and C. O. Usborne of Detroit have formed the Usborne-Whitson Sales Company to handle in Michigan the Keeton car, made by the Keeton Motor Company of Detroit. A large salesroom has been secured at 730 Woodward avenue, Detroit. Both men are well equipped by experience to handle Keeton sales successfully.



The M. B. M. Motor Company, Boston, Mass., a recently incorporated concern, has made final arrangements to handle the Maxwell car at 1116-1118 Boylston street, under the management of Charles Addison Malley, father of the present Massachusetts vehicle lighting law and other legislation of advantage to motorists.

E. R. Bennett and G. Lemaster have opened their garage at 113 North Main street, Ottawa, Kan., under the firm name of the Redlight garage. Modern machinery has been installed and a general automobile and repair business will be conducted.

R. A. Vos of East Saugatuck, Mich., has acquired the property formerly owned by the Holland Umbrella Company, Holland, Mich., and the building will be equipped for a first class garage, which Vos will conduct.

C. W. Evans and W. A. Rose have taken over the Boulevard garage at 29 Webster street, Brookline, Mass., and will conduct a general garage and repair business. A complete electric charging equipment has been installed and the firm will handle supplies.

The Garrett Garage Company, Wallace, Idaho, has started in business in a new garage on Pine street. The machine equipment is complete and shafting was installed of sufficient length to permit of extension of facilities from time to time.

Henderson Salesrooms, Recently Opened in Los Angeles, by J. W. Willcox, Southern California Distributor.

Johnson & Iverson Auto Company, Kiron, Ia., has established a repair shop in connection with its garage business.

The Schrup Motor Car Company, Dubuque, Ia., has leased four sections of the Conolly building on Seventh street, to be used as a salesroom for Premier, Locomobile and Studebaker pleasure cars and G. M. C. trucks. The four sections will be converted into one spacious room and the company will add a complete line of tires and supplies.

The Pittsburg Motor Service Corporation, Pittsburg, Penn., has opened a magnificent storage depot building, completely equipped for the care and maintenance of trucks, an institution that was badly needed in that city. Many business men failed to install motor equipment because of lack of storage facilities, but so fine an impression has the new building made that many of those already operating machines are said to be contemplating doing away with their private garages and availing themselves of its service. Pleasure cars can also be left there during the day instead of parking along the city curbs.

The Lawfer Auto Company, Allentown, Penn., is having its garage considerably enlarged to take care of increased business.

RECENT PATENTS.

Combined License Bracket—William A. Schleicher, Cleveland, O., No. 1,050,395. Two sliding brackets are so constructed that the end of one overlaps the other, permitting of increasing or decreasing the length of the license number holder. Provision is made for securing the number tag by means of a locking screw. The holder is integral with the bracket carrying the lamp.

Cushion Tired Wheel, Norman Gratz, Boise, Idaho, No. 1,056,167. A wheel tire, comprising an inner rim having radial side flanges, an outer rim composed of segmental sections having inwardly extending side flanges formed with radial slots, means for pressing the outer rim sections outward yieldingly, channelled cross bars secured to the side flanges of the inner rim and extending through the slots in side flanges of the outer rim, rollers carried by the cross bars and arranged in said slots, and with which said channels communicate, a lubricant receptacle and connections between the receptacle and the channel of the cross bars.

Life Saving Apparatus, Clayton E. Frederickson, San Francisco, Cal., and Ivy Baldwin, Alameda, Cal., assignors of one-half to William H. Stenger, Berkeley, Cal., No. 1,056,271. A portable body catching apparatus, mounted on a motor vehicle, comprising a bed frame, arms rockably mounted at each side of the frame, a crankshaft, devices connecting said shaft to said arms at each side of their fulcrums for swinging said arms inwardly and outwardly in a plane at right angles to the frame, and a flexible body connected at opposite edges to the side arms and adapted when the side arms are swung out to form a net or apron for receiving a falling body thereon.

Valve Gear, Daniel Appel, East Cleveland, O., No. 1,057,399. In combination with the crankshaft and cylinder of an internal combustion engine, a valve adapted to control, both the inlet and exhaust of gases from the cylinder, a valve rod connected to the valve, and a valve gear comprising a member which has a connection with the valve rod, and means for operating said member so as to impart to the axis of said connection a hypocycloidal path of movement.

Tire Patching Device, Gustave J. Martel, Chicago, No. 1,057,440. In a tire patching device, the combination of a flexible patching strap; angular yokes having one leg secured to the ends of said straps, the other leg being curved to fit a rim flange; securing hooks adapted to engage rim flanges and having threaded shanks extending through said yokes, and nuts on said shanks, substantially as described.

Sleeve Type Two-Cycle Engine, Clarence D. Miller, Philadelphia, assignor of one-third to Harry F. Haviland and a like amount to Warren J. Miller of the same city, No. 1,057,442. In an internal combustion engine, a cylinder having in its walls an exhaust port, a sleeve within said cylinder, said sleeve provided with a pair of ports located in different horizontal planes whereby upon the reciprocation of the sleeve in the direction of its axis, the sleeve ports will register successively with the cylinder port, to provide initial and final discharge of the exhaust gases.

Tire Filling Machine, Elmer Oliver, Daytona, Fla., No. 1,057,451. A machine for filling tires comprising a hopper, a feed screw operating therein, a feed pipe leading from the hopper outlet, a manually operable cut-off valve in said pipe, a pressure controlled valve in said pipe between the hopper and the first named cut-off valve.

Carburetor, Elbridge W. Stevens, Baltimore, Md., No. 1,057,506. A carburetor for internal combustion engines, comprising a vertical tubular mixing chamber, a float feed, a throttle valve between the mixing chamber and the outlet to the engine cylinder arranged on a horizontal axis transversely to the mixing chamber, a rotary auxiliary air valve below the mixing chamber arranged on an axis longitudinally to and within the mixing chamber, a needle valve for fuel injection between the two arranged inclinedly and at an acute angle to the axis of both said valves and connections for all three said valves for operating them with a simultaneous and conjoint action.

Gear Shift Lever Device, Phares W. Brubaker, West Reading, Penn., No. 1,057,524. A lever working within a slot, one side of said slot being provided with a flexible portion, means for converting said flexible portion into a rigid portion, and means whereby said flexible portion controls the movement of said lever.

Vehicle Wheel, Thomas B. Jeffery, Kenosha, Wis., and Kate E., Charles T. and Harold W. Jeffery, executors, No. 1,056,278. In a vehicle wheel, the combination with the spokes thereof, a two-part spoke head secured to the end of each spoke, flanges on the upper ends of the two parts of each spoke head forming a dovetail channel between the same, a tire rim removably surrounding the spoke heads, dovetail lugs on the inner surface of the tire rim engaging the dovetail channel in the spoke heads and means for forcing the flanges on each spoke head toward each other and against the interposed lug.

Lamp Lighter and Controller, William C. Hamilton and William Lee Bird, Indianapolis, Ind., No. 1,057,638. A lamp controlling valve comprising a body having supply and delivery passages, a valve mounted in said body and controlling communication between the supply and delivery passages, a diaphragm chamber having a supply passage controlled by said valve, a diaphragm in said chamber, an exhaust passage co-operating with the valve to intermittently exhaust the diaphragm chamber, and an electric circuit terminal controlled by said diaphragm.

COMING EVENTS.

BROOKLYN'S AUTOMOBILE SCHOOL.

Features Which Helped to Give It an Enviable Reputation in This Field.

The automobile school conducted by the Bedford Branch Y.M.C.A., Bedford avenue and Monroe street, Brooklyn, N. Y., is one of the oldest in the country, having been organized in January, 1908, and it is one of the largest and best known. It graduates over 600 students a year, many of whom are owners or prospective owners, while others are garage mechanics, chauffeurs, salesmen, etc. Several are now holding responsible positions in the industry, a large percentage of these having been secured through the efforts of the school in behalf of the men.

The equipment is thoroughly in keeping with the reputation of the institution, the latest feature of automobile design and fittings being added as fast as their practicability has been established. Four and six-cylinder engines are kept in working order so that the students may wire, adjust and operate them; all types of ignition systems, both magneto and battery, and all kinds of carburetors, both mechanical and automatic, are utilized; even a 1913 electric motor starter is included, making everything complete and up-to-date.

The course recently has been lengthened to 17 three-hour shop sessions, in which everything is thoroughly explained, and the men have full opportunity to gain experience in taking off cylinders, grinding valves, replacing tires, adjusting carburetors and handling troubles of all sorts. After completing the shop work the men are given instruction in driving, in which the latest types of cars, both pleasure and commercial, are used. This comprises from eight to 12 one-hour lessons, covering from 100 to 150 miles.

A very interesting feature of the course is the Friday night lecture, for which the whole school assembles once a week to hear some expert. These talks often are illustrated with stereopticon views, and the men have opportunity to hear engineers who stand at the very forefront of their respective lines.

An accompanying illustration presents some of the instructors, the full list being as follows: Supervisor, Prof. Carl F. Schulz, M. A.; shop teachers, Prof. George Meyerhoff, M. E.; John Lettenberger, Jr., H. D. Webster and Frank Berry; road instructors, Frank Exner and W. Davies; registrar, W. G. Benjamin; school office assistant, John F. Ryan. Messrs. Schulz, Lettenberger and Berry are members of the Society of Automobile Engineers.

Faculty of the Bedford Branch Y. M. C. A. Automobile School: Left to Right, Standing, John F. Ryan, Frank Exner, Prof. George Meyerhoff, H. D. Webster, W. C. Benjamin; Sitting, John Lettenberger, Jr., Prof. Carl F. Schulz, Frank Berry.

Automobile speed records between Pittsburg and Philadelphia were reduced by more than three hours, when L. B. Ebb, driving his Packard car, made by the Packard Motor Car Company, Detroit, covered the distance in 10:12:00, elapsed time, defeating J. Fred Wren, in a Mercer, by 1:10:00 and winning a side bet of $1000. The racers left Pittsburg at 6 in the morning and Ebb registered at the Bellevue-Stratford hotel, Philadelphia, at 4:12 in the afternoon. Wren registered at 5:22. Ebb reported his actual running time as 7:15:00.

Emil Grossman, maker of Red Head spark plugs, offers a cash prize of $500, payable in weekly installments, to the winning driver in the Memorial Day, 500-mile international sweepstakes race on the Indianapolis motor speedway, providing the car uses spark plugs of this make exclusively.

Brown Scientific Tube—The Ultimate Tube

SIMPLE IN CONSTRUCTION BUT SCIENTIFIC IN PRINCIPLE

WILL NOT DEFLATE WHEN PUNCTURED

Contains more than double the amount of rubber in ordinary tubes. Adds one-third to the life of the casing, due to the reinforced tread, which permits casing to wear practically through. THIS SPELLS ECONOMY.

Used and endorsed by leading merchants of New York and other cities.

Among our users and buyers are 14 of the most prominent manufacturers of motor cars.

Being an AIR FILLED TUBE, it does not interfere with the guarantee given by tire manufacturers.

GOODYEAR
AKRON, OHIO

This name on Automobile Tires and Rubber Accessories signifies inherent qualities of material and workmanship that insure the maximum of service at the minimum of expense.
THE GOODYEAR TIRE & RUBBER COMPANY, AKRON, OHIO (673)

"There's Where YOU Are Wise!

That Other Fellow is a Menace to Everyone's Safety"

Nine-tenths of all automobile accidents are caused by skidding and by foolish dependence on rubber alone. In these days of crowded streets and congested traffic, the motorist who does not take precaution to guard against every possibility of disaster is ***next to criminal.***

"The ever-present danger that is quite as much of a terror to the experienced driver as it is to the novice is **skidding.** There is nothing that makes a man lose his nerve so thoroughly or dread a repetition of the experience so keenly as a bad skid that ends in a broken wheel against a curb, or that makes matters far worse by 'side-swiping' a moving trolley car. To feel the car start to slide from under you, aiming directly at the nearest obstruction, despite all manipulations of the wheel and brakes---well, once is too often."

Slipshod Traffic

Traffic policemen, by the hundreds, interviewed in all the large cities throughout the country, express the unanimous opinion that their work would be **greatly reduced; that nearly all skidding accidents would be eliminated** if motorists would take the precaution of always carrying WEED CHAINS, and putting them on when the roads and pavements are wet, slippery and uncertain, or covered with snow.

Some of these **guardians of public safety** go so far as to say that the time is not far off when State Legislatures will make the use of **WEED CHAINS compulsory,** for the protection of life and property.

Make Safety Yours

Take no chances. Fully equip your own car with WEED CHAINS and **insist,** for your own protection, that other drivers do the same.

On the Rear Tires

they afford perfect traction and adequate brake control.

On the Front Tires

they act as ladders to enable the front wheels to easily climb out of mud-ruts, car tracks and all uneven places in pavements or roads, always insuring absolute steering control, eliminating all chance of the front wheel skid.

If you haven't a set of **WEED CHAINS,** or if you have a pair for the rear tires only, **get a full equipment now.** Delay is dangerous. Stop at your dealers today and **WEED CHAIN** your car to safety.

Are You Having Trouble With Your Brakes?

Would you like to make YOUR brakes safe, sure and certain?

The most important factor in any automobile is the brakes. The brakes in turn are dependent on the lining. If you've had trouble—if you NOW have, write us. We'll be glad to assist you in making your brakes safe. We are brake experts. We know more about brakes and brake lining than anyone else because we make the subject a study. Above all things, be sure YOUR brakes are lined with

TRADE MARK **Raybestos** REG. U.S. PAT. OFF.

"THE ORIGINAL AND BEST ASBESTOS BRAKE LINING"

Here is a REAL brake-lining. The minute your brakes are lined with RAYBESTOS you can go anywhere, anytime with absolute safety and freedom from brake trouble because RAYBESTOS stops ANY car instantly. It's the lining that made the automobile safe—name stamped in every foot for your protection.

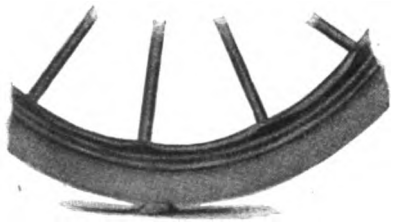
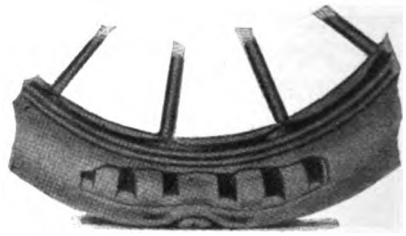
You can get the whole idea of

Dayton Airless Tires



and why they ride smoothly from three pictures and three short paragraphs; here they are:

When a pneumatic tire strikes a stone—



the stone sinks into the tire, air is displaced and the tire passes over the stone with a certain vibration or bounce GREATER, however, than the Dayton Airless.

When a solid tire strikes a stone—

the stone cannot sink into the tire because there is no place for the rubber to "go" or expand into, except on the outside, which is not sufficient, hence, inasmuch as the tire will not yield to the stone, it rides up over it and drops down with a sharp jar or jolt, causing great damage to the mechanism of the car.

But when a Dayton Airless strikes a stone—

the stone sinks into the tire, rubber is displaced and the pier or column of elastic high grade rubber squeezes down and bulges out into the open spaces between the piers and the tire passes over the stone with a very slight vibration or bounce.

You'll want more facts—more proofs and evidence; we've plenty of it; write today for our "Catechism" a book that shows the way out of tire trouble.

Read this reminder now: Dayton Airless Tires must not be mistaken for solid or "filled" tires; they fit all clincher rims; they're made in non skid and smooth tread

DAYTON RUBBER MFG. CO., 1011 Kiser St., Dayton, Ohio

20 Miles to Gallon

Lawrence, Mass., July 13, 1912.
Gentlemen:—Enclosed find check for carburetor. I feel perfectly satisfied. It does 20 miles and over on a gallon. Can recommend it to anyone. G. A. Schmidt.

19 to Gallon on Cadillac

Edgewater, N. J., May 21, 1912.
Planhard Co.:
I am very much pleased with my new Planhard Carburetor. I made a test of gasoline consumption from Edgewater to Hyde Park, N. Y., and return, and got a fraction over nineteen miles to the gallon. This is on my Cadillac.
John H. Hinners.

More Speed—Start Cold

Groton, Conn., Feb. 8, 1913.
Dear Sirs:—I put a Planhard on my single cylinder 6-8 h. p. Goshen engine. It gives 50 R. P. M. more than the ——— I took off. With the Planhard I can start cold or hot without priming, which few others can do.
Yours truly, E. A. Scriven.

3¾ More Miles

When Planhard Carburetors were put on the 6 cylinder, 4 cycle Frisbie motor of the fast boat Delphi II, she increased 230 R. P. M., and 3¾ more miles per hour.

Much More Power

Bath Marine Construction Co.—"The gasoline consumption at normal power was better than others and it would develop much more power when pushed." H. D. Bacon, President.
"Fifty miles without a miss."—Geo. E. Grosvenor, Crescent, Mich.
"To use the vernacular, 'some carburetor.' "—W. R. Fleming, 3311 Broadway, N. Y.

If you own a FORD!

Chicago, Ohio, July 1, 1912.
Gentlemen:—The Planhard Carburetor for my model S Ford Car is very satisfactory. I never bought anything for my car I paid so cheerfully for, as I have a smoother running engine with more power and get *more mileage per gallon* and my engine runs much cooler.
H. W. Grandon.

Gallon Less Per Hour!

Patented Europe

Try the M&M Economizer

For SPEED, POWER and ECONOMY

STEERING WHEEL CONTROL

Patented America

ECONOMY! The M&M is positively guaranteed to save from 40 to 50 per cent. of GASOLINE.

SPEED and POWER! The M&M is also guaranteed to increase the SPEED and POWER 20 per cent., WITH LESS GASOLINE AND LESS CARBON.

The M&M Economizer is made with one ground valve and six portholes, which when open, admit auxiliary air into the manifold. This will give you a uniform mixture, which is POSITIVELY NECESSARY to obtain Speed and Power. It is controlled by either friction foot pedal or steering wheel control. It requires a ¾" pipe tap to insert into manifold, but same can be reduced to ½" if necessary. The motorcycle size is ¼".

The M&M is the only known carburetor adjuster on the market, and can be used for priming the engine. It is also a safety valve in case of back-fire, and one of the greatest carbon eliminators on the market. With the throttle set at 12 miles per hour, by opening the M&M, your mileage will be increased to 18 or 20 miles, with the same amount of gasoline, and less carbon. What the Coaster Brake is to the Bicycle the M&M is to the Automobile going down grades.

READ THIS LETTER! Then watch for the next.

Harrisburg, Penn., March 3, 1913.

Moller Brothers, Philadelphia, Penn.:

Gentlemen:—Concerning the satisfaction given us by the M&M Economizer, we want to say that we have been enthusiastic users of the M&M from the very first, and that was when they were not perfect. The ones put out later are all that anyone can desire, and we think that anyone that does not equip their car with this device is very foolish. We firmly believe that if the automobile public knew the advantage of the M&M Economizer, there would be one placed on every car used. We have been able to get from four to six miles more from a gallon of gasoline. Yours Very Truly,

HARRISBURG AUTOMOBILE CO.

(Signed) Geo. G. McFarland.

The M&M Economizer will positively do what we claim, or money will be refunded in 30 days. (Reference—Citizens National Bank, Lewistown, Pa.) No dealer or jobber is authorized to sell without giving this guarantee.

Price of the automobile Economizer $3.50—17c extra for postage. (Complete with either foot pedal or hand control.) Price of the motorcycle Economizer, $1.25 prepaid.

Send for our catalogue.

BEWARE OF INFRINGEMENTS!

The M&M is the ONLY PATENTED air valve of its kind, placed between the carburetor and cylinders, on the market.

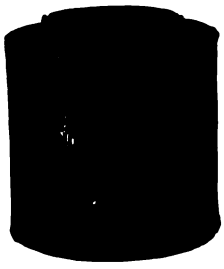
The Repair Man Who Gives Good Advice

No one knows better than the mechanic in the repair shop that POOR LUBRICATION is the cause of worn out bearings and gears, and though NEEDED REPAIRS are the basis of part of the repair man's business, *preaching*, *practicing* or *providing* poor lubrication is the last thing he would think of doing.

His prosperity is built upon honest service, upon honest advice and honest workmanship. He gets more thanks, more good will and more business for his help in *minimizing* repairs than he does for his skill in *making* repairs.



The repair man who points out lubricating mistakes and advises the use of

TRADE MARK REGISTERED IN

The "Black Eagle" Spark Plug

PATENTED

50 Cents Is Enough

The "Black Eagle" Spark Plug has made good because it was designed and manufactured with this result in view.

A person in close touch with the supply and manufacturing ends of the trade was a visitor at our factory recently, and was shown the details of construction, including the machinery, testing, and assembling of the "BLACK EAGLE" Spark Plug. What he said we believe will be of interest to you, as it indicates the effort on our part to supply a high grade plug at a reasonable price. We therefore quote below his impressions.

"I am simply amazed at the workmanship, material, and construction of the 'BLACK EAGLE' Spark Plug. When I saw this plug advertised at a price of 50c to the consumer, I naturally supposed it was a cheap, common, plug such as you occasionally find in jobbing houses on the bargain counter. I am convinced, after seeing these plugs tested, and examining minutely the machine parts which enter into their construction, that **no better porcelain spark plug is offered by any one, regardless of the price they ask.**"

We are not **influenced** by what our competitors **charge for spark plugs!** We have **ignored price precedent,** for the reason that a **high grade spark plug** can be manufactured and sold at **50c each, and that is enough.**

Sent prepaid on receipt of price. Made in all standard threads.

YOUR spark plugs can make or mar the efficiency of your car. You can't be too careful in your selection of them for they are the Keystone of the ignition system.

"Locating the Spark Plug" tells you all you should know about plugs; tells it in a way you can understand and profit by. In addition, it tells you about a perfect spark plug, the kind you need in your engine.

Our Exclusive Feature

We will (at small extra cost) furnish our Regular Models with the

AUSTIN

Two-Speed Axle

This axle provides two different gear ratios, both on direct drive, and in combination with a three-speed transmission gives six speeds forward and two reverse.

Model "77" has a Regular Direct Drive of 3 1-2 to 1, and a Special Direct Drive of 2 to 1.
Model "55" has a Regular Direct Drive of 4 1-2 to 1, and a Special Direct Drive of 3 to 1.

The Regular Direct Drive provides ample power and exceptional ease of control for hills, bad roads and crowded city traffic.

The Special Direct Drive for normal conditions, shows a gain of over 50% in mileage for the same fuel consumption and motor speed, eliminates the noise, wear and tear of running the motor at excessive speeds, adds materially to the life and durability of the car and pleasure of riding.

Model "77" Six Cylinders, 4 1-2 x 7 - - $6000.00
Model "66" Six Cylinders, 4 1-2 x 5 1-2 - - $5000.00
Model "55" Six Cylinders, 4 x 5 - - - $4000.00

MORE NEW, IMPROVED and **DISTINCTIVE FEATURES** than any other car. Two-speed rear axle, high pressure air self-starting system, complete electric lighting system, left hand steer, center control, two-spark magneto, four-speed transmission, both brakes controlled by foot pedals.

Write for complete description and any information you may desire in regard to our two-speed axle.

FACTORY RUNNING FULL BLAST

DAYTON

The construction does it

Look at this illustration; it shows you clearly the whole principle of the Dayton Airless Tire. This "bridge" idea gives you easier riding (far more resiliency), less shock, than the best pneumatics.

It must do that to be of any real use to you. And with this greater resiliency also comes the one great thing you get only with the Dayton Airless: absolute freedom from tire troubles.

"Air free—care free"

Here is this wonderful tire that not only rides easier than the pneumatic, but lets you start on the longest, hardest trip in complete piece of mind. Without compressed air you are without punctures and blow-outs; you are without all the possibilities of danger, delay, annoyances and expense—trouble piled on trouble. Dayton Airless Tires are going to give you this greater freedom, this independence of bad luck.

The Dayton Airless is the big step of this generation in tire making. It marks the longest advance of any part of the great sweep of progress in automobile manufacture. The development and final perfection of this tire means the end of their worst troubles to thousands of motorists.

Best of all, it is possible to sell it to you at very little more than the air-filled tires. This difference is nothing when you consider that we give you a 5000 mile guarantee ($8000 on Ford and other light cars); that you don't have to carry extra tires, casings, etc.; that expense is over.

If you will send for our "Catechism" you'll be taking your first step towards the best motoring season you have ever enjoyed. Ask us to prove these things to you; it's better than getting misinformation from people who don't know.

To Agents

Write us about territory for this practical sure-selling line of tires.

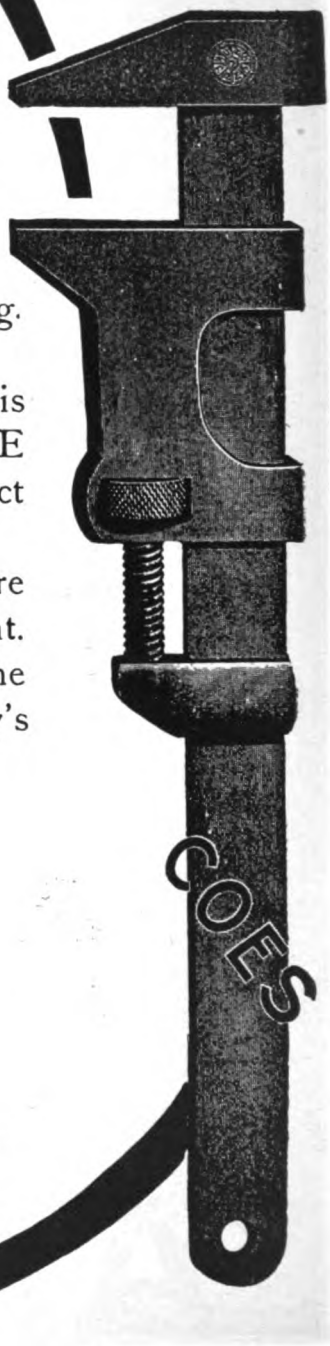
COES



THE
Wrench Supreme

Strength without bulk or clumsiness.
Ease of handling without slipping or bruising.
Perfect balance and right grip

Everything the motorist desires in a wrench is to be found in the "COES" AUTOMOBILE MODEL, and you will never know perfect wrench service until you pin your faith to it.

It stands to reason that the 5 per cent. more you pay for a "COES" wrench goes for 60 per cent. more quality and service—put this wrench in the tool kit and shop. You will get your money's worth.

Starts — Lights — Ignites

REMY

Six Volt System-Does-It-All

WE do not furnish the same electrical system for all cars, but a reliable, efficient apparatus in combination for each car. This apparatus fulfills the logical desire of every motor car owner—to have one factory, only, responsible for the efficiency of all the electrical equipment on his car.

Remy silent, simplified starters are the simplest form of ball bearing series motors. They are wound to produce an enormous turning power. The requisites of each make of car are carefully analyzed by Remy experts. Such a policy insures a proper sized starting motor for the particular car. Thus the relation of each Remy starting motor to the car motor is so accurately gauged that a failure is impossible.

This accurate relation of starting motor and car motor eliminates all current waste. A common size starting motor for all car motors is ridiculous.

Remy Slow Speed Protected Generators produce sufficient current to carry the car lamp load at ten miles per hour. If the car is driven faster the output decreases as the speed of the car increases but never decreases below a determined value. Therefore, the battery is kept charged at a non-injurious rate. This current regulation is obtained inherently or in other words without automatic devices of any kind, no slipping clutches, relays or controllers.

The Remy magneto is manufactured for all classes and types of gasoline engines. It has been manufactured for fourteen years. In each of these fourteen years the demand has grown until the present year sees more Remys in use than all other makes combined. It is today the standard magneto of America.

See that your car is Remy started—Remy ignited—Remy lighted.

Remy starting and lighting equipment is sold only to car manufacturers. Write us about our Magneto Exchange offer. Liberal allowance for any make of old equipment.

No-Rim-Cut Tires 10% Oversize

No Petty Saving

Goodyear tires have become, in late years, the greatest sensation in Tiredom.

They far outsell all others. The demand has multiplied so fast that last year's sales exceeded our previous 12 years put together. This has not come about, as you must know, through any petty saving.

We Did This

We brought out the No-Rim-Cut tire, which we still control.

With old-type tires, rim-cutting ruined 23 per cent. This new-type tire wiped out that loss completely.

Its 10 per cent oversize, with the average car, adds 25 per cent to the tire mileage.

These two features together have saved tire users a good many million dollars.

Also This

We compared, by actual mileage, 240 formulas and fabrics to learn which served the best.

We compared by mileage, every material, every method and process.

We devised machines which give to every inch of every layer exactly equal tension.

We employ a curing process, very unusual. It adds to our cost this year about one million dollars—just to add more mileage.

And we spend each year, in learning ways to better tires, about $100,000.

That is Why

That is why the Goodyear tire holds top place in Tiredom. Legions of men have proved by meters its immense economy.

You can prove it in the same decisive way. You can see that these tires can't rim-cut. You can see the oversize. And you can see by mileage figures what they save on upkeep. Do this. The savings are too big to miss.

How the KisselKar is defended against vibration—the arch enemy of a motor car

Two kinds of vibration constantly attack an automobile—*road* vibration and *engine* vibration.

Vibration will crystalize metal and make it brittle It will shake open joints, it will make its irresistible attack on every part of the car.

In two ways a car can be defended—first by eliminating vibration as far as possible; second by employing Chrome Vanadium steel at points of vibration and strain.

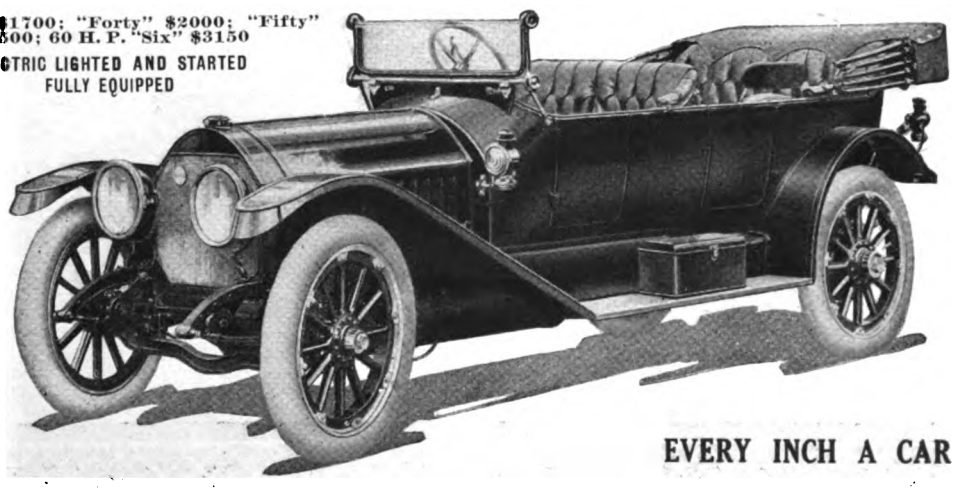
Road vibration is due to inequalities of the road and the KisselKar's defence against it is the extra liberal wheelbase, every extra inch of which modifies vibration. Then come the big wheels and tires—the springs especially resilient because designed according to the weight of *each* model—also the shock absorbers. Road vibration has little chance of reaching a vital part of a KisselKar.

Chrome Vanadium steel is used at all points exposed to vibration and strain. Chrome Vanadium steel is crystallization-proof. It is analyzed in the KisselKar laboratories and heat-treated in KisselKar furnaces, and is uniformly the highest grade material put into any automobile.

KISSELKAR

KisselKar Service takes the mechanical side of motoring off your hands. It keeps your car "tuned"—and an automobile, like any other machinery, has much greater lasting quality when always run in perfect condition, than it has when run with little things out of adjustment.

In other words KisselKar Service is extra assurance of a long life to your car—a guarantee of completest pleasure. It modifies running cost, and retards depreciation. Specially equipped buildings are in all principal cities to serve KisselKar owners.



Let us prove to you the superior value of the KisselKar and the advantages of KisselKar Service. The KisselKar catalog fully describes the complete KisselKar line.

For economical delivery, investigate KisselKar Commercial Trucks
1500 lbs., 1, 1¼, 2, 3, 4, 5 tons.

Next Year's Cars

By R. E. Olds, Designer

Next year's cars at every price, will have left-side drive, like the leading cars of this year.

They will have the set-in electric dash lights, while some cars this year still retain the old projecting lamps.

They will be over-tired, where some cars this year are vastly under-tired.

In next year's cars you won't find levers blocking one front door. The driver will enter from either side, as he does now in Reo the Fifth.

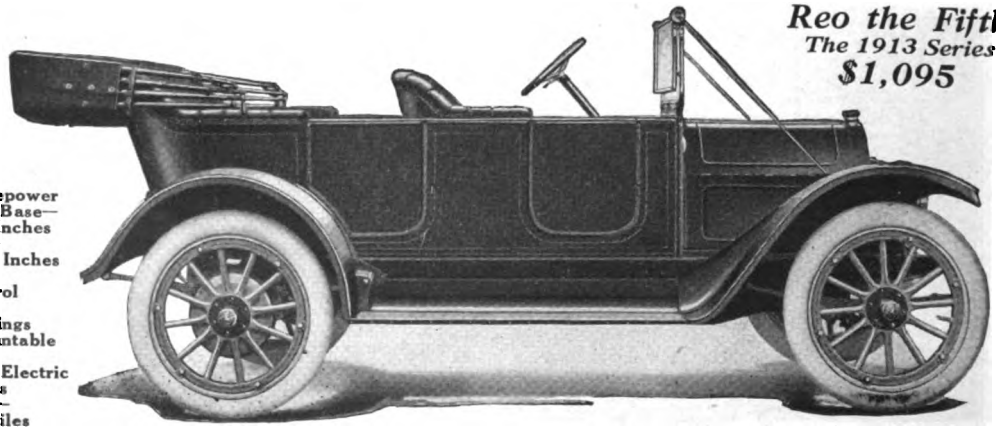
Next year's cars will be better built than many cars of this year. Men are learning that skimpy cars don't pay.

They will use roller bearings instead of ball bearings. They will use far more drop forgings.

In Reo the Fifth of this year we use 15 roller bearings and 190 drop forgings.

And next year's cars, like Reo the Fifth, will have doubly-heated carburetor.

These are coming features. What the leading cars use this year, most cars will use next.



The right-side drive, the projecting lamps and the skimpy tires will then be out-of-date.

Consider these facts when you buy a car. And note that Reo the Fifth, as sold this year, has all these new features in it.

Please write for our catalog, then see this car at the nearest Reo showroom.

F & S Ball Bearings

—this is it!

F & S
Blue Ribbon Retainer

THIS separtor is formed from a patented, one-piece, unit sheet steel stamping, drawn and formed without joints, welds or rivets in its construction. The separator itself is heavily corrugated and ribbed on one side for added stiffness, and finished in gunmetal blue; it is light in weight and frictionless.

It permits of unlimited high speed and vibration, besides which the retainer cannot be affected by heat.

The new retainer permits the use of larger balls, and in many of the sizes, a larger number of balls, which has always been a predominant feature of F. & S. ball bearings of every type on account of their transverse side entrance ball filling slot construction on the inner and outer rings on one side.

A Standard Library of Automobile Mechanical Information

There are 10 books in the series—800 pages of text—1500 illustrations—all fully indexed. Each book has been thoroughly revised and its contents have been brought right up to the minute. The subjects have been treated in a simple, non-technical manner, making the discussions as valuable to the novice as the engineer. Eighty per cent. of the automobile and technical schools in the United States and Canada use these works as text books, and more than 500,000 copies are sold annually. No similar expositions are to be compared with them—regardless of price. Every car owner and operator should have the full set.

Knowledge of your car means additional pleasure in its use and decreased cost in operation and maintenance. The practical instruction that you need is to be found in these books, and to acquire the same fund of information in any other manner would require years of constant study. You must understand your motor if you would adjust or repair it. The subject is fully treated in the Engine book. This applies as well to the Magneto, Carburetor, Battery, Lighting, Chassis and Tire books. When overhauling and rebuilding, read that discussion. The book on Motor Car Operation covers that subject with reference to all cars. No matter what the need, there is a book to meet it. No car or component is neglected, and all standard engines, magnetos, carburetors, batteries, lighting systems and vehicles are dealt with. The full set includes:

Engine	$ .35	Motor Car Tires	$ .25	Magneto	$ .35
Carburetor	.35	The Motor Car Chassis	.25	Motor Car Operation	.50
Lighting by Electricity	.50	Motorcycle Construction, Care and Repair	.35	Overhauling, Rebuilding and Repairing	.50
Battery	.35				

Full Set, 10 Books.....$3.75

PLEASURE AND COMMERCIAL CAR SPECIFICATIONS

We are publishing separately and in book form detailed mechanical specifications of all makes and models of pleasure and commercial vehicles. Every day in the year you have use for such mechanical information. You are constantly asking for constructional facts in connection with different makes of cars and as constantly confronted by similar questions from hundreds of other owners. With these forms in your possession you can learn in a moment any mechanical detail you wish to know.

MOTOR PARTS CO.
OFFICIAL BOSCH DISTRIBUTORS

We carry at all times a full and complete line of all Bosch Ignition systems and Plugs. Our replacement department is at your immediate service for the duplication of all Bosch parts.

CONSULT US ON YOUR IGNITION PROBLEMS

Zenith Carburetor

Operates perfectly from lowest to highest speed on various grades of fuel, and is not affected by altitude—needs no adjustment. No springs to weaken, no valves to bind, no pistons to get loose. The compound spray nozzle gives motor constant mixture at all speeds—all air goes through the spray nozzle.

Leak Proof Piston Rings

Insures perfect compression, makes leakage a mechanical impossibility. No wasted power. They decrease Carbonization and black smoke by keeping back surplus oil. Made in all sizes for all requirements. Not necessary to make alterations in piston.

MILLER WRAPPED TREAD TIRES

Miller One-Cure Wrapped Tread Tires represent the most economical tire on the market today. By their exclusive process of construction they give the car-owner 25% more mileage, 25% more durability and 25% more Safety and Economy.

The Miller method of production keeps all weaknesses out of the tires, the finest materials and construction certified by inspection before and after completion guarantees the best produced.

Dealers—

What kind of a tire do you want to handle?

Pick out the features you would like to have in the tire you handle. You want it to give generous mileage. You want it protected against rim cuts—to be full rated size—to be easily manipulated—to be widely known and well advertised.

These are the things that will largely determine the size of your tire business. But fully as important, you want the tire you handle to be made by a representative Company—a Company that holds out big future prospects to the dealers who handle its product—

Measure up this ideal tire against every other tire on the market and then compare it with United States Tires.

You will find United States Tires combine all these identical features of your ideal tire in a way that no other tire on the market approaches.

United States Tires

Today yield an average mileage from 25 to 50 per cent. above the highest point ever reached by any tire maker previous to the organization of the United States Tire Company.

No tire has ever been made as flexible or as resilient as the United States Dunlop.

This is the first and only tire that has ever been absolutely guaranteed against rim cutting.

It is by long odds the easiest tire to put on or take off—yet it can't possibly come off the rim until you are ready to take it off.

And moreover United States Tires are made by the most representative Tire Company in the world—a Company that offers its dealers the local prestige that naturally comes from handling America's predominant tires and the most definite assurance of a big steadily growing business in the future.

UNITED STATES TIRE COMPANY

New York

United States Pneumatic Tires are guaranteed when filled with *air* at the recommended pressure and attached to a rim bearing either one or both of the accompanying inspection stamps. When filled with any substitute for *air* or attached to any other rims than those specified, our guarantee is withdrawn.

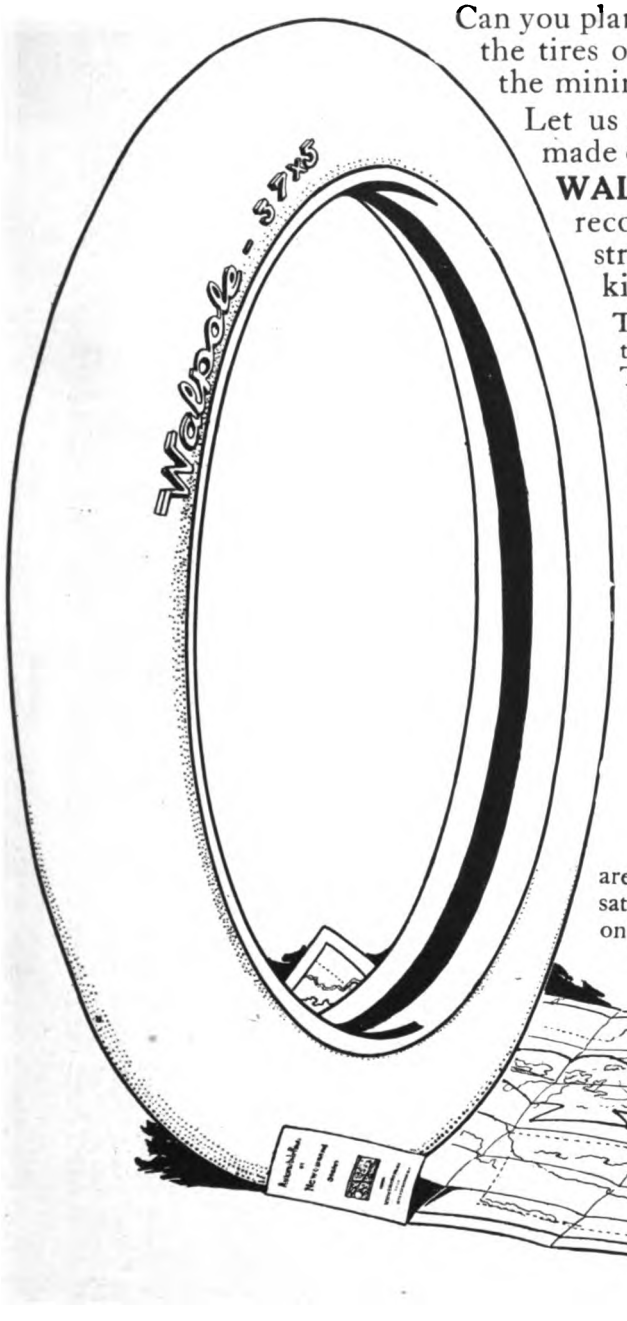
Will Your Tires Stand the Trip?

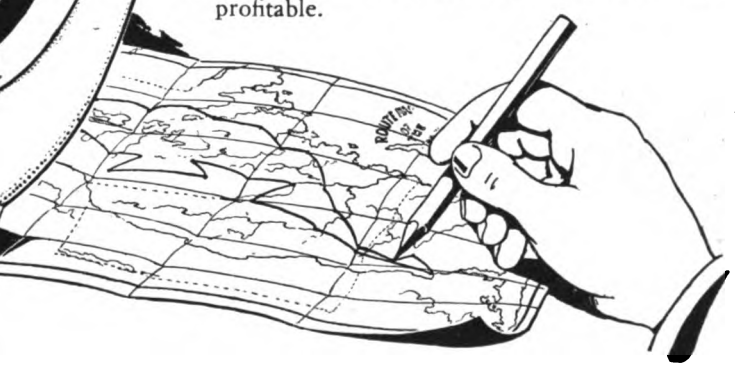


Can you plan a long, hard tour with confidence that the tires on your car will carry you through with the minimum of trouble and expense?

Let us ask you to investigate the tires that are made especially to stand the test of hard touring.

WALPOLE TIRES have made unparalleled records because they are scientifically constructed to withstand grinding wear on all kinds of roads.

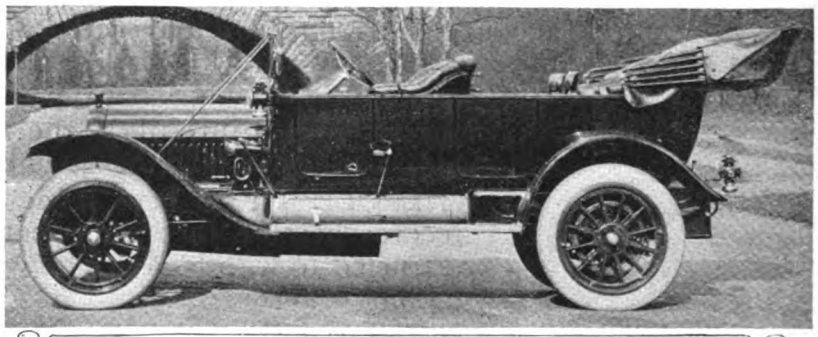
They have extra heavy side-walls and extra tough tread that absolutely protect against stone bruise. They eliminate that hidden breakage of fabric which is the source of 90% of blow-outs and the most frequent cause of tire damage.



They add thousands of miles and months of service to the life of a tire. They lessen the tire expense and, more important still, they greatly lessen the bother and trouble of fussing with tire changes and repairs.

Walpole

"NO STONE BRUISE" Tires



are an investment in service, in mileage, and in tire satisfaction. Let us put before you facts and figures on **WALPOLE SERVICE.** You will find them profitable.

WHITE SEVEN PASSENGER SIX
Electrically Self Started and Lighted

WHITE CARS

Include All of the Improvements Which the Purchaser Should Insist Upon Obtaining in a High-Priced Car

The discriminating purchaser should protect himself against the possibility of his car becoming obsolete in design shortly after his investment.

It is not enough that the car he chooses measures up to the prevailing standards of the day. Undue depreciation is bound to occur unless the car embraces every one of these fundamental features of design:

Left Side Drive—Right Hand Control—Electrical Starting and Lighting
Long Stroke, Economical Motor—Monobloc Cylinders—
Four Speed, Selective Transmission.

To purchase a car that does not have every one of these important features is to purchase a car that is already practically obsolete.

White cars have possessed every one of these up-to-date, practical features for two years. In White Cars the protection of your investment is unquestioned for years to come. The superior value of White Cars is therefore evident.

And White Owners Know It

Gasoline Motor Cars, Trucks and Taxicabs

THE AUTOMOBILE JOURNAL

VOL. XXXV, No. 7 MAY 10, 1913 Price, $1.00 the Year

HOW TAR MACADAM HIGHWAYS ENDURE.

Those Built with Refined Binding Material Last Year in the Rhode Island State System, the First Construction of the Kind, Show Marked Resistance to Combined Heavy Traffic and Unusually Severe Winter.

THE State of Rhode Island last year added 57.25 miles of bituminous macadam to its mileage of improved roads. Of this mileage 35 miles was new construction from the base up, the remainder was bituminous surfacing consisting of the application of two inches of bituminous mix over an old macadam. A considerable area of the resurfacing developed into a thorough reconstruction, as it was found that in many cases the old macadam was so thoroughly worn out that nothing was left to properly support the resurfacing.

Beginning of State Road at Rumford Station, East Providence, R. I., Built in 1912, Old Unimproved Way in the Foreground.

In The Automobile Journal of July 25, 1912, was given some little description of the methods used in the extended work undertaken by the board of public works. In the present article are given illustrations of the completed roads, which were last year shown under construction.

In Europe, highways have been built and maintained by the national governments for a century and a half. They were a military necessity and the government undertook the financing and the construction of highways. In France especially the system has been worked out in great detail and the cost of each road is paid for by the central government

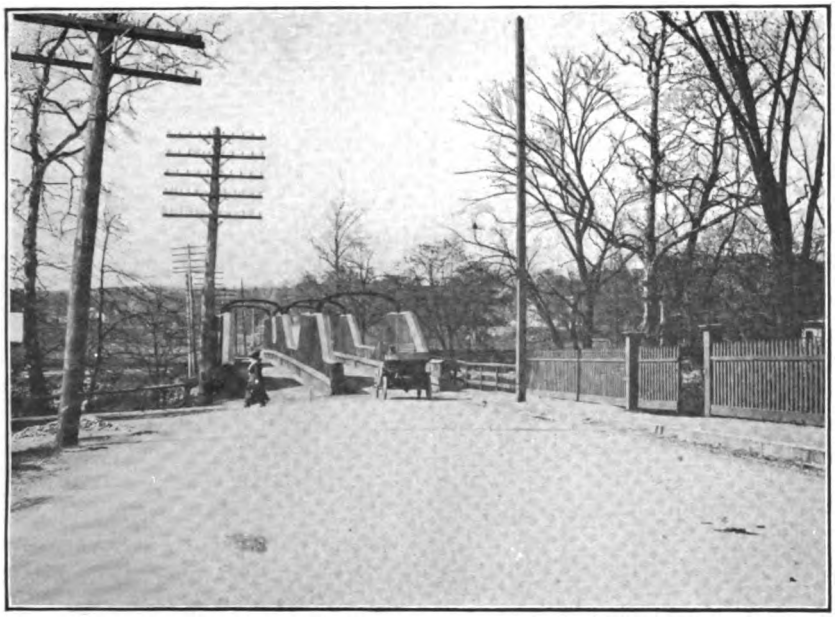
Digitized by Google

Nayatt Road, Barrington, R. I., Built with Tarvia in 1912, Showing the Heavy Character of Traffic on This Highway.

directly in proportion to its military value.

In the United States, military considerations have had no weight and it has been left to private initiative to stimulate public opinion and develop systems of roads. First came the bicyclists, who started the ball rolling, then came the autoist, who added much impetus to the good roads movement. Today the good road movement has gained the support of the farmer and the large commercial interests with the advent of the motor truck, are now clamoring for roads that will carry loads economically at all seasons of the year.

In all the United States, the percentage improved of the total of 2,500,000 miles of road is woefully small and very unequally distributed. The little State of Rhode Island leads all the rest with more than 50 per cent. of its 2120.75 miles of public roads improved. Of this mileage 294 or 13.86 per cent. is built and maintained by the state. Massachusetts has but 920 miles out of 17,222 or only 5.34 per cent.



Since its creation on Feb. 1, 1902, the Rhode Island board has sought some improvement over the ordinary water bound macadam. The rising tide of automobile travel was beginning to be felt and macadam roads were beginning to feel its effects. In 1906 the first of a series of experiments was begun at Charlestown, R. I. A section of road was built with a bituminous top using a mixture of tar and stone, hand mixed on board platforms. The road still stands as an example of good road work adapted to the requirements of a through automobile route.

An experimental period ensued during which a wide variety of bituminous materials was tried under widely varying conditions of soil, moisture, traffic and climate. Although the State of Rhode Island is small it has both seashore and upland and has every variety of traffic from the dense heavy teaming near Providence to the sparse traffic of the Connecticut border line. By 1909 the board was so well satisfied with the bituminous binder that it contracted for 21 miles. This type of road eliminated dust, got rid of the mud and so far improved the sanitation as to make the bituminous roadways much more desirable for residence. Users of the roadways were able to haul greater loads and the roads were good the year through.

Lonsdale Avenue at Whipple's Bridge, West Lonsdale, Lincoln, R. I., Another Section of the Tarvia Work of 1912.

In 1911 no appropriation was available, but in 1912 the bituminous work was resumed. By this time the tar experiments had proved so far successful that the board determined to use refined tar as a binder. The board said (annual report 1911):

Without entering the many details of applying some 10 different ingredients in their various combinations employed in our experimental tests—these having been given in former reports—suffice it to say that we have been forced to the conclusion that the straight tar in a crude or a refined state is the most effective and economical binder to be used in building a macadam road surface and best suited to the climatic conditions and requirements of travel in our own state.

The work authorized under the 1912 contracts consisted of 19 sections varying in length from .5 mile to 18 miles. Of this mileage 35 was completed. In addition the board undertook to resurface a considerable area of plain macadam with a two-inch bituminous top. Almost 23 miles of this resurfacing was done, bringing the total of tar construction in the state up to 84 miles. The board issued the following specifications covering the work:

Bituminous Surface.

The stone for this course shall be one-quarter inch to one and one-half inch in size and shall be dry and free from dust and dirt. The bituminous material will consist of refined coal tar furnished by the state board of public roads at the railroad freight station nearest the site of the work, in tank cars of approximately 8000 to 10,000 gallons capacity, fitted with steam coils. * * *

The tar shall be heated in kettles to a temperature of 200 degrees Fahrenheit, and mixed with the stone either by hand on dumping boards or by machine satisfactory to the engineer. Approximately 15 gallons of tar shall be used with each cubic yard of stone, and the whole mass shall be turned until the stones are thoroughly coated. The mixing shall be done at such place or places as may be agreed upon between the engineer and the contractor.

After being thoroughly coated with the tar the stone shall be placed upon the foundation or lower course prepared as hereinbefore described and thoroughly rolled satisfactorily to the engineer or inspector, with a roller whose weight shall not exceed 10 tons.

Seal Coat.

After the course has been prepared as above described, a flush coat of about one-half gallon of tar or asphalt (to be furnished by the board) to the square yard shall be applied to the surface, and clean, sharp and dry sand, free from loam, clay and foreign matter of all kinds spread upon it to a depth of one-half inch. The whole surface shall then be rolled as directed by the engineer or inspector.

At places where the bituminous material appears excessively on the surface more sand shall be added.

Without Seal Coat.

Upon the bituminous course, thoroughly rolled, shall be spread a layer of clean, sharp and dry sand, free from loam, clay and foreign matter of all kinds, to a depth of one-half inch. The road shall then again be rolled as directed by the engineer or inspector.

At places where the bituminous material appears excessively on the surface, more sand shall be added.

Elmwood Avenue, Warwick, R. I., One of the Most Travelled Main Roads of the State, Constructed of Tarvia in 1912.

Digitized by Google

Stretch of State Road at Tiverton, R. I., a Much Travelled Route to Newport, Constructed with Tarvia in 1912.

No bituminous material shall be laid later than the date designated by the engineer.

The price per square yard for bituminous work as specified above will be over and above the cost of an ordinary water-bound macadam road.

A finished road six inches in depth, four inches of this in the foundation and two inches of tar macadam, has been the usual construction. On excessively heavy travelled town streets the thickness of the tar mixed course is increased.

The previous experiments by the state board convinced the members that owing to the great variations found in crude tar, it was much better to use a refined coal tar product, and Tarvia A was called for in the specification. In the actual carrying out of the work the base course was well rolled and then spattered with .25 gallon of Tarvia a square yard. This coat was in some cases omitted. Upon the base thus prepared a two-inch layer of stone coated with Tarvia A was used. The stone was coated either in mechanical mixers or by hand on mixing boards.

The experience of the state quickly proved that the mechanical mixer was far more economical and speedy, and during the last of the season practically all work was done by the mixing machine. After the two inches were spread it was thoroughly rolled in order to consolidate it and to force it into close union with the base. On the work done by contract the surface was then covered with pea stone and opened to traffic. It was the intention of the board to delay the seal coat on this surface until 1913. On the work done by the state itself the seal coat was in most instances applied at once. About a half gallon of Tarvia A was used.

The mixers adopted were of several different types, but a cube mixer furnished with an oil torch for heating the stone was most universally used. Eighteen mixers altogether were on the work at the last of the season. The mixers proved very satisfactory when carefully handled, but new men showed a tendency to overheat the stone and Tarvia, causing a burning of the batch. This is noticed at one or two places in the work of last year and causes a break in the road of the width of a single batch. On the whole, this trouble was negligible and the work done by these machines was excellent. Some of the mixers were

Tower Hill Road, South Kingstown, R. I., a Part of the Most Direct Route Between Providence and New York, Built with Tarvia in 1912.

Narragansett Pier Road, North of Wickford, R. I., Very Heavily Travelled, a Part of the 1912 Tarvia Mixed Work.

stationed at the crushers and the plants so arranged that the crusher delivered stone directly to the mixer. This proved very economical where the stone was crushed at or near the job. When the stone was brought in on the railroad, it was found more economical to use a portable plant and move it along the road as the work progressed.

It is interesting in this connection to compare the cost of work by the machine and by hand methods.

The following figures, based on careful observation of the various jobs, are a close approximation of the relative costs by the two methods:

No. 1—Portable plant on resurfacing—two inches thick, 440 square yards.

	A day
Foreman, one-half time	$2.50
Engineer	2.50
Six laborers at $1.85	11.10
Kettle man	2.25
Two men spreading at $1.85	3.70
Total	$22.05

This gives a cost of $0.05 a square yard for labor of mixing and spreading stone and Tarvia. The mixer turned seven to eight batches an hour, which covered 50 square yards of surface. Observation of two other portable plants gave approximately the same labor cost.

No. 2—Hand mixing on board platform: Resurfacing two inches thick, 280 square yards.

	A day
Foreman, one-half time	$2.50
Ten laborers at $1.85	18.50
One kettle man	2.25
Total	$23.25

This gives $0.085 a square yard as the cost for labor of mixing and spreading.

A comparison of these costs shows the advantage of the mixer. It must be remembered, however, that these are labor charges only and that the cost of the work using the mixer is increased by the interest and depreciation for the machinery and the cost of installing and moving the plant.

The winter of 1912-1913 has been a particularly hard one on the roads of the state. There was practically no snow to protect the roads and in addition there was an unusually large fall of rain with a temperature alternating between thawing and freezing.

An inspection trip of the state roads during the last week in April demonstrated that in spite of the unusually severe winter the new highways built during 1912 have stood under trying condi-

Mosaic Surface, Built with Tarvia A in Elmwood Avenue, Warwick, R. I., a Surface Equally Good for Automobiles and Horses.

tions extremely well. After a period that ought to develop any possibility of failure either in the foundation or in the surface, the roads built with Tarvia are smooth and even, and with complete absence of ravelling even in the shoulders. The only signs of failure in any place are where the absence of a seal coat failed to protect a surface left somewhat weak by the burning of batches of Tarvia as has been explained in the operating of the mixing machine. These areas, however, in the total 57.25 miles of bituminous macadam laid last year, are so extremely small as to be negligible. Only an extremely small outlay would be needed to put the whole area in a condition that would please even the most critical user of a good road.

An examination of the other roads built in preceding years by the state board of plain macadam and with bituminous materials of other kinds, shows the wisdom of the slight expenditure a mile called for in the bituminous macadam.

The old macadam roads have been badly affected by the hard winter conditions and are in many cases so rough and out of shape that riding over them is a distinctly unpleasant experience. Many sections of the experimental roads built with a variety of bitumens have shown signs of stress during the prevailing hard winter conditions, and should be repaired at once in order to put them in good condition and save future expense.

The Rhode Island people will have the opportunity of voting at a special election on a propositon for the state to issue bonds to the value of $700,000 for highway construction, and the legislature has made appropriations in addition which, with the fund from motor vehicle licenses will probably place in the hands of the board of public roads about $500,000 more. During the past session of the General Assembly 20 resolutions were passed extending the mileage under the jurisdiction of the state board, and even these appropriations will hardly be sufficient to complete the work projected. Up to the present time the state has expended $2,853,933.79 in the betterment of roads. This is represented by 61 miles of bituminous macadam, 23 miles of rebuilt macadam, 37.65 miles of bituminous macadam contracted for but not completed and 210 miles of macadam road. The work for 1913 will be begun this month.

Tarvia

Preserves Roads
Prevents Dust~

Dudley Avenue, Westfield, N. J.

A Tarvia Town

THERE are many towns in this country which began with Tarvia years ago and finding it successful have extended its use on their roadways year by year as a matter of fixed policy. Such a town is Westfield, N. J., which now has 19 miles of tarviated streets.

Mr. A. W. Vars, the town engineer, reports that the "Tarvia B" treatment on all these streets averaged 1 ¾ c. per square yard for the season of 1912; compared with the cost of keeping down the dust and maintaining the road surface by any other method, this is a very low figure.

The roads have been free from dust and have not been seriously impaired by automobile traffic.

Tarvia acts as a binder and cements the road surface firmly together in a plastic matrix. Automobiles do not hurt such a surface but roll it down smoother.

The amount of new stone screenings needed for surface maintenance is greatly reduced by the Tarvia treatment and the road keeps in better condition. The longer the Tarvia treatment is maintained, the less the annual cost.

RETURNS TO FISK CONCERN.

E. H. Broadwell Becomes Vice President upon Retiring from Hudson Motor Car Company.

E. H. Broadwell, who recently resigned as vice president of the Hudson Motor Car Company, Detroit, maker of Hudson cars, has assumed the vice presidency of the Fisk Rubber Company, Chicopee Falls, Mass., maker of Fisk tires, with whom he was for many years associated before going to the Hudson company. Mr. Broadwell's headquarters will be at the main office of the Fisk company at Chicopee Falls, and he will devote his personal attention to the direction of the sales department.

Mr. Broadwell has made a successful career for himself in the automobile industry and his knowledge of tire manufacture was gained by years of connection therewith, during which he made the business a serious study. His work at Detroit for the Hudson company gained him recognition as a progressive, indefatigable worker and no details of his department were neglected. His acquisition by the Fisk staff, while in the nature of a return to his former scene of activity, is a decided source of gratification to that company, the organization of which is decidedly strengthened thereby.

E. H. Broadwell, Vice President Fisk Rubber Company.

EMPLOYEES SHARE PROFITS.

Studebaker Corporation Adopts Plan Which Permits Them to Become Shareholders.

Operating large plants at Detroit, Mich., and South Bend, Ind., the Studebaker Corporation, maker of Studebaker pleasure cars and trucks, has put into effect a plan whereby certain of its employees may become stockholders and share in the profits of the concern. The plan, which was adopted at a meeting of the board of directors, is ample. It provides, after dividends shall have been earned on the common and preferred stock, that a fund shall be set apart for the purchase, at market prices, of common stock of the corporation to be held in trust for three-year periods and then distributed with its earnings among participating employees.

Details of the plan explain rules affecting employees who might die, retire on account of age or leave the service of the corporation. An equitable system has been devised whereby the rights of all are conserved. The fund is to be set apart from the assets of the corporation and is to be administered by a board composed of the first vice president, the general manager, treasurer and assistant general manager at Detroit, the manager of the works at South Bend and an official selected from the officers of the trust company that may be selected as custodian of the fund.

McCUE RESIGNS PRESIDENCY.

Understood That Manufacture of McCue Wire Wheels Will Be Under New Policy.

C. T. McCue, former president and founder of the McCue Company, Buffalo, N. Y., has resigned his office and severed all connection with the company's affairs. His action was the outcome, it is said, of differences following the reorganization of the concern. W. T. Evans has been chosen general manager and it is expected that he will succeed to the presidency.

Mr. Evans was formerly manager of the Metal Products Company, Detroit, and for nine years was with the Westinghouse Machine Company. He will reopen the McCue drop forge plant, under the direction of George Desautels, and it is understood that separate concerns will be formed, probably in Indiana, Michigan and Ohio, for the production of McCue wire wheels, etc.

Herbert Cole, well known in motoring circles in Boston and vicinity, has taken the New England agency for G. J. G. and Ohio cars, and has established a temporary sales office in the Garden building, Boylston and Church streets, and a temporary service station in the Motor Mart on Pleasant street. This is the first appearance of the G. J. G. in this territory, and while the Ohio is not a new comer, it makes its re-entry after several seasons of absence.

Digitized by Google

FLOODS AFFECT SCHACHT.

Disaster Came at a Particularly Unfortunate Time for Cincinnati Concern.

It appears that the recent floods in Ohio had a depressing effect upon the Schacht Motor Car Company, Cincinnati, O., maker of Schacht cars. From a statement made by John H. Miller, vice president of the concern, it seems that the disaster came at a particularly unfortunate time. John F. Dietz has been appointed temporary receiver, and according to Mr. Miller the assets have a book value of approximately $600,000, while the liabilities of every description will not exceed $175,000.

The Schacht company has been engaged in business for a number of years. About two years ago it moved into a new plant and shortly after that decided to make certain changes in its cars. For some time it had considerable difficulty with its construction work, and later differences arose as to the conduct of the business. While negotiations were under way in an effort to settle these matters the floods made it impossible to get shipments of material and to move completed products. A number of those indebted to the company also were affected. As a result of these conditions some means were deemed necessary to bridge over the situation.

Mr. Miller's statement sets forth that practically all of the stockholders and approximately 85 per cent. of the creditors joined in the selection of Mr. Dietz, and he holds that with proper cooperation it should be entirely possible under existing circumstances to pay off all creditors in full and leave quite a comfortable margin for the stockholders. It is the object of the receiver to continue the business, and the order of the court is to that effect.

SPRING WHEEL CONCERN.

Invention of Chicago Man to Be Produced by New Company in South Bend, Ind.

A corporation composed of capitalists of South Bend, Ind., to be known as the South Bend Spring Wheel Company, is in process of formation to manufacture a new automobile wheel, in which the spokes are displaced by springs. The rights to the invention, which is by E. A. Nelson of Chicago, have been secured by the South Bend men.

The new concern will be capitalized at several hundred thousand dollars and a factory will be erected for the exclusive manufacture of the wheels. Fred G. and Otto Collmer of Collmer Bros., bicycle manufacturer and tool specialist, are promoters of the company and for the present the new wheels will be made in the Collmer factory at 420 South St. Joseph street.

IS LOCATED IN DETROIT.

Firestone Man in Syracuse Is Selected to Look After Tire Interests There.

Charles M. White, Jr., who has been representing the Firestone Tire & Rubber Company, Akron, O., maker of Firestone tires, in Syracuse, N. Y., has located in Detroit as pneumatic tire representative to the automobile manufacturers of Michigan. While in Syracuse Mr. White was particularly active in the interests of the company, and it was due largely to his efforts that it was deemed wise to open a new branch and service station there, which will be located at 502-504 East Genessee street. His removal to the heart of the motor car industry is looked upon in the nature of a well deserved promotion.

Charles M. White, Jr., with Firestone Tire & Rubber Company.

E. A. Hoffman, formerly manager of Wyckoff, Church & Partridge's supply house in New York City, has been appointed manager of the new Firestone branch in Syracuse. Mr. Hoffman has lived most of his life in Syracuse, where he has a host of friends, and his selection to take up the work now laid down by Mr. White is considered particularly fortunate. His experience dates back to the bicycle days, and at one time he was in business for himself in that city, operating as Hoffman & Weaver. It is expected that he will prove a very strong addition to the Firestone sales force, as well as of incalculable assistance to pleasure car and motor truck owners and users.

RICHMAN LEAVES HUDSON.

Becomes Factory Production Manager for the Cole Motor Car Company.

Following the announcement of George H. Strout's resignation from the Cole Motor Car Company, Indianapolis, Ind., to become general sales manager for the Haynes Automobile Company, Kokomo, Ind., comes the information that J. F. Richman, for the past four years factory superintendent for the Hudson Motor Car Company, Detroit, has been appointed factory production manager of the Cole organization. This is a new position, created recently by President J. J. Cole because of the increase in the company's business.

J. F. Richman, Production Manager, Cole Motor Car Company.

Mr. Richman goes to his new duties with the good wishes of a host of friends in Detroit and throughout the industry. Before becoming associated with the Hudson company he was for a long time with the Maxwell-Briscoe Motor Company's plant in Newcastle, Ind., and he also served for a time with the Olds Motor Works, Lansing, Mich., and with a number of machine factories. He is particularly well fitted for the position and his selection is in keeping with Mr. Cole's announced intention of securing men of the highest ability to head the various departments of his organization.

TO PRODUCE MOTOR HEARSES.

Understood That Grand Rapids Concern Will Engage in New Line of Activity.

According to information from Grand Rapids, Mich., the Michigan Hearse & Carriage Company of that city will enter the automobile field, producing motor hearses, principally, and motor trucks. It has long been engaged in the manufacture of funeral cars, undertaker's wagons, ambulances, etc.

While the rumor cannot be verified, it is understood that additional capital has been secured and that men closely identified with the Grand Rapids Motor Truck Company will be on the new board of directors. The first named concern is not yet ready to make an announcement, and it is not definitely known whether the new business will be conducted under the old name.

TESTING KEROSENE CARBURETOR.

Ray Harroun Secures Important Results from His New Invention.

Announcement was made some little time ago of a new carburetor designed by Ray Harroun, the well known racing driver. The device is being manufactured by the Ray Harroun Company, Indianapolis, Ind., and this company reports the results of recent tests which seem to indicate that the vaporizer operates successfully on kerosene, motor spirit or gasoline.

The first test was over the road from Chicago to Indianapolis, by way of Logansport and Kokomo, a distance of 224.2 miles, under what was regarded as average touring conditions. This was made entirely on kerosene, and the fuel consumption worked out at 17.25 miles to the gallon.

Harroun next covered 500 miles on the Indianapolis speedway, utilizing four different kinds of fuel, alternately. The results as reported by the observers were as follows:

Fuel	Gravity Baume	Price cents	Miles a gal.	Cost a mile
Kerosene	43	.08	22.2	$0.0036
Kerosene	49	.10	21.6	.0046

GEDDES SUCCEEDS KELLY.

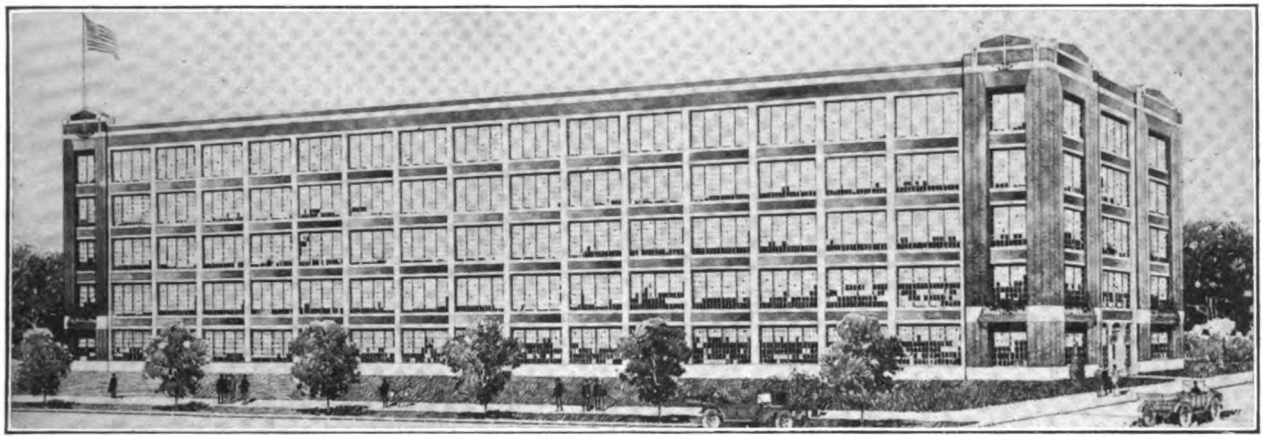
President of Kelly-Springfield Motor Truck Company Retires on Acount of Ill Health.

The many friends of E. S. Kelly, president of the Kelly-Springfield Motor Truck Company, Springfield, O., maker of Kelly trucks, will regret to learn that his health is such that he has felt compelled to retire from the active detailed management of the company. Mr. Kelly becomes chairman of the board of directors and will continue to exercise a general oversight over the

Digitized by Google

affairs of the concern, but the details of the management will devolve upon James L. Geddes, who succeeds Mr. Kelly as president. He will be assisted by O. S. Kelly, who continues to be general manager.

The affairs of the company are in most excellent shape. The factory is running to its fullest capacity and the demand for the goods is sufficient to give every assurance of a prosperous future for the company. Mr. Kelly, while regretting his inability to continue as president, feels that he has secured a very competent successor in Mr. Geddes, who for many years was associated with Emerson McMillan, chairman of the board of the American Light & Traction Company, and who, with the firm of Emerson McMillan & Co., banker, holds a controlling interest in the truck company. Mr. Geddes has been connected with the Detroit City Gas Company for 14 years, joining its force in 1899, after a number of years with the Grand Trunk railroad in Port Huron, Mich., Detroit and Montreal, Can. His past business career has been such that the fullest confidence is felt as to his conduct of the truck concern.



Mr. Kelly was one of the pioneers in the rubber tire business. In 1894 he started the Kelly-Springfield Tire Company, which produced rubber tires for horse drawn vehicles. After promoting that company to a high production and financial efficiency he retired from its board of directors, disposing of his stock. He remained inactive until about three years ago when he purchased and reorganized the Frayer-Miller Motor Truck Company and began a campaign of development. He is now at Dansville, N. Y., where he hopes to recuperate sufficiently to enable him to pass some time in Europe the coming summer.

ERECTING NEW FACTORY.

Gray & Davis Expects to Move into Cambridge Plant in Near Future.

Gray & Davis, Boston, Mass., has prepared plans and is having erected in Cambridge a handsome modern factory building, five stories high, 381 feet six inches long by 81 feet wide on the first floor and 61 feet wide above that. The design has been prepared with a view to permitting additions in the future.

An accompanying illustration presents a general view of the structure. The exterior will have a veneer of tapestry brick and will be so treated that nearly 70 per cent. of the wall area will be of glass, using steel sash. There will be a large show room on the first floor, while the offices will be located on the second, occupying the full width of the building for a length of 200 feet. The directors' room and the private office of Mr. Gray will be lined with a special design of tapestry brick, contain large fireplaces and be fitted with every modern convenience.

New Factory Building Now Being Erected in Cambridge, Mass., by Gray & Davis, Boston.

In the factory proper the ceiling will be painted a light color to assist in the light distribution. There will be locker rooms on every floor, containing steel lockers, one for each employee. Electrical time clocks will be placed on every floor, and these will register with a master clock in the main office. Electrical power will be used entirely, and in short the fittings will be modern in every particular.

The Illinois senate has passed a bill providing for imprisonment from two to 10 years for the theft of an automobile. This action is similar to that taken by other states.

NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS.

Goodman Tire Shield.

The Goodman tire shield, marketed by the Approved Auto Specialties Company, 1737 Broadway, New York City, as the name implies, protects the casing and inner tube, and when utilized with an old shoe prevents punctures and blow-outs as well as adds to its service. The shield is constructed of several layers of tough, four-ply fabric chemically and asbestos treated, making it a non-conductor of heat as well as rust and friction proof. It is quilted and shaped to form a complete inner tube which fits snugly, but is capable of suitable expansion. It is free from buckles, seams, ridges, etc., and is easily fitted. It increases the efficiency of the tube in that contact of the latter with metal is prevented. It may also be employed to reinforce a casing weakened by a cut.

Justice Wheel Puller.

P. S. Justice & Co., 421 Chestnut street, Philadelphia, is manufacturing the Justice wheel puller, which is stated to have a capacity of seven tons. It is provided with a small round base attached to the screw member and the former may be displaced if desired by removing a set screw. Insead of arms or yokes a chain is employed and this is adjustable. It is operated in the usual manner, the chain being fitted around the hub of the wheel and the screw end applied to the axle, etc. The travel of the screw member is four inches, width of yoke 16.5, diameter of base four and weight of device 24 pounds. The chain is 11 feet long.

Dean Fordorn.

The Dean Auto Devices, 120 Sangamon street, Chicago, is manufacturing an electric horn for model T Ford cars that differs from the conventional signal in that it is operated by the current generated by the flywheel magneto and does not interfere with the ignition. The note is clear and penetrating and the pitch follows the speed of the motor, the blows on the diaphragm being said to be from 25 to 600 a second. The horn weighs but 26 ounces, is moderately priced and is held to require no attention or adjustment after installation.

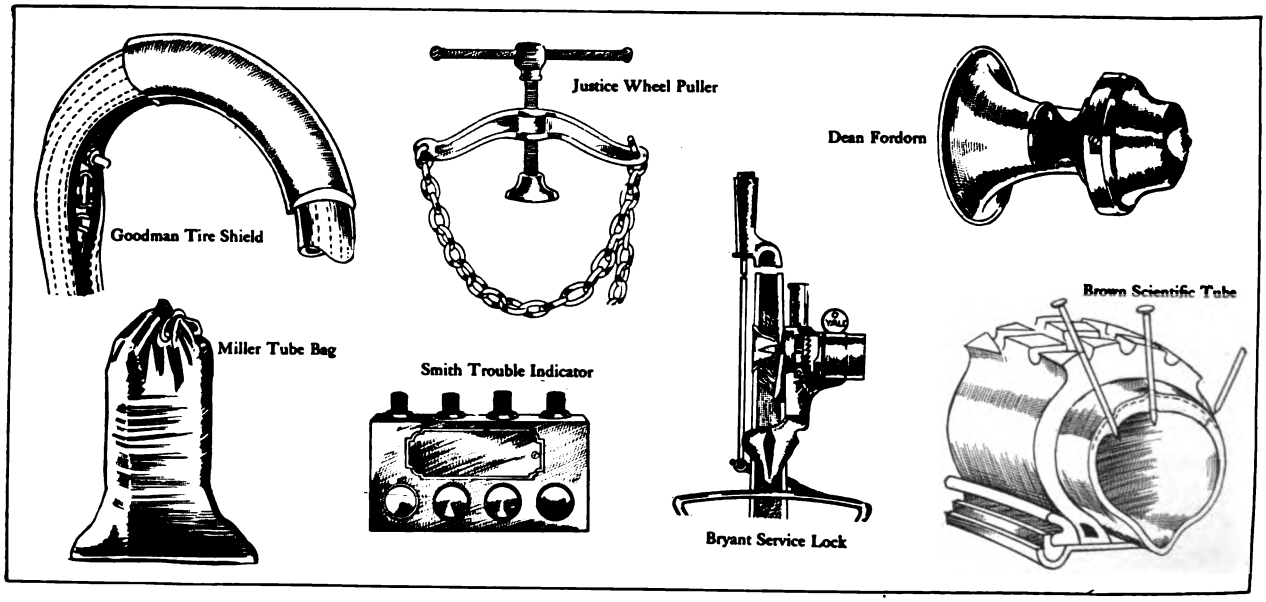
Miller Tube Bag.

Inner tubes should not be carried among the tools of the car or exposed to the action of oils, grease, moisture or light. The proper method is to utilize a tube bag, one that will exclude foreign elements as well as prevent injury to the rubber. Chas. E. Miller, 97-103 Reade street, New York City, is marketing a tube bag which although inexpensive embodies the essential qualities of high priced members. It is made of a heavy napped cloth and its design is similar to conventional types.

Smith Trouble Indicator.

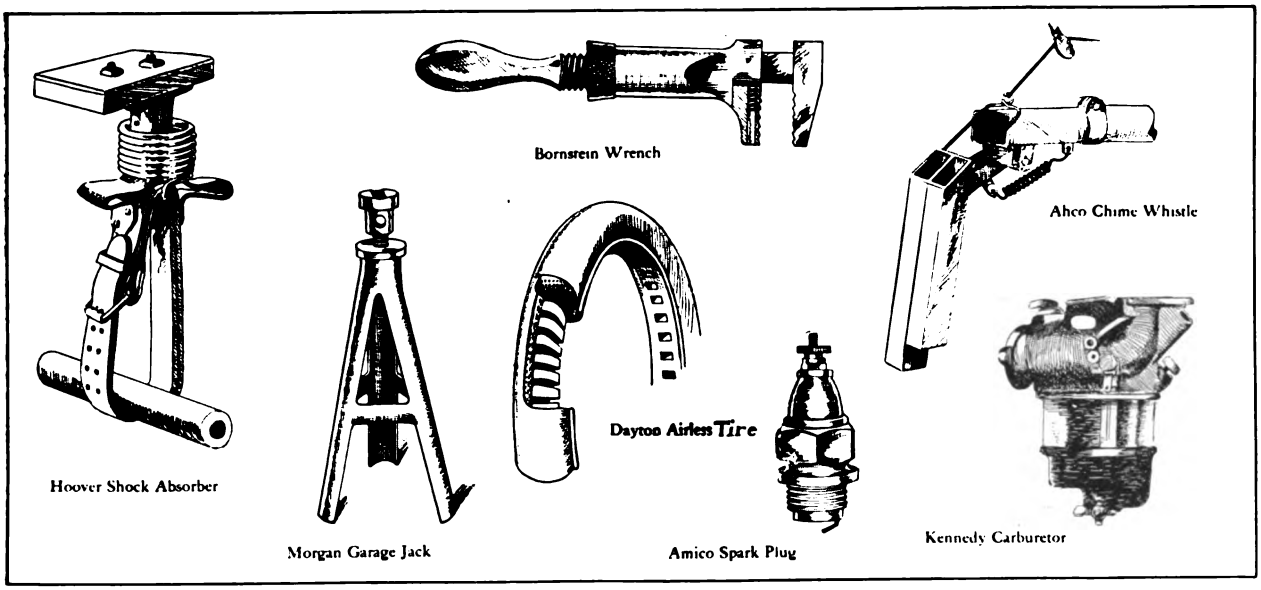
Smith & Gunn, Burlington, N. J., is marketing the Smith trouble indicator, a device for locating a missing cylinder, etc., by electricity, a light being flashed when the instrument is utilized. It is fitted to the dash and when employed in connection with a four-cylinder motor consists of four buttons and a like number of lenses. It is operated by pressing a button which cuts out the other cylinders, enabling the driver to test each in turn.

Bryant Service Lock.



The Bryant service lock is manufactured by the E. H. Bryant Company, Cleveland, O., and locking as it does the gear shift lever, use of the car is prevented. The device is secured to the lever and depressing a knob operates a fork which causes wedges to fill the space on both sides of the gate. It is equipped with a Yale lock and turning the key automatically lifts the fork member out of engagement. The Bryant lock is positive in its action, very compact and neat, and is finished in brass, nickel or black.

Brown Scientific Inner Tube.



The Brown scientific inner tube presents interesting features in that it will not deflate when punctured and that this desirable quality is not secured through fillers of any kind, nothing but air being utilized as with a regulation tube. The self-closing of the puncture is due to the construction. The tube is made with a heavy tread, about twice as thick as usual, and as it is manufactured it is turned inside out. This places the excess material in compression, and it is held firmly in place by a strip of canvas or fabric on the outside. When the tube is punctured the tread portion of the rubber, due to the compression under which it is placed, immediately squeezes together, preventing the escape of the air. The thickened tread adds to the life of the casing, reinforcing the latter. The Brown tube is made of Para rubber. It is marketed by the Brown Scientific Tube Distributors, Broadway and Seventy-second street, New York City. C. J. Cross & Co., 1878 Broadway of the same city, is eastern agent.

Hoover Shock Absorber.

The Hoover shock absorber, made by the W. H. Hoover Company, New Berlin, O., is a combination device in that it serves as a rebound strap in addition to eliminating shocks to the chassis components. It is simple in design, easily fitted and is suited to any type of car. It comprises a steel plate which is secured to the floor of the vehicle, a coil spring of crucible steel, a steel strap attachment, and leather loops and straps of special chrome tanned rawhide. The latter encircle the axle and when the springs of the machine become extended to the danger point the rebound strap comes into action, checking the movement. The coil spring gradual-

Digitized by Google

ly retards the upward movement. The leather straps are adjustable.

Bornstein Wrench.

Henry Bornstein & Co., Ipswich, Mass., is manufacturing the Bornstein patent pipe and vise wrench, which is designed for automobile and other service. It is made in several models, with plain jaws and for handling piping, etc., and a quality claimed of it is that lost motion is eliminated by the construction. The material and workmanship are high grade.

Morgan Garage Jack.

The Morgan Manufacturing Company, Newport, R. I., has brought out a new type of garage jack which differs from the usual tool in that the base is wide, preventing slipping. The three legs are sturdily constructed and the space between them is such as to prevent any possibility of tipping over. The jack head is made with a recess wide enough for the chassis to fit into it and throughout the best of material is employed. The height of the jack is 20.5 inches and it has an extension of nine.

Ahco Chime Whistle.

The Ahco chime whistle is the product of the Arnold-Hough Company, Inc., 124 Washington street, Providence, R. I., and is designed for model T Ford cars, being attached over the exhaust pipe of the muffler and being secured by a locking bolt and nut. It is constructed of aluminum and has a rich, mellow tone that is far reaching in its effect. One of the features of the Ahco is that it does not obstruct the passage of the burnt gases when not in operation. The signal is free from purring noises, the chime member being well below the outlet and being retained by a spring. The whistle is operated in the conventional manner, by a pedal, which actuates a cable, the latter lifting the chime into position. The whistle comes complete with brass pedal, cord and pulley. It is marketed by the Waite Auto Supply Company, Providence, R. I.

Dayton Airless Tire.

Resiliency, freedom from puncture or blow-outs, and absence of vibration are the features emphasized of the Dayton airless tire, made by the Dayton Rubber Manufacturing Company, 1011 Kiser street, Dayton, O. It is not a solid or a filled casing, but possesses the advantages of the former in that it requires no attention after fitting. The construction of the Dayton may be compared to the felloe and spokes of an automobile wheel in that it comprises an annular rib of straight cut fabric and rubber and piers of elastic, high grade rubber. The latter are spaced and the compartments between provide room for their expansion in encountering road obstructions, such as a stone, etc. Instead of the shoe bouncing, the rubber blocks are squeezed down and bulged out, providing resiliency. The shoe is constructed to fit standard rims and outwardly cannot be detected from conventional casings. They are made in both smooth and non-skid treads.

Amico Spark Plug.

The American Ignition Company, Inc., 319 Adams street, Dorchester, Mass., is marketing a new spark plug which presents practical features. The Amico plug differs from those of conventional design in several particulars and the most striking point is the provision made for expansion of the porcelain, which material is utilized for insulating purposes. The porcelain is approximately an inch in diameter, making for extreme strength and durability, and it should withstand severe usage. The metal shell of the plug is sturdily constructed and is provided with the usual hexagon, but the interior has a decided taper. This is for the purpose of compensating for the expansion of the porcelain, and if such action occurs it is on an incline. The packing is asbestos, which is completely wound around the porcelain, and the gasket is .75 inch high, making a perfect joint as well as one that is gas tight. The porcelain is retained at uniform pressure, by a vamped ridge. One of the qualities of the plug is that the electrode on the shell is liberal in size and not easily sprung out of positon through careless handling. The main electrode extends through the centre of the porcelain and the tapered end of the latter provides ample room for the gases to clean the points. The Amico is guaranteed and is moderately priced.

Kennedy Carburetor.

Easy starting in all temperatures, simplicity of adjustment and a fire proof construction are features emphasized with the Kennedy carburetor, manufactured by the L. D. Robbins Company, Lynn, Mass., for which F. Shirley Boyd, 903 Boylston street, is Boston representative. It has two adjustments, a high and low speed needle valve, and but one air inlet. The latter is provided with a full size hot air tube leading to the exhaust pipe of the motor and in the event of a backfire the danger of fire is reduced to a minimum. Easy starting qualities are secured through an accumulation of fuel below the gasoline level, which provides a rich mixture. This puddle forms automatically on stopping the motor. One of the features claimed of the carburetor is the use of a by-pass tube for providing a proper mixture at low speeds. The usual springs, etc., are eliminated, and a uniform mixture is secured at high or low ratios. The Kennedy is held to be very economical of fuel.

Miller Hydrometer Syringe.

The importance of maintaining the proper specific gravity of the electrolyte in the cells of the storage battery cannot be emphasized too strongly. As the modern automobile is equipped with electric lighting which depends upon the storage battery when the car is inoperative or travelling at very slow speeds, it is imperative that the instructions of the maker of the battery be complied with. As more or less of the fluid evaporates it has

Digitized by Google

to be replaced, and sometimes it may be necessary to add acid. To ascertain the specific gravity a hydrometer syringe is utilized and these members are inexpensive. They are also used to check the performance of the dynamo. Chas. E. Miller, 97-103 Reade street, New York City, is marketing the Miller hydrometer syringe, which comes in a polished oak case and has a special filling nozzle. The scale is calibrated for Baume and specific gravity and it is a simple matter to take readings of the electrolyte.

Standard Trunk Racks.

The tendency toward clean running boards and the elimination of accessories formerly fitted to the outside of the car have resulted in the more general use of the trunk rack. These members are decidedly useful in that a large amount of luggage, etc., may be carried at the rear of the car where they are not only out of the way, but very accessible. The Connecticut Steel & Wire Company, Hartford, Conn., specializes in trunk racks and manufactures a wide variety to meet individual requirements and the design of the vehicle. The Standard trunk racks are of the folding type, constructed of high grade material, and although light are sturdy.

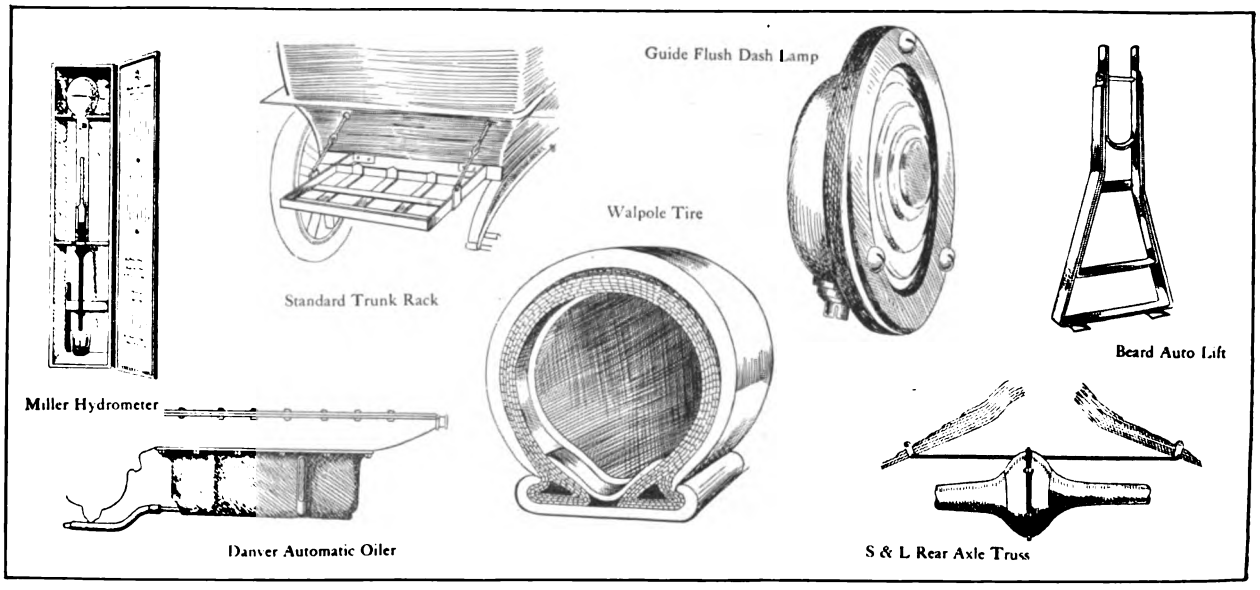
Guide Flush Dash Lamp.

The Guide Motor Lamp Manufacturing Company, Cleveland, O., is marketing a popular priced electric lamp of the flush dash type. The design eliminates the use of brackets as well as annoying rattles, being mounted in the dash, which is cut to take the lamp proper. The latter is provided with a flange for securing it and a back piece covers the mitre where the light goes through. The design is very neat and compact and the semaphore is constructed of heavy glass. The overall diameter of the lamp is 4.5 inches, requiring a 3.5-inch hole for fitting, and the dash thickness varies from .625 to one inch. The lamps are highly finished with front in brass and back in black or with nickel or black front.

Beard Auto Lift.

Tires are injured by allowing them to carry the weight of the machine when the latter is out of service for any length of time. The Walter H. Van Deusen Sales Company, Detroit, is marketing the Beard auto lift, which comes in sets of four. It is a simple device, which is placed under the hub of the wheel, raising it free from the ground by a slight pressure of the foot or hand. The mechanical principle involved is said to be such that it can be operated easily and without effort by a child. The design is free from springs, etc., and there is no possible danger of the lever springing back. The lifts are constructed of high grade steel, held to be indestructible, and the set weighs but 27 pounds. An additional feature is that they may be folded up and carried in the tool box.

Danver Ford Automatic Oiler.



The A. .C. Danver Company, Borden and Hospital streets, Providence, R. I., has brought out an automatic auxiliary oiling system for model T Ford motors which presents several interesting as well as practical features. The most noticeable quality of the device is that means are provided for constantly maintaining the height of the lubricant in the crankcase, thus preventing excessive smoking as well as carbon. This is accomplished by a standpipe which governs the height of the oil irrespective of the amount poured into the sump. The system is of the constant circulating type, the oil flowing from the crankcase through the standpipe to the sump, thence to the reservoir in the flywheel housing and back to the motor. By this arrangement the lubricant is kept cool and the parts are supplied with a more efficient oil. A protected glass gauge is fitted to the side of the oiler where its location is readily accessible and it may be seen without stooping under the car. The glass is removable for cleaning when desired and the retaining members are leak proof. The oiler is easily fitted, replacing the lower crankcase cover, and the holes are accurately drilled. The pipe connecting the sump with the flywheel housing is secured to the latter by a special construction, quickly attached. The maker points out that greater lubricating capacity is provided, the sump holding double the usual amount of oil, and that an oversupply will not cause smoking. The supply is replenished through the breather pipe in the usual manner. The Danver oiler is constructed in aluminum and iron, nicely finished, and is not noticeable when fitted to the motor.

Walpole Tire.

One of the several features of the Walpole tire, made by the Walpole Tire & Rubber Company, with sales offices at 757 Boylston street, Boston, is that its construction is such that it is guaranteed against stone bruises, one of the most common causes of tire troubles. The casing is cured as a unit and throughout the best of material and workmanship are incorporated. They are manufactured in two types, a clincher designed to fit the one-piece rim and the quick detachable. The latter is identical with the regular clincher except for the bead, which is made stiffer and non-expanding. It also has a flap to protect the inner tube. As will be noted by the illustration an extra heavy layer of rubber protects the side walls of the casing and the tread is liberal in size. The Walpole tire is constructed for motorists desiring a high grade casing and it carries a mileage guarantee of 4000 miles.

S. & L. Rear Axle Truss.

Sunvold & Larson, Sacred Heart, Minn., is manufacturing the S. & L. rear axle truss or support for model T Ford automobiles. It is designed to eliminate opportunity for rear axle breakage, gear stripping or misalignment, and it is held that vibration is reduced to a minimum. It is clamped to the axle and the work is accomplished easily and quickly, requiring no drilling or fitting. The device is inexpensive.

ALCOHOL AS A DECARBONIZER.

Experiments Conducted with Denatured Fluid Indicate Valuable Cleansing Properties.

In a paper read recently before the members of the Metropolitan Section of the Society of Automobile Engineers, New York City, Joseph A. Anglada, M. E., discussed the advantages of denatured alcohol as a solvent of carbon deposits in internal combustion motors. His findings were based on a number of experiments, the motors of 14 different cars and in varying conditions of carbonization being treated with alcohol.

Although various methods of inserting the alcohol were tried, the principle consisted of filling the combustion space with the fluid and allowing it to remain for periods varying from six to 12 hours, after which it was removed by means of an oil gun. It was found in the majority of cases that the carbon was loosened to such an extent that it passed out readily with the exhaust gases during the natural operation of the motor. In some tests a second or third use of alcohol was necessary, depending on the amount and nature of deposits. Between the treatments the car was utilized as usual.

It was found that where the rings fitted poorly the alcohol would leak past into the crankcase, necessitating the cleaning and renewal of the lubricant. The quickest results were obtained when the motor was hot, although heat is not necessary. It was stated by Mr. Anglada that alcohol does not injuriously affect the surfaces of metal with which it is brought into contact.

MARKET OF THE FUTURE.

Cartercar Official Foresees Ever Increasing Demand for Product of the Industry.

America is able to afford more automobiles today than ever before, according to Harry R. Radford, vice president and general manager of the Cartercar Company, Pontiac, Mich., maker of the Cartercar line. He says that the ever increasing prosperity of the country will take care of all the really good cars that can be manufactured at a reasonable cost. He adds:

If this country were the same financially and industrially today that it was some 10 or 15 years ago, there might be some excuse for the assumption that the market might be slackening a bit. But everywhere there is a great boom, and people are buying motor cars today who would not have thought of such a thing only a few years ago.

And another great thing is the improvement in roads and streets that is going on in all parts of the country. Of course these improvements help in the selling of cars, but they must and will be used almost universally whether there are any roads or not. Almost every day we get letters from Cartercar owners telling of the successful use of their machines even on roads which seemingly are impassable for a horse drawn vehicle.

When the first motor car was made the people were not ready for it and they had to learn what it would do and to get used to it. Today they recognize it as one of the important essentials of industry and pleasant living. Automobiles will be sold as long as people continue to live and make money.

YOUNGEST AUTOMOBILE DEALER.

William Whipple, Agent for Michigan in Genoa, Ill., Claims Honor.

Who is the youngest automobile dealer in the United States; that is, the youngest real agent who has a regular contract, sells cars and banks his commissions? William Whipple, Genoa, Ill., lays claim to this honor, and certainly, his claim is worthy of consideration.

William Whipple, Genoa, Ill., Youngest Automobile Agent.

Young Whipple recently passed his 16th birthday, and although his father is the possessor of five prosperous Illinois farms, he has a decided preference for a bank account built up strictly by his own energy. He is the duly accredited agent for Michigan cars, made by the Michigan Motor Car Company, Kalamazoo, Mich., in Genoa.

The young man has a youthful enthusiasm, which seems to win where the older salesman might fail. It may be added that his enthusiasm is backed by accurate knowledge acquired by actual experience in the Michigan factory at Kalamazoo, having spent considerable time in overalls and jumper as a helper to make himself thoroughly familiar with automobile construction. Business does not interfere with studies, as he is in the third year of the high school in Sycamore, Ill.

OBTAINING EFFICIENCY FROM TIRES.

Why Many Motorists Fail to Secure Maximum Mileage---Effect of Impoper Inflation Upon the Fabric---Suggestions Making for Economy---Notes for Owners.

A PROMINENT tire manufacturer is the authority for the statement that 75 per cent. of the casings prematurely scrapped and sold for old rubber, come to an untimely end because they were not cared for properly. This would indicate that a certain class of motorists wastes thousands of dollars annually through carelessness or negligence, despite the educational campaign conducted by tire makers and motoring prints.

Improper inflation is responsible for more tire trouble than anything else and many motorists do not realize this, although repeatedly advised to maintain the air pressure at so many pounds. Many owners are careful in fitting new

When Weighing the Car It Should Be Fully Loaded, Tanks Filled, Etc.: A, Showing How Front Axle Load Is Determined; B, Position of Machine When Ascertaining Rear Axle Load.

shoes to inflate them properly, but thereafter neglect to occasionally test the pressure. A leaky valve or a minute puncture may reduce the pressure below the predetermined amount, and the running of the car under these conditions paves the way for the inevitable blow-out.

It is sometimes difficult for the tire expert to convince an owner that a blow-out is due to improper inflation, especially when the exterior of the casing is in perfect condition. Many automobilists judge a shoe from its outside appearance and do not give its interior any consideration whatsoever. This is an error as the fabric is the real shoe, the rubber serving to retain its shape and to protect the plies from moisture, and contact with the road, and to provide traction.

The alternate layers of fabric are "frictioned" with high grade rubber, which is forced into the voids of the cloth so as to hold it firmly. Over this is placed the breaker strip, another ply of fabric, and the tread is molded to this construction. The resiliency of the shoe is secured through the elasticity of the air, not through compression of the rubber. As a tire is required to endure and carry a large load, and in the case of the rear wheels is also forced to become a driving member, it will be seen that there is a combination of strain that is resisted by the strength of the thread of the fabric and the degree of adherence of the rubber to the thread.

The tread of a shoe is only slightly effected by the weight carried upon it, but the walls are effected in proportion to the load and as the tread may be flattened slightly the walls are curved, sometimes acutely, and every movement of the shoe from road shock is most acute at a point between the line forming the upper half of a transverse section of a tire and its bead. The tire wall is most flexible from the bead to a point midway of the wall and the action or movement of the fabric is termed alternate tensing and releasing of the threads. Some idea of the number of compressions and reactions may be gained by the statement that a 28-inch tire in covering 5000 miles will be subject to about 3,600,000 of these movements.

It follows, therefore, if a shoe be utilized under-inflated, these stresses are exaggerated and the separation of the plies and the breaking of the threads follow. The plies of fabric may be compared to a number of thin strips of cloth cemented together. As a whole the construction will present more resistance than would the same number loosely arranged. With a casing not properly inflated the threads of the fabric are subjected to more frictional stresses, and breakage follows.

There should be no deviation from the rule of keeping the tires inflated at all times to the pressure recommended by the maker. This applies alike in cold or warm weather. The writer has been asked repeatedly if it is not good policy to allow for hot weather in pumping a tire. Some

Digitized by Google

have stated that tire experts advise less pressure, claiming that the air expands when heated. This contention is not borne out by the manufacturer,

SHOWING SPECIAL OR ODD SIZED TIRES FITTING STANDARD RIMS.

Tires	Rims	Tires	Rims	Tires	Rims
29x3½	28x3	33x4½	32x4	35x5	34x4½
31x3½	30x3	35x4	34x3½	37x5	36x4½
31x4	30x3½	35x4½	34x4	37x5½	36x5
33x4	32x3½	37x4½	36x4	39x5	38x4½

who gives the proper pressure and does not make exceptions, and his knowledge is acquired by years of experience.

The popular suppositon is that the heat generated by tire friction on the road is such as to considerably increase the pressure of the air in the shoe and that this causes blow-outs. The remark, "It is a bad day for tires," is heard frequently in hot weather. The fact is that the tires are more or less worn; that the fabric is loose or broken, and that the heat causes the structure to soften at the weak point. The blow-out naturally follows. The increase of pressure created by heat is so slight as to be a neglible factor.

Some motorists complain that their cars ride too hard with the shoes inflated to pressure and make it a practise to under-inflate. No one will question the right of an owner to use his tires as he sees fit, but soft shoes are a luxury. And, unfortunately, some of these motorists are as equally insistent upon an adjustment as those who conform to the instructions of the maker.

It is safe to assert that a large percentage of the "easy riding" class does not realize the great stress upon the shoe when improperly inflated. The dropping of a wheel into the gutter, a depression, a hole, or striking a stone, etc., produces an impact that breaks the fabric as the force of the blow is on the external structure. The flattening of the shoe and tube reduces the space containing the air under compression and the pressure for the moment is increased throughout the tube area, and there is a greatly increased strain at the point of contact. At high speeds the stresses obviously are augmented. With the shoe properly inflated the shock is more generally distributed; not localized as with the soft tire.

The policy of the car manufacturer to equip his product with larger shoes than formerly is appreciated by the experienced owner, but these large shoes do not relieve him of the necessity of giving them attention or maintaining them at the proper pressure. It is as imperative to properly inflate over-size tires as smaller ones. Tables giving the weights a wheel that different sized tires are constructed to carry are given herein, and these will be of value to the owner in checking up the weight of the car. The machine should be fully loaded; that is, with the seats occupied, tanks filled and with full equipment. Previous to the time when manufacturers completely equipped their product the owner fitted accessories weighing hundreds of pounds, thereby often overloading his tires. As there are many cars still in service, which were equipped by the purchaser, due consideration should be made for the extra weight in the selection of new shoes.

The proper method of weighing the machine is shown in an accompanying illustration. First, make a chalk mark on the step or running board to indicate the centre, then run the front wheels on the scale until the chalk mark coincides with the edge of the platform, as shown at A. To ascertain the axle load of the rear wheels, reverse the operation. Dividing the end weights will give the load sustained by each wheel and tire.

If the machine is found to be under-tired a larger size should be fitted when new casings are needed. This does not necessarily mean changing the rims as the tire manufacturer produces special or odd sizes which are interchangeable with standard rims. An accompanying table presents the standard rims and the odd sized shoes that may be fitted to them. It is a simple matter to figure out the required size by adding an inch to the wheel size of the casing and half an inch to its diameter; for example, a 32 by 3.5-inch rim

GIVING MAXIMUM LOADS DIFFERENT SIZED TIRES ARE DESIGNED TO CARRY ON FRONT AND REAR WHEELS.

Size	Load a Tire in Pounds Rear	Front	Size	Load a Tire in Pounds Rear	Front
28x2½	225	275	37x4	775	925
30x2½	225	275	38x4	800	950
28x3	350	425	40x4	850	1000
30x3	375	450	42x4	900	1050
32x3	375	450	32x4½	750	950
34x3	400	500	34x4½	900	1125
36x3	425	500	35x4½	950	1175
28x3½	425	500	36x4½	1000	1250
29x3½	425	500	37x4½	1025	1275
30x3½	450	550	38x4½	1050	1300
31x3½	475	575	40x4½	1125	1375

35x4	725	875	40x5½	1350	1600
36x4	750	900			

will take a 33 by four-inch tire. Many owners in purchasing new shoes make it a practise to fit larger members, thereby reducing the cost of tire

Digitized by Google

upkeep as well as adding to the easy riding qualities of the machine. It is not practical, however, to utilize one 33 by four-inch tire and one 32 by 3.5 on the rear wheels, for example. The sizes should be the same. In connection with this matter of special shoes should be mentioned the necessity of using the proper sized inner tubes, as one too small will burst while a larger one will wrinkle and chafe the casing.

Too much emphasis cannot be laid upon the importance of keeping the tires properly inflated at all times, and although the maker's instructions are generally complied with when fitting a new tire they are not always followed afterward. A tire or pressure gauge is inexpensive, is easily utilized and with it but a few minutes are required to test the shoes. Even the extra inflated members carried on the running board should be tested before being used and should the pressure be below that recommended by the maker they should be pumped up before being fitted to the rim.

The inflation or air pressure in pounds recommended for 21 different makes of tires by their manufacturers is presented in an accompanying table and the cross sections of the casings are also given. It will be noted that the figures vary slightly, some makers advocating an air pressure a square inch of 18 times the cross section, while others recommend 20. The practise of inflating a shoe until it stands up round under load is not reliable, although indulged in by many owners. The only method is to utilize the pressure gauge.

Cuts, no matter how small, allow dirt to work in between the rubber and fabric, not only destroying the latter, but the abrasive action of the grit separates the tread from the breaker strip, etc. The fabric is also exposed to moisture, which causes it to deteriorate.

If the following suggestions contributed by the tire manufacturer are heeded, maximum efficiency will be secured from the shoes and the cost of the upkeep of the motor car will be greatly reduced thereby:

Keep tires properly inflated.
Clean and repair all cuts.
Examine casings periodically.
Take corners at slow speed.
Keep wheels aligned.
Apply brakes easily.
Use throttle instead of brakes.
Keep out of car tracks.
Engage the clutch gently.
Keep rims and rings clean.
Clean new casings before applying.
Examine interior of shoe for loose fabric.
Exclude light and moisture from new casings.
Remove all grease or oil from rubber.
Over-tire car if possible.
Keep brakes properly adjusted.
Jack up wheels when car is not in service.

LUBRICATING VALVE STEMS.

When grinding in the valves their stems should be thoroughly cleaned and lubricated before being replaced. These and their bearings in the cylinder are subjected to considerable wear and in time auxiliary air will find its way into the cylinder, causing missing at low motor speeds. Grease does not serve as the heat of the motor causes it to dissipate. The best method is to smear the stems with a grease graphite or the powdered material.

HOME MADE METAL POLISH.

A good metal polish for brass, nickel or silver can be made easily and at slight expense by taking two parts alcohol, one part ammonia and whiting enough to form a liquid having a cream-like consistency. This is smeared over the work and allowed to dry, after which it is rubbed off with a fine cloth. The alcohol and ammonia dissolve all dirt and oxides, which are absorbed by the whiting and removed when the powder is brushed off.

CORRESPONDENCE WITH THE READER.

Large vs. Small Wheels.

(1528)—Why is it that large wheels and tires make for more comfortable riding in an automobile? Is there any advantage in tires of large diameter; that is, is a wheel 42 inches in diameter shod with 3.5-inch tires better than one 34 by 3.5? INTERESTED.

Alexandria, Va., April 29.

As a general rule the larger the wheel the smaller the shocks experienced in passing over obstructions or inequalities in the road. Thus a wheel five feet in diameter will sink only one-half inch in a rut a foot wide, while a 30-inch wheel will sink nearly three times as deep. This is illustrated in the drawing presented herewith, the diagram showing the relative drop into a road rut between a small wheel and one twice its diameter. It is obvious that the smaller member will be subject to greater shock than the larger as the latter rises less quickly over obstructions.

It is held that it is a distinct advantage to enlarge the diameter of motor car wheels to offset the concussions experienced on rough roads. As a 42-inch wheel does not make as many revolutions to a mile as one of 34 inches, there is less wear on the former. Less friction is developed and if the wheel be tired properly the road resistance to its steady and even rotation is decreased as the square of the increase of its diameter, a wheel 60 inches in diameter decreasing the resistance in a ratio of between 50 and 70 per cent., as compared with a wheel of 30 inches in diameter. The larger wheel must be properly constructed in order to neutralize the effects of torsional motor effort, and disproportionate road resistance.

Brake Horsepower.

(1529)—In the descriptions of new cars published in your book I frequently note that the brake horsepower of the motor is greatly in excess of that rated by the S. A. E. formula, and that the rating is given for so many revolutions a minute. What is the brake horsepower and how is it measured? What have the revolutions to do with it? HORSEPOWER.

Mercer, Penn., April 24.

In the determination of horsepower the time element is an important item in all formulae. This is true because the power to be calculated produces motion and is not simply a static pressure to be measured in terms of pounds weight. In calculating for a gas engine, also, it is important to remember that the power efficiency increases with the rate of motion, being expressed in terms of revolutions a minute of the flywheel or crankshaft. Thus, a given engine running with low gas supply or high load may be able to rotate the flywheel only 200 times a minute, while with full supply of gas, or at average load, it can produce as many as 2000 revolutions a minute. Furthermore, the available power decreases as does the number of revolutions a minute, while, as has already been stated, the rate of gas consumption a unit of work is increased. In making estimates for horsepower it is important to know whether the engine in question is running free or under load. This fact is generally specified in reports of engine power and operation, and is considered in several formulae.

A method of testing the effective power is by the use of Prony's brake, a form of which is shown in an accompanying illustration. Briefly, it consists of a band of rope or strip iron (the latter arrangement is shown), to which are fastened

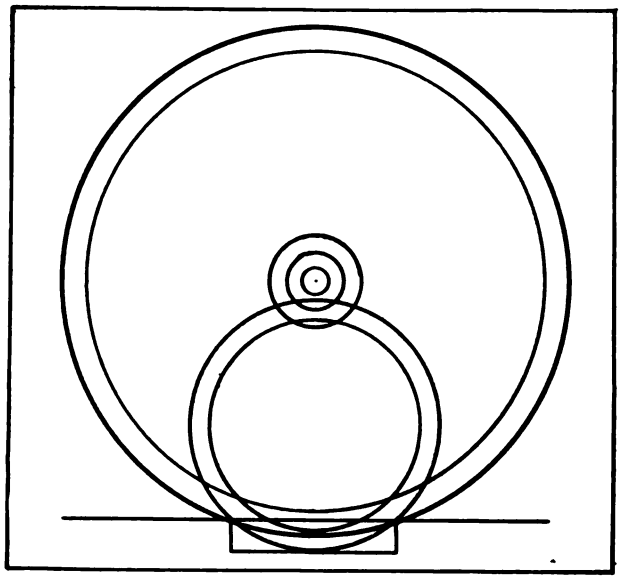

Diagram Showing Relative Drop into a Rut Between a Small Wheel and One Twice Its Diameter.

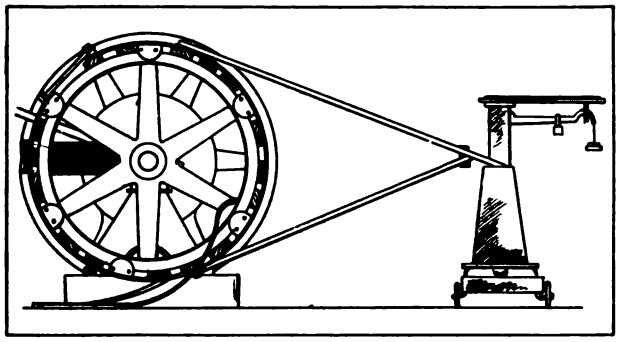
a number of wooden blocks, several carrying shoulders to prevent the contrivance slipping off the wheel rim. Being applied to the circumference of the flywheel the brake band is drawn tight, so that the blocks press against the surface all around. The brake, thus formed, is prevented from revolving with the flywheel, by two arms, attached near the top and bottom centres of the wheel, and joined at the opposite ends to form a lever, which bears on an ordinary platform scale, a suitable leg or block being arranged to keep its end opposite the centre of the shaft.

By this arrangement the amount of friction between the brake band and the revolving wheel is weighed upon the scales. For since the brake



Digitized by Google

fits tightly enough to be carried around by the wheel, but for the arms bearing on the scale, the amount of frictional power exerted by the wheel in turning free within the blocks may be transmitted and measured, just as would be the case were a machinery load attached, instead of a friction brake.

The factors in estimating the power developed are: The circumference of the wheel, the length of the leverage, measured on the line drawn from the centre of the rotating shaft to the centre of the scale platform; the number of revolutions a minute, the weight in pounds registered by the scales, less the static weight of the brake lever arms and block resting on the platform. With this form of Prony brake the formula for delivered horsepower is as follows:

$$\frac{w \times n \times l \times c}{33{,}000} = \text{B. H. P.}$$

in which w is the net weight as shown by the

Common Form of Prony Brake for Estimating Power of a Motor.

scale; n, the number of revolutions a minute; l, the length of the leverage; c, the circumference of the braked flywheel. Their product gives the number of foot-pounds developed; the quotient of the indicated division by 33,000 gives the efficient horsepower. If, therefore, a given engine has a flywheel of 16 inches diameter, revolving at 600 revolutions a minute, and giving 27.5 pounds at the scale, with a leverage of five feet, the result is, according to the above formula:

$$\frac{27.5 \times 600 \times 5 \times \frac{3.1416 \times 16}{12}}{33{,}000} = \frac{345592.5}{33{,}000} = 10.47 \text{ H. P.}$$

The diameter, 16 inches, being multiplied by 3.1416, the expression for the ratio between the circumference and diameter of a circle, gives 50.2656 inches, which, if divided by 12, gives 4.189 feet, approximately.

In some forms of Prony brake the block bearing the rope or band, instead of being secured as shown in the drawing, is attached to the floor and ceiling, two dynamometers or spring balances being interposed.

Belt and Pulley Transmission.

(1530)—Was a belt and pulley transmission ever used on automobiles? I had an argument with a repairman who states that it was. I contend that chain drive was the first form of transmission. Who is right? J. E. D.

Galveston, Tex., April 30.

The repairman is correct. The belt transmission was utilized with the early Daimler carriages and consisted of four pulleys regularly increasing in size, keyed to the main shaft, and four others regularly decreasing in size in the same order, keyed to the countershaft. Four belts connected these eight pulleys, and the power was thrown upon any one pair as desired, by tightening the belt with an idler pulley mounted on a suitably disposed bell crank. By this method it was possible to obtain four speeds forward on an even road, or to vary the power in ascending grades. There was no provision for reversing, the carriage being turned around by power or by hand.

Noisy Transmission.

(1531)—I have a car fitted with a planetary transmission which has been in service some time. The transmission is very noisy on the low speed and reverse, but quiet on the high. What can be done to quiet the noise? Can I use a certain grade of oil or grease or is there some preparation made for this kind of transmission? Is the noise due to the parts being worn out and would fitting new ones stop it? I am told that planetary transmissions are always noisy. Is this correct?

SUBSCRIBER.

Paterson, N. J., May 1.

From the description it would appear that the noise is largely due to the gears being worn. The transmission is quiet on the high speed because no gears are in operation and the drive is direct. The use of a heavy grease may help some, but if the casing is not tight much of the lubricant will be lost. The Joseph Dixon Crucible Company, Jersey City, N. J., makes a preparation for planetary transmissions which is said to be effective where gears are noisy. The replacing of the worn gears with new would be expensive and with some types of planetary transmissions the cure would only be temporary. If the car is an old one it would hardly pay to fit new parts as suggested.

Auxiliary Mixing Devices.

(1582)—I note there are a number of devices for improving faulty carburetion and that they are placed in the intake pipe between the carburetor and the cylinders. Can you inform me if they are practical? Will they cut down the gasoline bills as claimed? I have a motor and find it difficult to get a good mixture at high and low speeds. If I set it so the engine will start easily and

Digitized by Google

throttle nicely at low speeds, it will flutter at high. If set so as to run good at high speeds, say 20 miles an hour, it will miss at low. Have had several reputed carburetor experts set the carburetor, but they do not get any better results than I do. Can you give me any idea as to the trouble?

Meriden, Conn., May 3. W. H. S.

The devices referred to are designed for providing a uniform mixture, the principle involved being that of breaking up the globules of raw fuel and mixing them with air. There are several makes on the market and the fact that the companies have been in business for some time would indicate that the devices accomplish the results claimed for them. The writer has not had any experience with the mixers, but knows of several cases where they have been installed with success.

Regarding the trouble experienced in setting the carburetor it would appear that either the needle valve is too large or too small, or that the motor was taking in auxiliary air. As the make of the carburetor was not given, suggestions as to the cause of trouble cannot be made with any degree of accuracy.

The fact that the mixture must be slightly rich at low speeds would indicate auxiliary air. When the motor is operating slowly and auxiliary air is being drawn in, the mixture is diluted. This would not be so noticeable at high speeds. With the carburetor set with a rich mixture at low speeds, it would be too much so at high.

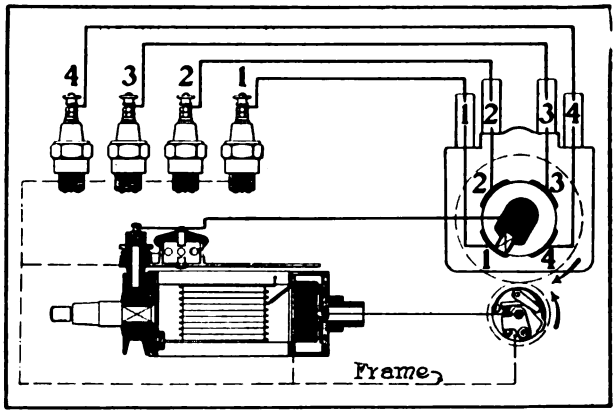
Examine the connections between carburetor and intake pipe and those between the manifold and cylinders. If the valve guides are worn badly, auxiliary air will find its way to the cylinder. It may be possible that the trouble at high speeds is due to the auxiliary air valve sticking.

Wiring Bosch D U 4 Magneto.

(1583)—Will you kindly give me the wiring plan of the Bosch magneto used on Cole cars?

THOMAS WHEELWRIGHT.

Freeport, Me., May 4.



The Bosch D U 4 magneto was employed on former models, but the 1913 Cole is fitted with the Delco system. The wiring plan of the Bosch is presented in an accompanying illustration and it is one of the simplest as the instrument is a true high-tension; that is, the secondary current is mechanically produced without the aid of step-up coils or transformers.

But five wires are required for a four-cylinder unit, four of these being the leads from the distributor terminals to the spark plugs. The fifth wire is led to the switch, thence to the frame of the car, being employed for grounding the primary current when the operator desires to stop the engine. This differs from the other types of magnetos in that the wiring is simplified and the motor may be started easily on the magneto itself.

The wiring plan shown does not give the firing order of the motor, the leads being made in order. However, it is an easy matter to wire correctly by ascertaining the firing order of the motor, which will be either 1, 3, 4, 2 or 1, 2, 4, 3.

First note the direction of drive of the magneto. The rotation of the distributor arm is opposite thereto as it is gear driven off the armature shaft. This is shown in the drawing, an arrow denoting that the armature shaft revolves to the left or anti-clockwise and that the distributor arm rotates to the right or clockwise.

Assuming that the motor fires 1, 3, 4, 2: Connect the terminal of the distributor marked 1 in the drawing with the spark plug of the first cylinder. As the third cylinder explodes next, wire the terminal marked 2 with the plug of the third cylinder. The fourth is next in order, so connect

Wiring Plan of Bosch D U 4 True High-Tension Magneto.

the terminal marked 3 with the fourth cylinder. The last to fire will be the second cylinder, to which is connected a wire leading from the terminal 4.

It will be noted that there is a knurled nut or terminal which holds the spring or lever extending to the cover of the circuit breaker box. This is the ground member and an insulated wire is led from this to the switch. The other post of the switch is wired to the frame of the car. When the switch is open the magneto will supply a current to the plugs, but if closed the primary current will be diverted to the frame, preventing the generation of a secondary current.

The St. John Motor Club is planning a tour from St. John, N. B., to Boston, leaving St. John, Aug. 9, and travelling by way of Lepeaux and St. George along the coast to Calais, inland to Bangor, and Portland, Me., to Boston and return.

WITH THE MOTORING INTERESTS ABROAD.

Features of New Helios Wire Wheel, Made in France—Analysis of International Stock Car Race—Discussing American Invasion—Foreign News Notes.

A NEW demountable wire wheel has been produced in France under the name of Helios, the principal feature of which is the simplicity of the locking means. Engineers who have had opportunity to study the construction are of the opinion that the inventor has adapted the mechanism which closes the breech of the Lebel rifle, a gun that is somewhat familiar to those who have done military duty in the French barracks. The components are presented in accompanying illustrations and a little study will reveal the method of operation.

It will be noted that both the removable hub and the fixed hub, the latter being mounted on ball bearings, are in the form of a truncated cone, the drive being taken by the members F and H, Fig. 3, these bearing against similar members on the interior of the removable hub. Thus far, the

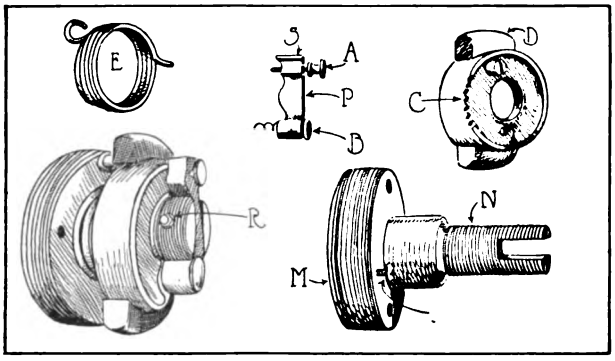

Fig. 1—Components of Helios Wire Wheel Locking Device.

construction does not differ materially, at least in principle, from the usual practise, and the chief point upon which the Helios patent is granted is the means for keeping the wheel in place after it is mounted on the fixed hub.

The device comprises four separate pieces, and is shown assembled and disassembled at Fig. 1. The base plate at M screws upon the cylinderical end of the fixed hub and remains permanently attached thereto, being protected by the cover L, Fig. 3. It is only necessary to release this to apply lubricant to the bearings, which is held to be very seldom. It is terminated by a threaded mandrel N.

A spiral spring E is attached at one end to the base plate by a screw and the other to the locking nut D. It is maintained that the tension of this spring is such that it automatically takes up all play between the fixed and removable hubs.

The locking nut with its winged projections is screwed over the threaded mandrel, and is so located as to pass through the opening in the removable hub seen at G, Fig. 3. It is then given a quarter turn, so that the projections bear against the exterior surfaces of the removable hub, and apparently assist in taking the drive.

The safety lock P is a simple lever which engages with the mortise in the threaded mandrel and bears against the outer face of the locking nut. It is fixed at its central point upon a small bolt R, termed an axle, in such manner as to be able to take up the slight oscillating movement of this axle, but without being permitted to turn with the locking nut. One end of this fastening has a bevelled projection S, which engages with teeth C on the edge of the locking nut. A screw A bears upon the external face of the device, while a spiral spring B acts upon the opposite end of the fastening. Of course, a hub cap holds the assembly in position as indicated at Fig. 2.

To remove the wheel it is first necessary to displace the hub cap. Then the screw A is turned backward as far as it will go, after which it is possible to oscillate the safety lock, little by little, until the projection S is released from the notches C. Next the locking nut D is turned a quarter turn and the wheel is free to slip over the projections. Its replacement is a reversal of this operation.

ISLE OF MAN RACE.

Society of Motor Manufacturers & Traders Forbids Members to Take Part.

The proposed international standard or stock car race under the auspices of the Royal Automobile Club of Great Britain on the Isle of Man in September is not meeting with the success that was anticipated, judging from the fact that the Society of Motor Manufacturers & Traders has issued a warning to its members not to enter. British motoring prints state that this does not necessarily mean that the race will not be held, but only that a majority of the council of the society objects to it.

Digitized by Google

A careful study of the conditions and of the American machines eligible to compete under them, indicates that the promoters hardly could have expected a large entry list from the United States. The first provision is that only four-cylinder cars with bore not to exceed 90 mm (approximately 3.5 inches) and stroke not to exceed 140 mm (5.5 inches) are eligible. The list of stock cars in America shows the following eligible:

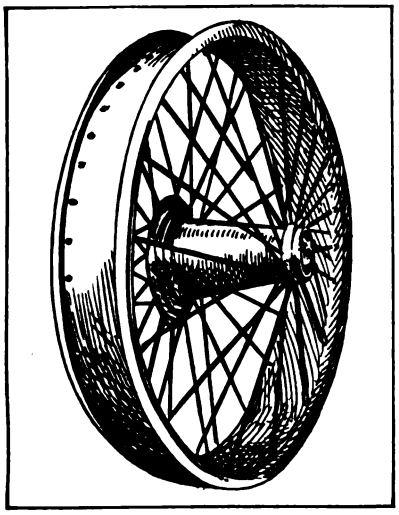

Fig. 2—Helios Wire Wheel Completely Assembled.

Make and Model	Bore	Stroke	Piston Dis.
Detroiter A	3.38	4.75	170.0
Dispatch G-2	3.50	5.00	192.4
Empire	3.50	4.50	173.2
Herreshoff 4-30	3.38	4.50	161.0
Hupmobile C	3.25	3.38	112.0
Hupmobile H	3.25	5.50	182.5
Lambert 40	3.25	5.25	174.2
Little Four A	3.50	3.38	129.9
Marathon Runner	3.50	4.50	173.2
Oakland 35	3.50	5.00	192.4
R-C-H	3.25	5.00	165.9
Studebaker 25	3.50	5.00	192.4

This gives a list of 11 makes from which to select an American team, and it may be assumed from the first that some of these manufacturers will not make their initial appearance in contest work of this character in the Isle of Man event. Already a movement has been started in England to so change this condition that machines which do not exceed the piston displacement of these dimensions, 3561 cubic centimeters (about 217.3 cubic inches), shall be eligible, in which case the list of American possibilities would be increased by the addition of the following:

Make and Model	Bore	Stroke	Piston Dis.
Buick 25, 24	3.75	3.75	165.6
Buick, 31, 30	4.00	4.00	201.1
Cameron 29A	3.87	3.75	176.9
Crow Elk-Hart C-1	3.75	4.50	198.8
Ford T	3.75	4.00	176.7
Franklin G	4.00	4.00	201.1
K-R-I-T K	3.70	4.00	172.1
Maxwell 4	3.75	4.00	176.7
Metz 22	3.75	4.00	176.7
Paige 25	3.75	4.00	176.7
Perfex 2	3.75	4.50	198.8
Regal T, N	3.75	4.50	198.8
S. G. V. A	3.75	4.38	193.3
Studebaker 20	3.62	3.75	154.8

It thus will be seen that there is a grand total of 23 makes out of something over 150 produced in this country that are eligible for this international event. And it must be remembered that the Isle of Man race was organized following a suggestion of an English motorist that a competition be arranged in which American and British cars might have ample opportunity to test their relative merits.

ELECTRIC LIGHTING TESTS.

Special Regulations Covering Certified Trials by Royal Automobile Club.

As announced in a recent issue of The Automobile Journal, Country Life of London, England, has offered a cup for the best electric lighting system to be installed on motor cars, the competition to be decided by the technical committee of the Royal Automobile Club of Great Britain. This is of particular interest for the reason that electric lighting has not received the same attention abroad that it has in this country, very few cars being marketed with such equipment as standard. The Royal Automobile Club has prepared the following special regulations governing the tests:

1—Entries must be made under the general regulations for certified trials. No entry will be accepted after Sept. 15, 1913.

2—The whole equipment must be entered for trial, and must be properly installed upon a car.

3—The distance run upon the road shall not be less than 2000 miles.

4—All lamps (not less than two head lamps, two side lamps and one tail lamp) shall be alight at the same time and for at least six hours a day.

5—The technical committee of the R. A. C. shall decide which of the performances as shown in the trials certificates is the best.

6—Any equipment which completes its trial before Oct. 15, 1913, will be eligible.

7—The following data (inter alia) will appear upon the certificates, and any equipment entered for a certified trial in order to compete for the prize will be subjected to such tests as may be necessary to obtain such data:

a—Full description of equipment entered, including battery, and its fitting to car, together with weights of parts, and the wattage and candlepower of the lamps.

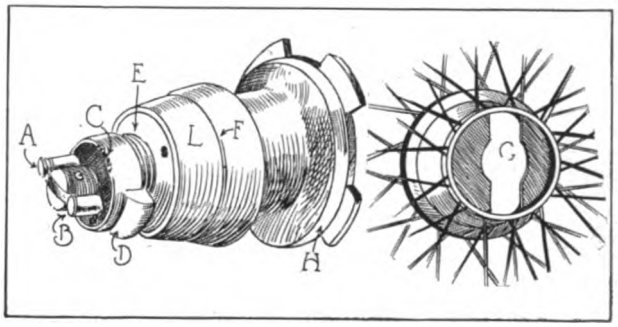

Fig. 3—Fixed and Removable Hubs on Helios Wire Wheel.

Digitized by Google

b—Total distance run.
c—Number of lamps expended.
d—Wear of parts during trials and general condition after trial of the equipment, including accumulator.
e—The behavior of the equipment at different car speeds on the various gears during tests on Brooklands track.
f—The convenience of the adjustments of the dynamo, control of the lamps.

In the absence of definite information to the contrary, it is assumed that the competition is to be international in character.

WHOSE SHOE PINCHES?

British Writer Presents Some Very Interesting Hints Anent American Invasion.

Writing in The Autocar, a British motoring print, someone who signs himself Runabout has some very interesting remarks to make concerning the so-called American invasion. Under the title of "Whose Shoe Pinches?" he says:

I am afraid there is a certain amount of hypocrisy anent the American influx. Quite a number of the importing concerns are run by British brains and British capital. Quite a decent proportion of the shares in several leading American factories are held by British investors. Quite a good percentage of the profits on sales of American cars in this country goes into the pockets of British agents. So far as dividend-earning goes, the so-called invasion is a gold mine to many a British capitalist, both small and large. Many a country mansion and many a suburban villa form pockets for the gold that comes of the large sales of the imported cars, and many a financier, big and little, interested in the motor trade would prefer things to remain as they are. He is making money out of small cars, without the trouble of securing a design, building a factory, or organizing a demand. The same is true of many a shallow-pursed motorist. He is getting a cheap car, which suits him indifferently well, and so long as it runs quietly and costs little to maintain, he does not worry very much what its country of origin may be. The real sufferers—if any—are the British workmen and those towns who are in search of new industries; and neither workmen nor municipalities can lay down the capital requisite to cope efficiently with the huge motor manufacturing concerns of Detroit.

CHAMBER OF MOTOR EXPERTS.

Body Formed in London to Advise and Assist Inventors and Investors.

D'Arcy R. Baker, Robert W. A. Brewer, Hamilton Hobson, Charles Jarrott, Arthur F. Mulliner, A. S. Mays-Smith and James A. Tinling, all more or less well known in British automobile circles, have formed the London Chamber of Motor Experts with offices at 13 Finsbury Circus, E. C., London, England, to consider and report upon new inventions and patents generally, also to furnish information and advice to investors. The plan is somewhat new to the industry and is set forth in the following statement concerning those to whom it is expected to appeal:

To one who has an invention with the means to exploit it, but is doubtful as to whether the invention has practical value and is a good commercial proposition.

To the inventor who has a good thing but no money to exploit his patent.

To the parent, who, perhaps, wishes to put a son in the motor business and invest a substantial sum of money with him and has no means of ascertaining as to whether the venture is a good one or not.

Where a firm requires financial support and the lender wants to know from experts as to whether the venture is good enough to lend money to.

NOTES FROM FOREIGN LANDS.

The Royal Hungarian Automobile Club will hold an eight-day endurance run from Budapest, May 25-June 11. The distance to be covered is about 1312 miles.

The Automobile Club of Milan, Italy, is organizing a race for small cars to be held in September. It is anticipated that the course selected will be over the Brescia circuit.

Twelve entries have been filed for the race for the Coupe de l'Auto, which is to be run in France, Sept. 21, as follows: Peugeot, three; Delage, two; Koechlin, four; Th. Schneider, three.

The entry list for the French Grand Prix has been closed, with 20 cars, divided according to countries as follows: French, nine; British, four; Italian, three; German, two; Belgian, two. The total distance to be covered is 580 miles.

Citizens of Shanghai, China, recently combined to present Dr. S. M. Cox, a prominent British physician, with an American made Regal touring car, as a recognition of his services in checking a cholera epidemic in that country. The presentation speech was made by Dr. Wu Ting Fang, on behalf of the Chinese Red Cross Society.

The First Baltic Automobile Club of Riga, Russia, will hold a reliability run some time early in July. It is planned to take the cars by steamer from Riga to Stockholm, from which point the way will lead through Dalecorlia and Gothenburg back to Stockholm. It is probable that the club will be assited by the Royal Swedish Automobile Club.

The Chambre Syndicale de l'Industrie du Petrole of France has decided to offer two prizes of $1000 and $50 respectively in a competition to arrive at the best means of utilizing kerosene in automobile engines without the assistance of gasoline for starting purposes. The trials will be conducted under the auspices of the Automobile Club de France.

The question of holding the Paris Automobile Salon in October is still in abeyance owing to the difficulty of securing the Grand Palais at that period. The proposition of reducing the duration of the show from 15 days to 10, advocated by the manufacturers, is meeting with some opposition on the part of the exhibition committee, on the ground that it will curtail the receipts. On the other hand the prospective exhibitors maintain that there should be a corresponding decrease in expense. A further suggestion is made that the show be open in the evening until 7:30 instead of closing at 6 as formerly, this giving business people an opportunity to inspect the models without inconvenience.

The population of Bordeaux, France, is 262,000, and of the Department of the Gironde, 829,000. Including Bordeaux and its surrounding territory the population is 3,200,000. Possibly one-tenth of the population possesses the means to indulge in motoring in the sense of continued proprietorship of a car. This would provide for about 60,000 cars. There is a fair number of pleasure motor vehicles in the cities, but touring, despite the excellence of the French roads, has not come into such general favor as in the United States. There is no prejudice against American machines as such because the people of the district know nothing of them. The only inducement for them to purchase an American car would be the establishment of a stock and repair shop on the ground and ready for business, something which does not now exist.

AMERICAN TIRES IN EUROPE.

Evidence of Foreign Demand Lies in Increased Shipments Each Year.

It is admitted by J. D. Anderson, general sales manager of the United States Tire Company, New York City, that in the building of automobile tires Europe had the start of this country by several years, but he adds that American manufacturers have progressed so substantially in the development of pneumatic shoes that today they have proven themselves keen contenders in the foreign field. His concern has sold a large quantity of Nobby Tread tires in St. Petersburg, Russia, and one firm in Stockholm, Sweden, has installed 750 sets in taxicab service. Other extensive shipments have been made to Porto Rico, South America, Mexico and the Orient. In discussing the situation Mr. Anderson says:

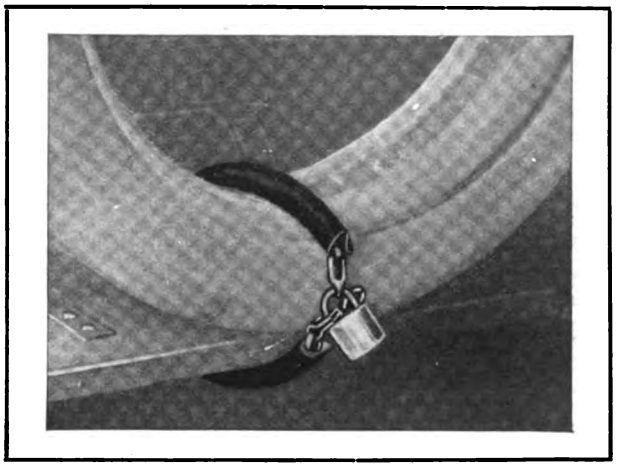
Tires manufactured in this country have the advantage of a rugged construction, made necessary by the wide variety of road conditions which must be met in our native service. When a man starts touring in the United States, taking the highways as he finds them, mile in and mile out, he must be prepared to negotiate roads ranging from good to extremely bad. And if he is to get anywhere he must have tires sufficiently strong and adaptable to withstand the strain of extremely hard service. The American manufacturer must build tires of this character if he expects to satisfy the consumer.

In Europe it is different. You may tour for hundreds of miles without encountering a bad stretch of road. Consequently, the strain on tires over there is not so great. Therefore, when American tires are placed in service on European roads and against European tires, the rugged qualities built into them to meet our native conditions, assert themselves in increased mileage.

Experts who have made comparative studies of manufacturing methods and results in Europe and America fail to see wherein Europe, in spite of its long experience, has any advantage over us in tire building. And the more we compete in foreign countries the more this conclusion seems to be borne out. The tire product of this country is making good all over the world and with the wonderful export business being done in American cars, I see no reason why the native tire trade abroad should not broaden out every year.

KEETON IN FOREIGN LANDS.

Demand in America and Abroad Makes an Increased Output Necessary.



Although the Keeton Motor Company may be regarded as one of the newer concerns in Detroit, the product having been on the market something less than a year, its reputation appears to have reached all parts of the world. Cable orders for Keeton cars to be shipped immediately to Roumania, Argentine, Russia, Philippines and Japan have been received recently.

It is understood that several export houses in New York have applied for foreign agencies, and the pressing demand in this country and abroad has made it necessary to increase the output of the Keeton factory very materially. Night and day shifts will be engaged for some little time in an effort to keep up with the orders from this country and abroad.

PROTECTING CAR'S EQUIPMENT.

New Automobile and Tire Lock Produced by American Chain Company.

A new accessory which is expected to meet with the approval of the motorist who desires to be assured that the movable equipment of his machine cannot be tampered with in case he should leave his car unattended for a few minutes or a few hours is the American automobile and tire lock, made by the American Chain Company, Sherrill, N. Y. An accompanying illustration shows the lock in place and indicates its method of use.

American Chain Automobile and Tire Lock.

These chains are three feet long, simple, strong, and when not in use take up little space in the tool box. They are held to possess a number of advantages because of the flat links, which give them a strap like action and permit of being drawn closely around extra shoes on the running board, or through the wheel, spring or frame, thus affording real protection. They are moderate in price and may be had covered with duck, pantasote or leather. They also may be purchased without the lock if desired.

The following distributing agents have been appointed: F. E. Sparks, 1430 Michigan boulevard, Chicago; Petry-Cassidy, Inc., 1427 Vine street, Philadelphia; T. A. Cotter, 109 Massachusetts avenue, Boston, and Hughson & Merton, Inc., 530 Golden Gate avenue, San Francisco.

TRANSPORTATION AND GOOD ROADS.

The motor truck is not to be considered by legislators in the same light as the so-called pleasure car. There is little doubt that motorists originally made a mistake in virtually agreeing to a propositon in which they permitted their cars to be taxed for good roads under the guise of a registration fee. This has resulted in a tendency upon the part of the legislators to deem automobile owners a legitimate source from which to secure additional income whenever the need for better highways is felt most acutely.

The American Automobile Association is seriously contemplating the matter of testing the registration laws before the United States supreme court. It will be remembered in this connection that in one case brought in New Jersey it was held by the state courts, in effect, that a fee could be levied provided it did not raise any considerable revenue, more than enough to pay the running of the highway department, and that such a fee was not a tax. The inference seemed to be that a fee which provided a sum sufficiently large was a tax and could not be levied. The question was raised in its application to interstate commerce.

The motor truck is a business proposition. It can be demonstrated to the satisfaction of anyone at all interested in economics that the more general adoption of the mechanical transport is a progressive step. This being true, there is every need for a revision of the viewpoint from which the problem of the motor business vehicle and its application to the good roads situation has been considered.

Sufficient data have been compiled to afford a scientific study of the question by engineers, and it is possible to have available such information as the legislators need. Any attempt to avoid meeting the situation squarely has the effect of delaying the inevitable. Certainly, nothing is to be gained by imposing restrictions which must result in embarrassing the business man who is seeking the proper solution to the modern transportation problem.

There is abundant evidence that the manufacturers are giving every attention to the fuel problem, and in view of the reports that are being made public from time to time, the advent of the successful kerosene carburetor does not appear to be far distant. England and Continental Europe are turning their attention to benzol, but the American inventor seems to be confident that the solution of the problem lies in a product more closely related to the type of hydrocarbon originally selected for automobile use. One reason for this undoubtedly hinges upon the suggestion that when both kerosene and gasoline become available as fuels, there will be such adjustment of price as to make the cost of either satisfactory from the standpoint of operating expense.

It is hardly necessary to recall that a large majority of motorists deplore the fact that there is a class of drivers who seemingly have little regard for the rights of others using the highways, but it is manifestly unfair to the rapidly increasing body of automobile owners and users to include all operators in the same category.

CONCRETE BLOCKS FOR PRIVATE GARAGES.

Explaining Method of Manufacture and Advantages Claimed for Them--Detailed Estimates of Cost as Compared with Wood Structures of Same Dimensions.

SEVERAL factors must be considered by the motorist who is contemplating the erection of a private garage. If it were a matter simply of providing protection from the weather without giving thought to the possibility of needing additional room in which to work about the car, a serviceable wooden shelter doubtless could be built for a very little money. In at least one instance of record an owner constructed a garage of this character, doing the work himself, at a cost of $35. On the other hand, private garages have been built at an expense far in advance of what might be considered necessary or advisable, judging from the standpoint of practicability alone.

The subject of portable garages has been treated at some length in these columns, and while it is contended that these offer features which may be regarded as of value when considered for use during the entire year, reference is made herein to those buildings which are designed as a permanent addition to the property on which they are located. And special attention is drawn to the concrete structure, because of its ready adaptation in the solving of some of the problems which are held to be of prime importance.

Concrete is a mixture of cement, sand and gravel, with sufficient water to hold the mass together. Its most general application in building work of this character is in the form of blocks, although cement is utilized in other ways to form a stucco finish, or fastened to metal lath as under the so-called Kahn system. The concrete blocks possess an added feature of economy, in that the motorist may procure a mold and make them on his own property, although this plan undoubtedly would not prove practical were he contemplating the erection of but one small building, since the blocks may be purchased readily at small cost.

Four Steps in the Production of Concrete Blocks; Upper Left, Mixing the Ingredients; Upper Right, Shovelling Mixture into the Mold; Lower Left, Completed Block After Molding; Lower Right, Setting Away to Cure.

There can be little question as to the perma-

Digitized by Google

nency of the concrete structure. Those who favor this method of construction maintain that the building will be warmer than when built of

Concrete Block Garage in Process of Erection, with Workmen Engaged in Shingling Roof.

wood; that wind has no effect upon it, whereas it is practically impossible to keep a wood building from being draughty; that it is easier to keep clean; that there is no maintenance cost, and that it is absolutely fireproof. This last feature depends, of course, upon the character of roof utilized, and the material of which the windows and doors are composed. It may be conceded, however, that with a metal roof danger to other buildings arising from a fire within the garage, or to the garage itself from a blaze outside is minimized to an appreciable degree.

Charles K. Setchell of Providence, R. I., who has had wide experience in manufacturing concrete blocks and production of concrete work of all kinds, holds that the best results are obtained with a 1:2:2 mixture, while the usual formula is 1:3:5. The first figure refers to the proportions of cement, the second to sand and the third to gravel. The knowledge of the correct amount of water to be used is acquired by experience, and no definite rule can be made to apply. It will depend upon the moisture in the sand, etc., and it is held to be better to have too little than too much.

ESTIMATED COST OF WOOD GARAGES.

	A	B	C	D
Studs, rafters, plates, etc.	$10.00	$10.00	$10.00	$10.00

Totals	$275.00	$311.50	$331.00	$347.00

A, with gravel roof; B, wood shingles; C, slate shingles; D, asbestos shingles.

Accompanying illustrations set forth the manner of producing the blocks as done by Mr. Setchell. The sand is what is termed a good coarse grit sand, and the gravel ranges in size from that of a pea to that of a walnut. The object of the mixing is to cause the cement to fill all the minute holes between the sand and gravel, thus forming a solid block.

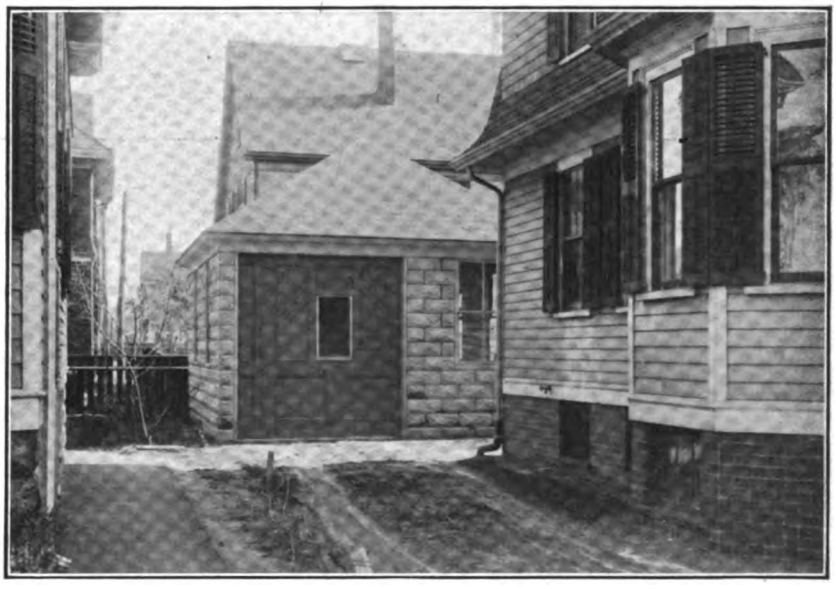
When the ingredients have been thoroughly mixed on the working floor with shovels and rakes, the mold is turned in an upright position and the mixture shovelled in, care being taken to ram it into all the corners. When the mold is filled, one side is let down and the completed block is transferred to a metal pallet made to receive it, and placed with others on a rack to season under cover for at least 15 days. At the completion of that time the blocks may be piled out of doors until needed.

Neat and Attractive Concrete Block Garage, Adequate for the Private Owner.

The difference in cost between the 1:2:2 block

Digitized by Google

and the 1:3:5, is held to be about one cent, and one of the advantages of the former is that it may be handled much quicker. Should necessity arise, it is claimed that this block might be used in 20 days, although the requirements of building departments in most cities make it impossible to use concrete blocks in less than 30 days.



The standard dimensions are eight by eight by 20 inches, although some blocks are made 22 inches long and others 24. The regulation charge is 15 cents a block. Two courses are laid side by side. With this information it is possible to estimate very closely the number of blocks necessary to construct a given building, and to so arrange matters that there shall be very little, if any waste.

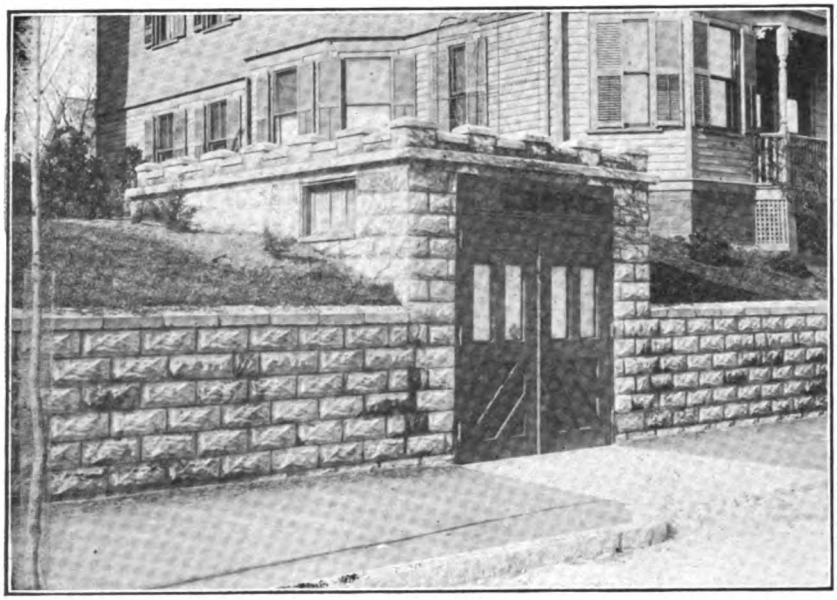
It will be noted that the blocks are made hollow; that is, there are usually two holes in the block itself, and the ends also are concaved to a certain extent, so that when two are placed together there is another hole between each pair of blocks. This arrangement is expected to keep out the frost and moisture to a certain extent.

When but one mold is used, of course, the blocks are all alike, and this is one of the objections that has been raised against the concrete building. However, it is possible to vary the monotony, when blocks are purchased from a concern making them in large numbers and where the conditions will warrant the manufacture of various styles for trimmings, etc. This is a feature which is being given more and more attention, and those who have devoted systematic study to the subject maintain that it is possible to do anything with concrete that may be done with cut stone.

For the purpose of comparing the cost of a simple concrete garage with that of a wood building of the same dimensions, a table of estimates is presented herewith. It will be understood that while these figures were compiled by those familiar with building operations, they are at best only an approximation, as the condition of the lumber and labor markets varies decidedly and they do not include what is regarded as the contractor's profit. They should serve, in some measure at least, as a guide for the motorist who is contemplating work of this nature.

In each instance the dimensions selected are for a building 20 feet long, 18 feet wide and eight high. The plans call for three windows, one on either side and one at the back, double doors in front and a smaller door at the side. The wood building A is to be covered with what is known as Novelty siding and to have a gravel roof. B is the same with the exception of wood shingles for the roof. C is with cypress sheathing on the side and a gravel roof, while D is with the same sheathing and wood shingles. The list might be extended still further by the addition of buildings utilizing other roofing materials—slate, asbestos, tin, asphalt, etc. Some of these would be flat, and the amount of lumber undoubtedly would be reduced, but not sufficiently to affect the increased cost of the roofing material to any appreciable extent, or the total estimated expense.

Even the Simple Design of Concrete Garage May Be Made to Harmonize with Its Neighborhood Surroundings.



Mr. Setchell estimates that for a building of this size the concrete blocks would cost $140. It will be seen that the same cement floor is considered for all the structures, and the flat rate of $25 also is his estimate. The labor charge is purely arbitrary, and is based on the estimate that it would take two men six days to erect any of these buildings with a gravel roof, or eight days where the roof must be shingled.

Experience will indicate that even where a man first sits down and carefully computes the cost of any building work, it is wise to allow something additional for incidentals. Therefore, the figures given in these tables may be considered as representing the lowest cost of the re-

Digitized by Google

spective items, and while there has been an attempt to include a reasonable allowance for waste, etc., the motorist who uses these as a guide need not be surprised if the completed structure exceeds the estimate given.

These figures indicate that even a simple concrete garage will cost anywhere from $50 to $100 more than a wood building of the same size. Mr. Setchell suggests that a concrete structure of these dimensions should cost anywhere from $350 to $450, depending upon the character of the roof. Inasmuch as one of the chief advantages of the concrete over the wood is that of being fireproof, it would seem injudicious to utilize wood shingles. The gravel roof is expected to protect a building from fires originating outside, but may be considered of very little more value than wood as a protection from fire arising within the garage.

Indicating Possibilities with Concrete Structure Where Conditions Will Permit of Somewhat Elaborate Treatment.

Probably the best protection for the roof would be either slate or asbestos shingles. There are a number of grades of the former, and the cost of laying is governed somewhat by the method employed. Properly laid, with copper ridge, etc., they should cost from 11 to 15 cents a square foot, although it would be possible to make this as much as 18 or 20. Asbestos shingles figure out from two to three cents a square foot more than slate. With these figures as a basis it would be necessary to add about $52 for slate and $64 for asbestos to the estimate for gravel roofs, and $34 for slate and $46 for asbestos to the estimate for wood shingles in the tables given herewith for wooden garages.

Photographs of some of the concrete garages erected by Mr. Setchell, or with blocks of his manufacture are reproduced herewith. It will be noted that even the plain concrete block building does not make an unattractive addition to the property, either when standing somewhat alone or when made to fit into the general scheme of the neighborhood. One of the illustrations indicates the possibilities where conditions are such as to permit of something quite out of the ordinary. In this instance, the garage is built into an embankment, and its front and side walls virtually form a continuation of the retaining wall. The roof is flat and is fitted with a parapet. On summer evenings it is utilized by the members of the family as in the nature of a piazza.

It will be understood that the dimensions selected for the comparisons made are based upon Mr. Setchell's experience of what is demanded in the average garage. They not only provide sufficient space for the car, but plenty of additional room for a work bench and some little machine tool equipment, or two cars could be accommodated. It is at all times wise to consider the possibilities of the future, and even if the builder does not contemplate owning two cars, he may find it advantageous to have the necessary room when friends from out of town are visiting, or he may be able to rent a portion of his garage to a neighbor.

One or two other points have not been touched upon in the estimates given. It is assumed, of course, that some means will be provided for carrying away the water, and this may include plumbing to connect with the local sewage system, or some less expensive arrangement. There also is the matter of lighting. Some other fittings may well be considered when laying the floor, these including a turntable, repair pit, base for machinery, etc. It readily will be seen that it is possible to make the garage cost almost anything the motorist is willing to pay.

Manufacturers of commercial and pleasure electric vehicles are to meet at Boston in a convention to be held May 20-21 in conjunction with other big electric interests.

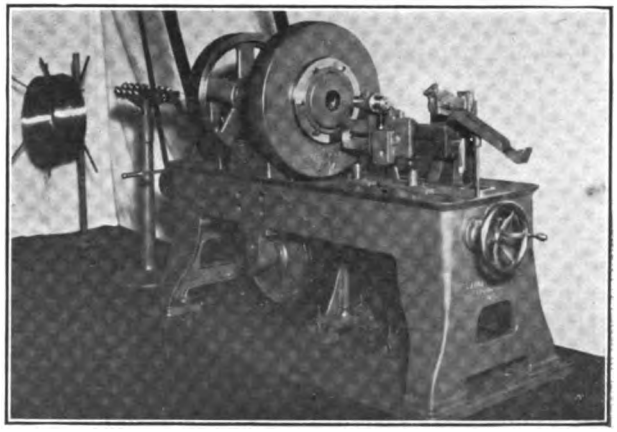
LANGELIER SWAGING MACHINE.

Designed for Rapid Work on Automobile Wire Wheel Spokes.



The increasing interest in wire wheels for automobiles extends to the machinery utilized in their manufacture. An accompanying illustration presents the swaging machine produced by the Langelier Manufacturing Company, Providence; R. I., for this class of work. It takes the wire from the coil, straightens it before entering the machine, swages the spoke between butts and mechanically cuts it off to length. All operations are entirely automatic and absolutely without waste or manual handling. The output is as high as three spokes a minute.

It will be noted that the coil of wire is supported on a reel resting on the floor at the extreme left, from which it unwinds as it is drawn through the straightener on its way to the swaging machine. This straightener is an improved design of the rotary type made by this company. It has offset steel eyelets mounted with ball bearings in suitable holders, so that the former do not bear in an unyielding manner against the passing wire, but revolve so as to prevent marring the finish.

The wire enters the swaging machine through the rear end of a hollow spindle carrying the dies, and as it is drawn through these swaging dies these close automatically over the wire, after allowing that portion forming the butt to pass out of them, and impart a large number of sharp, clean blows simultaneously in couples from diametrically opposite directions on the stock, reducing it rapidly and giving it a sort of hammer temper for the distance between the butts. When the dies open again the portion of the wire forming the opposite butt passes out of the machine unswaged.

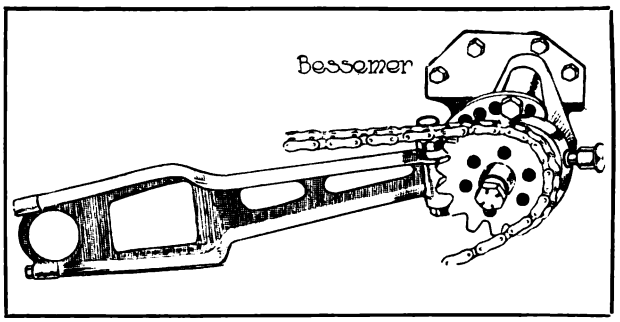
The outward travel of a saddle with a chuck mounted on a horizontal slide in front of the machine head draws the wire through. This saddle is provided on its rear with a rack, seen projecting at the end of the slide in the illustration, in which meshes an oscillating segment gear, already set in motion by a face cam and roller underneath the bed of the machine. The connection between the segment and the cam roller lever is obtained by means of a special form of link having a right and left hand nut, readily reached and locked from the rear. When this is adjusted vertically it varies the centres of the link pins, increasing and decreasing the arc of travel of the segment gear, correspondingly varying the travel of the saddle on the horizontal slide above the bed and producing thereby spokes of different overall lengths and with different swaged portions between the butts.

The wire gripping chuck, carried by the saddle, closes on the wire for the outward or drawing stroke and releases it at the end of the stroke, being entirely clear during the return of the chuck to its starting position. The automatic operation of this member is obtained through the up or down action of a wedge actuated by the saddle as it reaches its extreme points of travel. At the end of the outward stroke the wire is gripped firmly in the cutting off attachment, while the saddle returns to take the next stroke forward, and the finished swaged spoke is cut off just before the next drawing stroke begins. The cutting off attachment consists of two hardened

Swaging Machine for Automobile Wire Wheel Spokes.

and ground steel bushings, the cutting edges of which are in close contact and slide past each other at the proper time, leaving the ends of the spoke sharp and square with the wire.

Forced oil lubrication to all running parts and on the dies is maintained by an automatic oil feed pump. The net weight of the machine is about 5500 pounds, and the gross weight 6150. The floor space necessary is about three by six feet. Other types of wire feeds are available to suit different makes of spokes and the machine is built for either belt or motor drive.



Failure to co-operate with the Motor Dealers' Contest Association, New York City, is given as one of the reasons why the New York Motor Speedway Association, which intended to build a motordrome at Garden City, N. Y., is to withdraw from its offices on Automobile row and abandon its project.

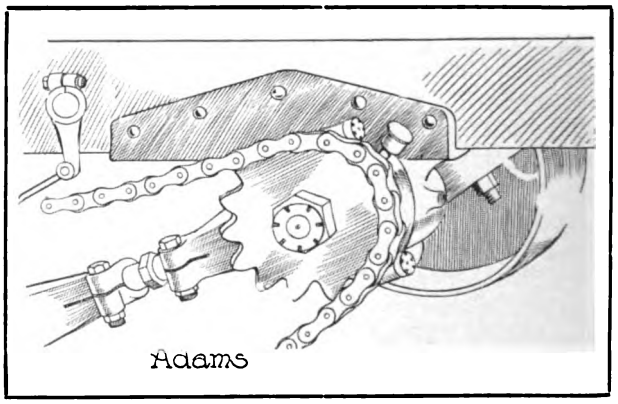
IN THE COMMERCIAL VEHICLE FIELD.

Changes in Radius Rod Design as Revealed by Some Manufacturers in Their Latest Product—Agricultural Competition in Canada and Other Truck News.

THOSE who have followed closely the changes in the design and construction of commercial motor vehicles, cannot help but appreciate

Vernier Adjustment on New Bessemer Chassis.

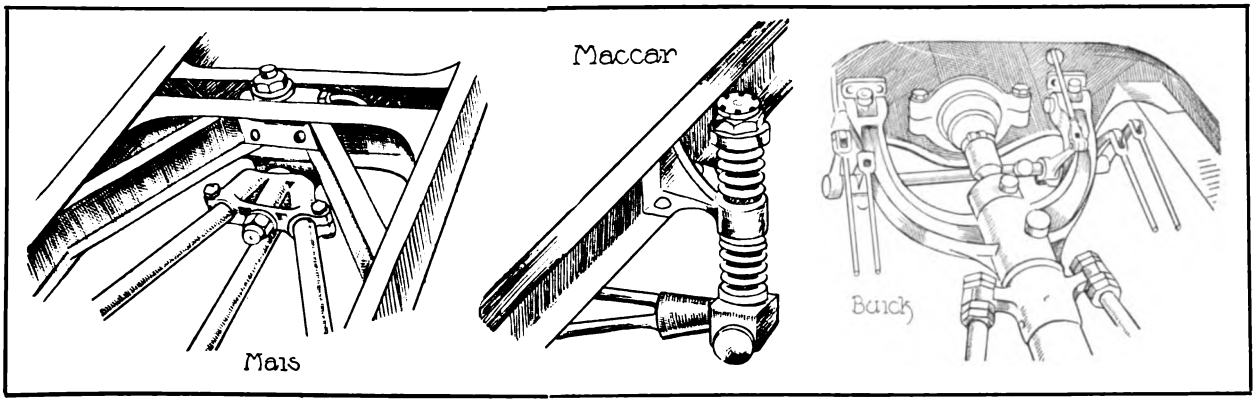


that one of the details that has been given very general attention is that of radius rods. There seemingly is an increased tendency to lessen the angle of inclination that there may be a more direct forward driving thrust. This is particularly noticeable with many of the shaft driven machines, and to some extent with those in which the drive is by side chains.

It is maintained that while the speed of the service vehicle may be comparatively slow and the springs of the machine so designed that there will be gradual deflection or reflection, there will be the vertical movement of the rear axle proportionate to the inequalities of the road surface. The tractive effort is assumedly the same and the angularity of the thrust is dependent upon the degree of movement. The longer the rod the less the degree of angularity and the upward thrust. Lengthening the radius rods and coupling them to the chassis frame members is held to cause the thrust to be directed more longitudinally, so that there is not the "lift" in the centre of the chassis frame that would cause extreme strain, especially when the load is, in a great part, back of the radius rod connection.

Some examples of new construction along this line are presented herewith. With the Mais the chassis frame is designed with two cross members well forward, between which is set a special block or fitting. The rear cross member is reinforced against the forward thrust by heavy channel diagonals from the centre to either side member. The thrust block carries a large socket, into which is fitted the globe of a short shaft, and on this shaft is mounted a yoke. In the ends of the yoke are sockets, into which are set the forward ends of the radius rods, clamping bolts affording means of adjustment when the relation of the rear axle has been determined. This yoke is pivoted on the shaft so that the movement of either end of the rear axle is not resisted, and the globe and socket connection permits the vertical action of the axle without stress. This joint is lubricated by two large grease cups connected with the block by heavy copper tube.

The Studebaker construction differs from this in that there is a heavy centre frame cross member, mounted in the channels of the side members and dropped to lower the long radius rod ends. The driving shaft is under this member and at either side of the shaft secured to the member are two large brackets. The radius rods are mounted in the lower part of these brackets and in the top of each is a small shaft with a long bearing to the ends of which are clamped two lever arms. The arms project downward. To the outside arms are attached the forward pull rods, and to the inside arms are secured the rear pull rods of the linkage of the two transmission brakes, this construction giving a direct draw of the rods in line with the shaft. The radius rods have a free motion with the vertical movement of the rear axle.



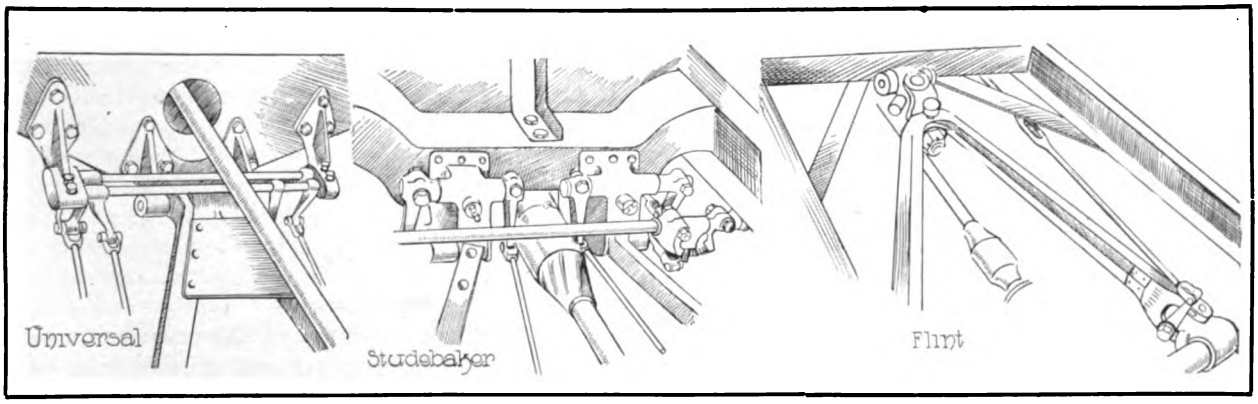
In the Universal worm driven one-ton vehicle the centre cross member is a wide web in which

Long Jackshaft Hanger of the Adams Machines.

is a round hole through which the shaft extends. Below the hole and under the shaft is a large bracket with two ears or lugs wide apart. The

Digitized by Google

Perfected Thrust Block Design in Mais, Forward End Arrangement on Maccarr and Enlarged Torque Tube Yoke on Buick Delivery Wagon.



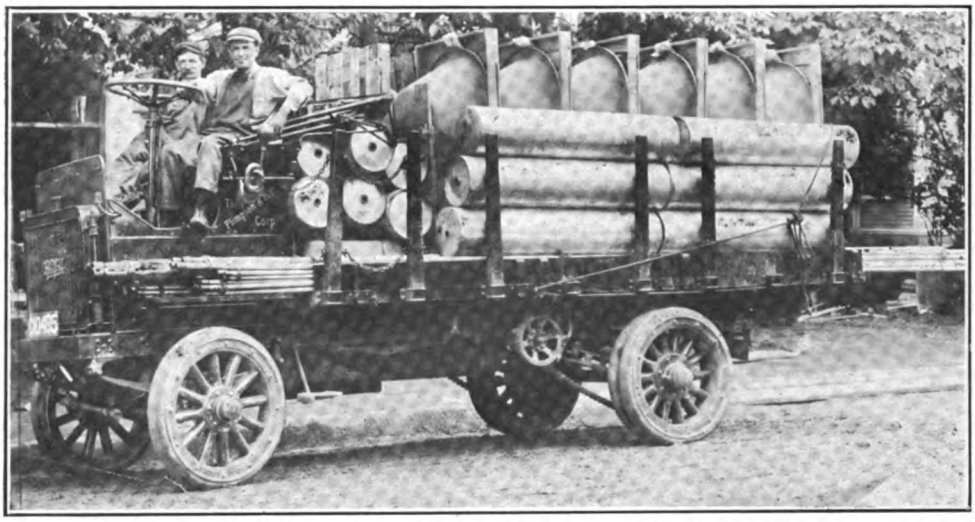
radius rods are of angle steel connected at the forward ends by a wide gusset plate, and ahead of this is mounted between the ends of the rods a fitting. A shaft extends through the lugs of the bracket and the fitting, on which the rods may move freely with the movement of the rear axle. At either side of the central bracket are two others, and in these are mounted the shafts for the service and emergency brakes.

The radius rods of the Flint wagon are steel channels with yokes at the rear ends, the forward ends being joined by a heavy curved member, through the centre of which is a yoked fitting, in which is a shackle that is mounted in a yoked bracket carried on the centre frame member. The coupling allows a transverse and vertical motion, and the rods may also twist on the supporting member, eliminating every probable stress. The yoked rear ends are connected with the rear axle so that a transverse movement is possible.

The Buick delivery wagons are built with the driving shaft enclosed in a torque tube that has a large, wide yoke with the ends carried in brackets on a large frame cross member, pivoted to allow a free vertical movement of the rear axle, and directly behind the yoke is a fitting in which the forward ends of the radius rods are secured after adjustment as to correct relation. The construction is not new, but it is extremely heavy and intended for endurance in service. Beneath the ends of the torque tube yoke are brackets that carry the brake shafts, with the forward pull rods extending through holes in the frame cross member.

The 1500-pound Maccarr chassis has a torque rod that has round upper and lower members to secure lightness. The forward end is shackled to a member mounted in a bracket on a frame cross member that is carried between helical springs. The rod moves at the rear end with the rear axle and is free to turn on the shackle at the forward end, and the possibility of vibration is taken by the helical springs and the thrust is very nearly direct at all times.

The Bessemer wagons have an adjustment for the forward ends of the radius rods in the jackshaft hanger in the form of an eccentric and a vernier arrangement of a segment of the eccentric, which may be secured in any desired grad-



Forward Ends of Worm Driven Universal, Coupling of 3.5-Ton Studebaker and "Triple-Acting" Design on Flint Machine.

Digitized by Google

uation by a bolt. This is independent of the adjustment that may be made at the axle end of the rod. Provision is made with the Adams machines to stiffen the chassis frames where the jackshaft hangers are installed by unusually long plates, the fittings extending backward from the hangers, and thus for these parts affording very secure anchorage.

SEEKING ECONOMICAL CITY DELIVERY.

ALTHOUGH it will be admitted that the cost of operation for one machine is relatively higher than with several and that the lack of facilities that would be possible or practical with the larger installation limits the productiveness that might be realized, it is of interest to learn that motor trucks are able to demonstrate their economy and efficiency in a satisfactory manner even under such conditions. This is exemplified in the experience of the Plimpton & Hills Corporation, Hartford, Conn., a wholesale dealer in plumbing and steam fitting supplies. In common with a large number of business houses this concern had no very definite information as to the expense entailed by its horse drawn equipment. A careful analysis of the situation revealed conditions which led the officials to believe that the figure was somewhat excessive and that there was every reason for estimating that it would increase rather than diminish. With this knowledge came the decision to purchase a three-ton truck, which was expected to do the work of at least five horses, and a Pope-Hartford, made by the Pope Manufacturing Company of that city, was selected.

Three-Ton Pope-Hartford Truck in Service with Plimpton & Hills Corporation, Hartford, Conn., as Loaded with Plumbing and Steam Fitting Supplies.

Inasmuch as the investment was regarded in the light of an experiment, the truck was placed in direct competition with the horses and was used for all kinds of transportation within the city limits. While the usual practise is to depreciate a vehicle of this character at the rate of 20 per cent. or some such matter, this car was accepted as a part of the equipment of the business and not as a separate item of expense. For this reason the plan adopted was to charge off 50 per cent. the first year and 50 per cent. of the previous year's valuation each subsequent year. The truck was placed in service in May, 1912, and the cost of operation for its first year, even with the increased charge for depreciation, figured out at $11.96 a day.

The average daily mileage has been 35. The intention has been to keep the machine on the road so far as this can be done, and during the year it has not been withdrawn for repairs. It is in charge of a man who has a factory training and thoroughly understands motor trucks. This driver and a helper handle the freight and in this manner the loading and unloading time is minimized so far as possible. Something like 20 tons are handled each day, and the concern has found that aside from the economy resulting from the use of the truck, the ability to make expeditious deliveries, especially with the prevailing rates for wages of plumbers and steam fitters, is of decided advantage. So satisfactory has the experiment proven that it is planned to add another motor vehicle some time this spring.

The White Company, Cleveland, O., has placed eight 34-passenger motor omnibuses with the Pittsburg Auto Transit Company, Pittsburg, Penn., for regular service in that city.

WINNIPEG MOTOR COMPETITION.

Annual Contest in Connection with Canadian Industrial Exhibition in July.

The committee in charge of the agricultural motor competition, to be held in connection with the Canadian industrial exhibition, Winnipeg, Manitoba, July 1-16, has issued entry blanks and a booklet setting forth the conditions of the tests. The events will be divided under two general heads, one for agricultural motors and the other for gang plows.

The former will be sub-divided into three divisions, the first for machines using gasoline engines, the second for kerosene engines and the third for steam tractors. These will be sub-divided again into classes, those for divisions one and two being as follows: A, with piston displacement of less than 300 cubic inches a minute; B, from 300 to 500; C, over 500. Division three will have the following classes: A, piston area in square feet times 60 or less; B, 60 to 100; C, over 100, the piston displacement to be the area times 700, which is established as the typical speed. The trials will include brake tests, plowing and such others as the judges deem essential.

The plowing competition will be divided into two classes, as follows: A, engine plow with six bottoms and under; B, over six bottoms. The test shall consist of one or more rounds of the plowing field, as may be deemed necessary by the judges. The contestants may use any kind of engine they wish, the depth of the plowing to be uniform and as directed by the judges. Each plow must cut full width. Evenness of depth of furrow, uniformity of thickness of furrow slice, straightness of furrow and finish at the ends will be taken into consideration in making the award.

Full information may be secured by addressing Prof. L. W. Chase, engineer in charge, Canadian Industrial Exhibition, Winnipeg.

ABANDON TRUCK SHOW.

Definite Action Taken with Reference to Holding Display in New York City.

The executive committee of the National Association of Automobile Manufacturers, after securing the sentiment of the Automobile Board of Trade and manufacturers generally throughout the country, at a recent meeting decided to discontinue the truck show in New York City, and consequently none will be held next year, many of those interviewed having stated that they have found such displays cost more than the returns warrant. It is understood, in view of this decision, that Madison Square Garden will be abandoned altogether and that next year the pleasure car exhibition will be held in the Grand Central Palace only.

It is expected that similar action will be taken in connection with the holding of a commercial vehicle display in Chicago. The proposition to abandon both of these displays was brought up at the meeting of the executive committee of the N. A. A. M. in March, and met with the approval of that body. Definite action was postponed until the matter could be laid before the manufacturers themselves.

MOTOR TRUCKS IN SERVICE.

A handsome motor hearse built by the Peerless Motor Car Company, Cleveland, O., and displayed at the Chicago truck show has been purchased by the Newberry Auto Livery Company, Chicago, for use in conjunction with its 21 Peerless touring cars for funerals.

The John Bell Company, a builders' supply firm of New York City, has placed an order for five Garford motor trucks of six tons capacity each, made by the Garford Company, Elyria, O. This firm bought a Garford machine about a year ago and the development of the Bronx borough, with its large building operations, has resulted in greatly increased business for the Bell company, which necessitated this enlarged equipment.

An Alco truck, owned by John Lucas & Co., Philadelphia, Penn., loaded with three tons of paint, was driven from Philadelphia to Pittsburg, a distance of about 400 miles, in five days recently. The night stops were made at Lancaster, Gettysburg, Bedford and Greensburg. This was the first overland delivery made between the two points in 25 years, when horses made the journey in several weeks.

A new portable type of complete wireless telegraph station has been exhibited recently to the government officials at Washington, D. C. The outfit, which includes two telescopic towers, is carried on a large automobile truck, and the two towers can be raised to an altitude of 200 feet by the same motor that propels the vehicle. The instruments and generating apparatus are located in one of the rooms into which the truck is divided. This room is also used by the operator in the sending and receiving of messages.

The New York Railways Company, the public service corporation that controls the street, elevated and subway transportation of the metropolis for Manhattan and the Bronx, has purchased of the General Vehicle Company 29 electric wagons and trucks, which will be used for differing work. Three of these will be 1000-pound wagons with panel bodies, one will be a money wagon on a 2000-pound chassis, five will be 4000-pound chassis fitted with bodies and equipment for emergency service, 14 will be 3.5-ton chassis and two five-ton chassis, all with standard make platform bodies.

Henry Frerk Sons of Chicago, dealer in building materials, coal and feed, has operated a four-ton KisselKar truck, made by the Kissel Motor Car Company, Hartford, Wis., during the past year. The vehicle replaced two double and one single-horse teams and the figures compiled are interesting. The truck was in service 263 days and covered 10,241 miles, an average of 39 miles a day. The average weight carried a load was 7225 pounds. One gallon of gasoline was used for each 28 miles and the tire expense a mile was five cents. The firm finds the machine of particular value in taking care of distant deliveries quickly, thus materially widening its field of service.

MOTORING LAWS AND THEIR ENFORCEMENT.

Rhode Island Legislature Adjourns without Passing Truck Bill---New York City Aldermen Asked to Tax Commercial Vehicles Heavily---Other Legal News.

MOTOR truck users in Rhode Island were successful in their efforts to defeat the proposed bill imposing a registration fee of $20 on business vehicles of one ton capacity and $10 for each additional ton, at least for the time being. When the matter came up in the lower house of the legislature it was recommitted, and when the legislature was adjourned it was still in the committee. This should not be taken as an indication that the matter has been decided definitely, as it is anticipated that some energetic work will be necessary in order to prevent the reappearance of the bill next year.

In the meantime, Borough President McAneny of Manhattan has introduced in the board of aldermen of New York City, a proposed ordinance which would deal the motor truck industry the most serious blow yet, if it were to become a law. The Motor Truck Club, the Automobile Dealers' Association and other organizations in that city have taken active means to protest against its passage. The text of the measure follows:

Section 1—No vehicle shall be allowed to use or pass over the pavements of any street of the City of New York after the passage of this ordinance without a license from the bureau of licenses of said city; and the bureau of licenses of the City of New York is hereby authorized and directed to regulate the widths of tires, loads per wheel, and widths of vehicles using or passing over the pavements of the City of New York, and to issue licenses or permits, to charge and collect fees, in addition to any other fees elsewhere authorized, to employ such clerks and inspectors as may be provided for by the board of aldermen and the board of estimate and apportionment, and to provide weighing stations as hereinafter set forth.

Section 2—Annual licenses shall be granted upon payment of the fees specified in the following schedule, to wit:

(a) Vehicles carrying or intending to carry a total gross load of 6000 pounds, or less, upon any wheel, shall be charged the following annual license fees:

Loads in pounds per inch width of tire	License fee for each vehicle
750 or less	$1
More than 750 but not to exceed 800	3
More than 800 but not to exceed 850	6
More than 850 but not to exceed 900	12
More than 900 but not to exceed 950	25
More than 950 but not to exceed 1000 (maximum)	50

(b) In addition to the fees provided in sub-division a, further fees shall be charged for loads greater than 6000 pounds, but not exceeding 10,000 pounds upon any wheel as follows:

Weights in pounds per wheel	License fee for each vehicle
More than 6000 but not to exceed 6500	$75
More than 6500 but not to exceed 7000	110
More than 7000 but not to exceed 7500	150
More than 7500 but not to exceed 8000	200
More than 8000 but not to exceed 8500	300
More than 8500 but not to exceed 9000	500
More than 9000 but not to exceed 9500	750
More than 9500 but not to exceed 10,000	1000

For loads greater than 10,000 pounds per wheel, license fees shall be charged for each vehicle at the additional rate of $500 for each 1000 pounds increase in weight, or portion thereof, per wheel; provided, however, that no load greater than 1000 pounds per inch width of wheel shall in any case be permitted, except as specified in sub-division d.

(c) Vehicles six feet six inches or more in width over all shall be charged, in addition to the fees specified in sub-divisions a and b, the following annual fees:

Width of vehicles	License fee for each inch in width in excess of 6 ft 6 in.
More than 6 feet 6 inches but not to exceed 7 feet 0 inches	$5
More than 7 feet 0 inches but not to exceed 7 feet 6 inches	10
More than 7 feet 6 inches but not to exceed 8 feet 0 inches	15
More than 8 feet 0 inches but not to exceed 8 feet 6 inches	20
More than 8 feet 6 inches but not to exceed 9 feet 6 inches	25

In determining this fee, any width which is greater than six feet six inches by a fraction of an inch, or by a distance which contains a fraction of an inch, shall be reckoned as if it were the next greater even inch.

(d) No loads, rigging, harness or other appurtenance shall in any case be allowed to extend beyond the outside limits of any vehicle except as specified in sub-division c.

(e) In lieu of the fees hereinabove provided for in sub-divisions a and b for loads of 6000 pounds or more on any wheel, special permits may be issued for single trips and fees charged therefor, at the rate of 10 per cent. of the fees therein provided, except that no such single fee shall be less than $25; and in lieu of the fees provided in sub-division c for excess width of vehicles, special permits for single trips may be granted upon payment of a single fee of not less than $10.

Section 3—Duplicate plates stating the weight of empty vehicle, the maximum load capacity per inch width of tire and per most heavily loaded wheel and width over all vehicle, shall be furnished by the city upon payment of the license fees herein established, and shall be permanently attached in a conspicuous place on each side of the vehicle as directed by the chief of the bureau of licenses.

Section 4—Suitable weighing stations shall be established in various parts of the city in such numbers and at such places as may be determined by the board of estimate and apportionment upon the recommendation of the chief of the bureau of licenses. All vehicles shall be weighed at one of such weighing stations whenever required by a duly authorized representative of the bureau of licenses.

Section 5—Any violation of the provisions or regulations of this ordinance shall render the owner of such vehicle liable to a revocation of its license, if any be held, and such owner shall be deemed guilty of a misdemeanor, and may upon conviction thereof be fined not less than $100 nor more than $500, and in default of payment of such fine may be committed to prison for a term not to exceed ten (10) days.

Section 6—All ordinances, resolutions, permits or licenses heretofore adopted, issued or granted by the City of New York, or by any board, body, council or officer thereof, or by any department, division or bureau thereof, permitting, licensing or regulating the widths of tires, loads per wheel and widths of vehicles using the pavements of the City of New York, are hereby in all respects repealed, cancelled and revoked.

Section 7—This ordinance shall take effect ninety (90) days after the date of its approval by the mayor.

GIVES GOOD ADVICE.

Automobile Legal Association Urges Motorists to Obey Law's Provisions.

The Automobile Legal Association, with headquarters in Boston, calls attention to the fact that motorists in that state are violating the provisions of the law with reference to illuminating the rear registry number, suggesting that the practise of carrying tires at the rear doubtless is responsible for the error. Additional advice is given under the heading, "Stop and make yourself known," as follows:

The law requires that a person who causes injury to another or damage to property must not knowingly go away without stopping and making himself known, and the Massachusetts highway commission in a recent case have held that simply to stop and give people an opportunity to secure your number is not compliance with the law. The law undoubtedly requires that a person must not only stop, but must give his name and address in order to make himself known.

A number of motorists have, during the past year, been so unfortunate as to kill dogs, and because they failed to stop and make themselves known, have been liable to criminal prosecution, and rather than take the chance of a conviction they have paid various sums as damages for killing the dog, which they would not have been obliged to pay had they stopped and made themselves known as required by law. A person cannot be held liable for killing a dog unless he is operating his machine recklessly or in a grossly negligent manner, or unless he kills the dog wilfully or intentionally.

TO THE SUPREME COURT.

American Automobile Association to Test Constitutionality of Registration Laws.

A committee consisting of William H. Hotchkiss of New York, Lewis R. Speare of Massachusetts and H. M. Rowe of Maryland, has been appointed by the American Automobile Association to consider the advisability of taking the matter of registration fees for automobiles to the United States supreme court, in an effort to determine the constitutionality of the proposition. The matter was discussed fully at the meeting of the directors of the association in Baltimore, Md., May 8. The official statement of the situation contains the following:

While there has been an acquiescence for several years on the part of motorists in accepting the automobile registration tax when the money was employed in highways progress of one kind or another, especially in those states where it was paid in lieu of a personal property tax, the legislatures of the past winter have shown such a marked inclination to increase fees to an exhorbitant degree that the A. A. A. officers have taken up the matter with the state divisions of the national body, with the result that President Laurens Enos appointed a special committee to prepare and present a report.

Where the registration tax has been in lieu of all other taxes, and the money used exclusively for road maintenance, as in New York State, there has been slight objection on the part of the motorists over the unconstitutional discrimination against one class of road user, as long as the amounts paid were within reason. The protest recently has accumulated strength in those states in which the owners of motor driven vehicles are called upon to pay a registration tax, personal property tax and still another tax for the driving of the car. Double taxation and discrimination against one class of road user are the two points which invite attack on the ground of unconstitutionality.

The case that may be carried up originated in New Jersey, which state calls for three payments by the automobile owner—registration of car, driving license and property tax. The A. A. A. state organization instituted the suit, which has had adverse decisions in New Jersey courts.

LAW IS UNCONSTITUTIONAL.

State Has Collected from Motorists Nearly $600,000 Which Cannot Be Expended.

According to Homer J. Tice, chairman of the good roads committee of the house of representatives in Illinois, the automobile license law, under which nearly $600,000 has been collected by the state, was passed unconstitutionally. The fund is now in the state treasury and it is claimed that it cannot be expended without special appropriation.

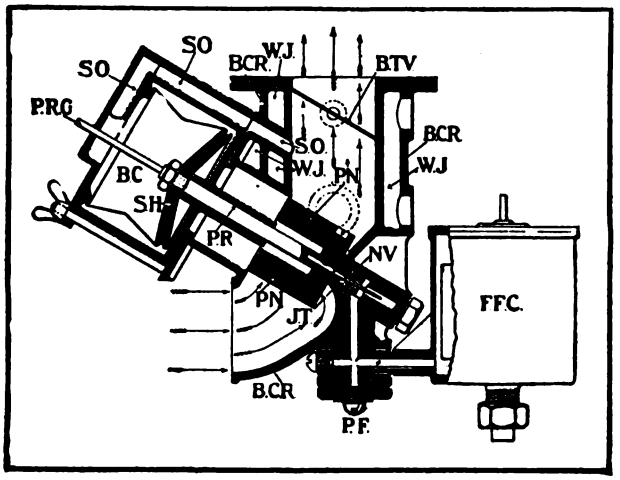
Representative Tice has introduced a new bill, carrying all of the old law and providing in addition for the distribution of the $600,000 to the respective counties for state aid roads. It is understood that in spite of the unconstitutionality of the law the money paid cannot be recovered unless a protest was filed at the time it was paid.

LEGISLATIVE BRIEFS.

Mayor Gaynor of New York City has introduced an ordinance in the board of aldermen reducing the present taxicab rates, and doing away with the hack stand privileges in front of hotels, clubs, etc.

Under the terms of the new motoring law in South Dakota, owners will be obliged to pay a license fee of $3 for each machine from July 1 to Jan. 1, 1914, and $6 a year thereafter. The present fee is $1. It is expected that $100,000 will be raised annually for good roads under the new plan.

In a trial of a chauffeur accused of leaving his motor car for 38 minutes on Boylston street, Boston, in violation of the traffic ordinance, counsel contended that the car was not left as a person was seated in it during the period named. The court found the defendant guilty, although admitting that the point was a novel one, and the case has been appealed to the superior court.



New legislation in New Jersey provides as follows: That no license to a driver shall be granted to any person under 18 except by the commissioner of motor vehicles in person and then only to those between 16 and 18; that the commissioner may suspend any license granted under his authority; that for registration purposes the horsepower formula shall be adopted yearly by the commissioner under the restriction that he shall adopt no formula not used by standard trade associations; that the commissioner shall have power to summon witnesses to attend hearings in revocation proceedings and carrying a fine of $100, and that the commissioner is vested with the powers of a justice of the peace, recorder or police judge.

THE REPAIR SHOP AND GARAGE.

Construction and Operation of S. U., an English Carburetor, Made in This Country --Priming Valve for Starting Motor on Mixture of Kerosene and Gasoline.

FITTING and adjusting a carburetor to an old motor frequently involves considerable labor and patience, as it is often difficult to set it so that a uniform mixture is obtained at high and low speeds. Economy of fuel is an important factor and an owner when solicitating the advice of the repairman desires to know how many miles to the gallon the proposed vaporizer will give, as well as its efficiency. These desirable features and others are incorporated in the design of the S. U., an English carburetor, which is manufac-

S. U. Carburetor, Having but One Moving Part and Being Easily Adjusted—The Principle Is That of a Constant Speed of Air Past the Jet and Accurate Fuel Adjustment.

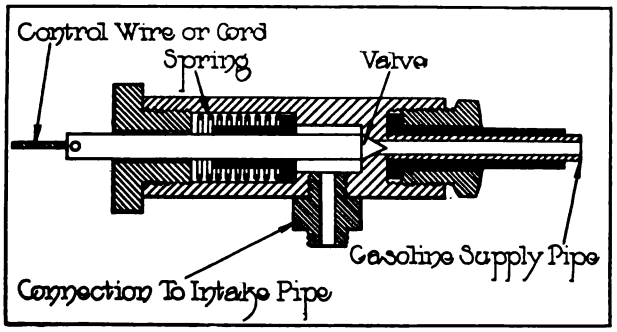
tured in this country by the Simms Magneto Company, for which George Sumner, Inc., 1926 Broadway, New York City, is selling agent.

That the carburetor differs from those of conventional design will be noted by the sectional diagram presented herewith. It will be seen that there is but one moving part, the piston, and this member does not actually touch the walls of the device, nor does the needle come in contact with the sides of the jet. Wear is, therefore, eliminated as well as springs, etc.

The float chamber F F C is of the conventional design, but the jet J T is set at an angle of 45 degrees in the choked or restricted portions of the jet chamber, through which the entrance of air is blocked by the interpositon of the concentric piston P N. The latter slides up and down in its cylinder, guided by a piston rod P R, which carries at its upper end a mushroom suction disc, forming the bottom of a bellows suction chamber B C. The piston rod continues in the shape of an indicator rod P R G, which passes through the cover of the suction chamber B C.

The lower end of the piston rod carries a tapered needle valve penetrating the centre of the gasoline jet J T. A tubular connection S O is formed between the upper portion of the jet chamber below the butterfly throttle valve B T V and the interior of the chamber B C. The balance of the components of the carburetor are: B C R, body of carburetor; N V, gasoline needle valve; P F, fuel supply; P N, piston governing the area of air passage across jet and carrying tapered needle entering jet, controlling delivery of gasoline thereof; S H, mushroom shaped suction head; W J, hot water or exhaust jacket spaces.

The operation of the S. U. is as follows: When the motor is operating slowly and without load, the piston P N obstructs the air passage to within .03125 inch, the total area then offered to the passage of air being approximately one-twentieth of a square inch. This extremely small area endows the air passing through it with sufficient velocity to thoroughly atomize the amount of fuel then being delivered through the jet.



As the throttle is opened the suction increases, the depression in the jet chamber above the jet increases correspondingly, and the suction effect then exerted obtains similarly in the suction chamber B C above the disc S H. This has the effect of lifting the under face of the piston farther away from the jet, augmenting the area of the air passage. At the same time the tapered needle valve N V is drawn further up the jet, the orifice therein is enlarged, and a proportionately larger volume of fuel is emitted. When at the top of its upward stroke the piston leaves so large an area for the air travel that a minimum of back pressure is exerted on the engine.

All the air passes by the jet at right angles to it, and as the supply of gasoline is entirely dependent on the form of the needle valve, it is a simple matter to increase or diminish the size of this member at any particular point when the speed at which the motor may be running is not entirely satisfactory. The accessibility is notice-

Digitized by Google

able, the unscrewing of the thumb screws permitting easy access to the parts.

The air space in the S. U. is automatically in-

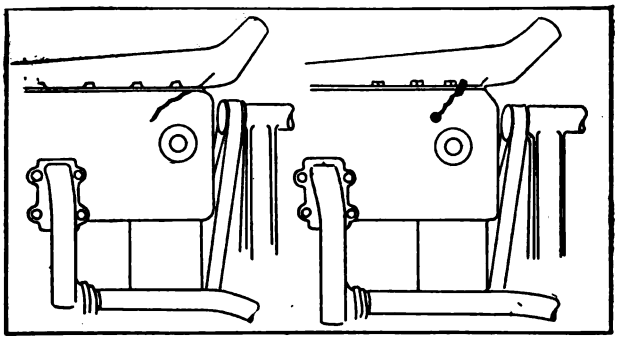
An English Invention for Starting Motor Utilizing Kerosene and Gasoline.

creased or decreased in accordance with the requirements of the engine, by the piston acting as a shutter, and rising and falling as the motor speed varies. At very low speeds the piston is shut down, but the draught is sufficient to properly spray the fuel, and at high the piston rises to its full extent, providing a large space for the air to pass. The speed of the air past the jet is therefore constant. The S. U. presents an advantage in fitting in that the float chamber can be placed in any convenient position as it revolves around the carburetor. Easy adjustment, economy of fuel, flexibility and power are features emphasized with the S. U.

MOTOR STARTING DEVICES.

That kerosene can be utilized for fuel is conceded by those who have experimented with it, but the chief objection is the difficulty encountered in starting when the motor is cold. There is no doubt that there will be considerable experimentation with the heavy fuel during warm weather, when it is more easily vaporized, than at present.

The invention of M. de Jarny, which is utilized by an English taxicab company, is of interest in that it is designed to overcome starting troubles attendant upon the use of kerosene, mixed with gasoline. As will be noted by an accompanying illustration, it is a valve device by means of which gasoline is fed to the intake pipe to obtain the initial explosions.



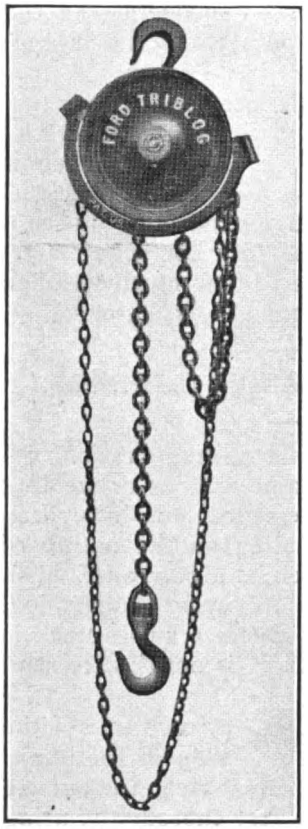
The valve is screwed into the intake manifold, which is drilled and threaded, and the source of supply of gasoline is a small container located on the dash or in any other convenient place. A valve is fitted and is normally held closed by a spring, but it may be opened when desired by a cord or wire. The latter is led to the front of the car near the starting handle, and when the driver wishes to start the motor the control cord is pulled, releasing the valve and allowing a small amount of gasoline to flow into the manifold. This insures the preliminary explosions, after which the motor is supposed to operate on the combination mixture supplied by the regular tank.

Details are not given concerning the dimensions of the openings into the manifold or the amount of gasoline utilized. The design is similar to several priming devices made in this country for starting the motor on gasoline in cold weather. Presumably the operator acquires by experience the knowledge of how much gasoline to use to secure the preliminary explosions.

REPAIRING CRACKED CYLINDERS.

The usual practise in repairing cracked cylinders is to employ the autogeneous or welding process, although iron cements, etc., have been used with success, depending on the nature of the fracture. The Commercial Motor, an English publication, prints the following suggestion, which may be of service where a small crack is to be mended and when there is not time to send the part to be welded:

Drill and tap a small hole at each end of the crack to prevent further extension of the weakness, and fit an iron stud. Next clean the outside and inside of the fracture very thoroughly, using a scraper and gasoline. File up some soft copper and fill the crack, heaping the filings over it. Then take a powerful blow lamp or a torch and direct the flame on the copper. By this method a fair amount of metal can be worked into the opening.



Method of Repairing Crack in Cylinder by Fusing Copper Filings.

After cooling, the studs are cut off flush and the copper filed smooth. It is said that the repair will endure indefinitely.

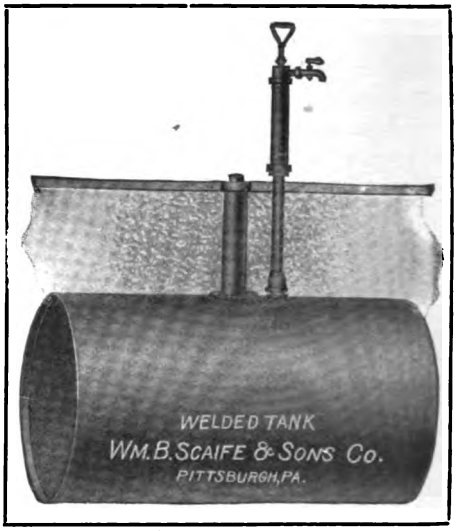
GARAGE AND REPAIR SHOP EQUIPMENT.

THE use of en bloc motors and the increasing number of commercial vehicles call for suitable equipment for handling this heavy work, and among the devices marketed is the Ford Tribloc, made by the Ford Chain Block & Manufacturing Company, 139 West Oxford street, Philadelphia. As will be noted by the accompanying illustration, it is a spur gear chain block of the hand hoist type, and one of its features is a patented loop hand chain guide, which prevents the hand chain from over riding the hand wheel when operating the hoist at any speed or in any direction.

Ford Tribloc.

In the Tribloc the load is held by a device entirely independent of the lifting mechanism. The maker points out that all of the applied power is the hoisting effort and that 80 per cent. of that applied to the hand chain is converted into lifting energy. The latter is so multiplied that one man pulling 82 pounds can lift a ton four feet a minute.

The parts are few and simple and the gears centre around the one main bearing. The gears are of steel covered by a dust proof steel case and are balanced. All working parts are of steel and the swivel hook is a steel forging. The Tribloc is made in sizes ranging from .25 ton to 40 and is guaranteed for five years. The patented loop guide can be furnished on all sizes and is interchangeable with the strap hand chain guide. The company also manufactures differential and screw gear hoists. Figures and data will be forwarded upon request.



GASOLINE STORAGE OUTFITS.

The storage and handling of gasoline are becoming items of importance in these days of constantly increasing cost of fuel, and garages and service stations are giving the subject more attention than formerly. Not only must the system make for convenience, but it must provide accurate means for noting the amount utilized as well as prevent loss by evaporation or careless handling.

The William B. Scaife & Sons Company, Pittsburg, Penn., manufactures a wide variety of gasoline, oil and fluid storage systems, one of which is shown in an accompanying illustration. They are made in various sizes ranging from 60 gallons to 1000 and come complete for installation.

The tanks are constructed of a high grade open hearth steel and are free from rivets, etc., being welded by the autogenous process. They are thoroughly galvanized inside and out by a hot process and pure zinc is utilized. A coat of rust proof paint is applied to the exterior and each tank is tested with compressed air to insure absolute tightness.

The filler pipe is sturdily constructed and a galvanized malleable iron rim cap is grooved on the inside to fit tightly over two strong lugs on the filler pipe casting. A bronze padlock prevents tampering. The cap requires no tool to operate, a quarter of a turn with the hand releasing it after it is unlocked. Several lug slots are provided through which the air enters by suction while the contents of the tank are being pumped. A perforated brass strainer sets inside the pipe, easily removed for cleaning, and there is also a screen covering the vent space. When the filler pipe is installed under a driveway or sidewalk a cast iron box with hinged cover is provided at a slight additional cost.

One of Several Gasoline Outfits Made by William B. Scaife & Sons Company.

The long distance pump is of the suction type

Digitized by Google

and it is stated that it is very powerful and easily operated. The base is provided with an opening to admit the suction pipe in case it is not desirable to cut a hole in the floor and have the supply pipe enter at the bottom. Either bolts or screws may be employed for securing it. The faucet is of the anti-drip type and has improved shut-off features. Provision is made for holding a can, etc. A bronze padlock is securely riveted to the top cylinder casting, and swings aside out of the way when the pump is operated. The foot valve is located in the lower cylinder casting and contains a ground bevel seat. The pump faucet, cylinder and inside parts are brass, the handle, top and bottom castings of malleable iron galvanized and the base is cast iron black enameled. The maker will forward particulars, including price list, upon application.

HILL-STAGE TUBE VULCANIZER.

A revolving, quick steaming vulcanizer, said to permit the operator handling eight tubes at one time and without changing his position, has been brought out by the Hill-Stage Company of Anderson, Ind. The boiler is of porcupine construction where the flame strikes it, making for rapid and uniform heating. The vulcanizer can be operated with a gasoline burner or with direct steam. Details will be supplied on request.

FORMULAE AND USEFUL MECHANICAL TABLES.

Alloys for Metal Patterns.

An alloy suitable for small metal patterns is composed of tin one part and lead one part by weight. The result is a somewhat soft alloy which requires care in the handling of the patterns. Some harder mixtures are as follows:

Lead	Antimony	Tin
55.0	30.0	15.0
55.0	22.7	22.3
61.3	18.5	20.7

A white metal that has small shrinkage and is good for pattern plates is lead 90, antimony 10. A harder metal with small shrinkages and very good for pattern plates is zinc 66 per cent., tin 34 per cent. An amalgam, very convenient for stopping up holes that cannot be soldered easily, is made from the filings of the last named alloy, and mercury kneaded in the hand into stiff dough, squeezing out all the mercury possible. This amalgam should be pressed when first made, into the cavity and allowed to harden. When hard it may be filed or scraped like the metal itself.

Melting Points of Alloys.

The following table gives the melting points of alloys of tin, lead and bismuth:

Tin	Lead	Bismuth	Degrees Fahrenheit	Tin	Lead	Bismuth	Degrees Fahrenheit
2	3	5	199	4	1	—	372
1	1	4	201	5	1	—	381
3	2	5	212	2	1	—	385
4	1	5	246	3	—	1	392
1	—	1	286	1	1	—	466
2	—	1	334	1	3	—	552
3	1	—	367				

Gears for Screw Cutting.

Take from the index the number of threads cut by equal gears and multiply it by a number that will give for a product a gear on the index. Place this gear on the spindle or stud. Then multiply the number of threads an inch to be cut by the same number, and put the resulting gear on the screw. For example: The lathe cuts four threads by equal gears, and 13 threads an inch are wanted. then

$$\frac{\text{spindle or stud}}{\text{threads to be cut}} = \frac{4}{13}$$

The constant 5 will give for a product a gear on the index, and

$$\frac{4\times5}{13\times5} = \frac{20}{65}$$

Therefore, to cut 13 threads an inch, would require a gear of 20 teeth on the spindle or stud, and a gear of 65 teeth on the lead screw.

Care of Grinding Wheels.

When a grinding wheel becomes glazed or smooth it is necessary to redress the surface or it will continue to grow smoother, lose its cutting ability, heat the work and cause chatter. Glazing is caused by two factors—too high speed or too hard bond. After the wheel has been dressed by passing a diamond point across its face its speed should be reduced in an effort to prevent further glazing. If this does not do it, increase the speed of the work.

U. S. Standard Screw Threads.

Diameter of Screw at Top of Thread.	Threads per Inch.	Diameter at Root of Thread.	Width of Flat, Top and Bottom.
1-4	20	.185	.0063
5-16	18	.2403	.0069
3-8	16	.2936	.0078

AVIATION IN AMERICA AND ABROAD.

Details of the Latest Burgess Folding Flying Boat---Official Stability Test of Dunne Biplane---Prevost Secures Hydraeroplane Trophy---New Records.

BECAUSE Burgess Co. & Curtis, Marblehead, Mass., has departed somewhat from recognized American standards in manufacturing machines for the United States government, and particularly for the navy, the productions of this concern are of particular interest. Three distinct designs have been prepared by W. Starling Burgess to conform with the special requirements for which they were purchased. The latest of these is now undergoing trials at Marblehead. This is known as model K or the Burgess flying boat, and is presented in an accompanying illustration.

The hull, power plant and main surfaces each form separate units capable of being assembled and taken down in the least possible time. The fabric, making it very strong and serviceable.

The construction of the wings is particularly interesting. While the lower plane includes in its frame work both front and rear longitudinal members, the upper surface is constructed with a single heavy steel tube throughout its length, the ribs being so connected to this tube as to permit of warping without straining them. The motor is an eight-cylinder, 70 horsepower, air-cooled Renault, and the propeller is of 9.5 feet diameter, being mounted directly on an extension of the camshaft and thereby reducing the 1800 revolutions a minute of the engine to 900 revolutions. The weight of the motor is 400 pounds, its bore approximately 3.75 inches and its stroke 4.75. Ignition is by the latest type of Bosch magneto.

Burgess Flying Boat, Model K, Built for United States Navy by Burgess Co. & Curtis, Now Undergoing Its Trials at Marblehead, Mass.

principal innovations in the design include: The triangular arrangement of wing struts, allowing the upper plane to be staggered forward of the lower plane in order to increase the carrying efficiency; the upper and lower wing surfaces permanently attached to each other and capable of folding together; the peculiarly shaped hull and the detachable unit power section.

The aviator and passenger are carried near the bow of the boat, their seats being arranged in tandem. At the canoe shaped stern are located the elevator and the combination rudder for steering both in the air and on the water. The hull is built up on spruce and oak ribs, double diagonally planked with mahogany separated by

The principal dimensions are: Spread of upper main plane, 43 feet; lower main plane, 36 feet; depth of wings, five feet six inches; area of supporting surface, 397 square feet; length over all, 31 feet; length of hull, 29 feet six inches; height, eight feet 10 inches.

DUNNE BIPLANE STABILITY.

The Royal Aero Club of Great Britain has issued a certificate of the performance of a Dunne biplane entered for a test of natural stability at Salisbury Plain, England, last December. Two official flights were made on succeeding days, the official observer being a passenger. The first

Digitized by Google

was made with the wind blowing in gusts up to 20 miles an hour, and the second under similar conditions. In the former the pilot ceased to manipulate all controls for a period of 1:05 while flying over a spot where irregular disturbances were, from the actual experience of the observer, known to prevail, and only resumed their operation upon the request of the observer. In the latter test the machine described a complete circle without the slightest guidance on the part of the operator after he had adjusted the controls for the circuit.

Lieut. Dunne, the designer and constructor, is an officer in the British army. He has been interested in aviation since 1908, and is said to have made a flight in that year. He first came into public notice with a monoplane, in which the remarkable stability was apparent from unofficial tests. He appears to have changed his design but slightly in adding the second surface. Additional interest in the machine will be awakened by the recent announcement of the results of the December tests.

Briefly described, the main plane formation of the Dunne biplane is in the form of a V, the point of the V being the advancing edge, so to speak. There is no tail and the nacelle or body is suspended between the upper and lower main planes, extending backward from the point of the V a distance of 18 feet. On either side of this and back of the supporting surfaces are two seven-foot propellers driven by gears from the engine within the hull.

The principal feature is held to be the shape of the main planes, which have considerable camber close up to the centre, this being diminished toward the tips, while at the same time the leading edge is lowered, until at the outer extremities, the planes present an actual negative angle of incidence. The entire control is said to be exercised by the ailerons set out at the rear ends of the planes, that at the right being guided by a lever at the pilot's right, and that at the left by a lever on that side. These can be moved independently of each other or together at the will of the operator.

Maurice Prevost won the first international race for Schneider cup at Monte Carlo, Monaco, April 16, using a Deperdussin machine. The trophy was presented recently by Jacques Schneider of France as an annual international award for hydraeroplanes, similar to the Gordon-Bennett cup for aeroplanes. The other competitors in this year's event were: Roland Garros, Morane-Saulnier; Espanet, Nieuport, and Charles T. Weymann, Nieuport. The last named represented America, while the others composed the French team.

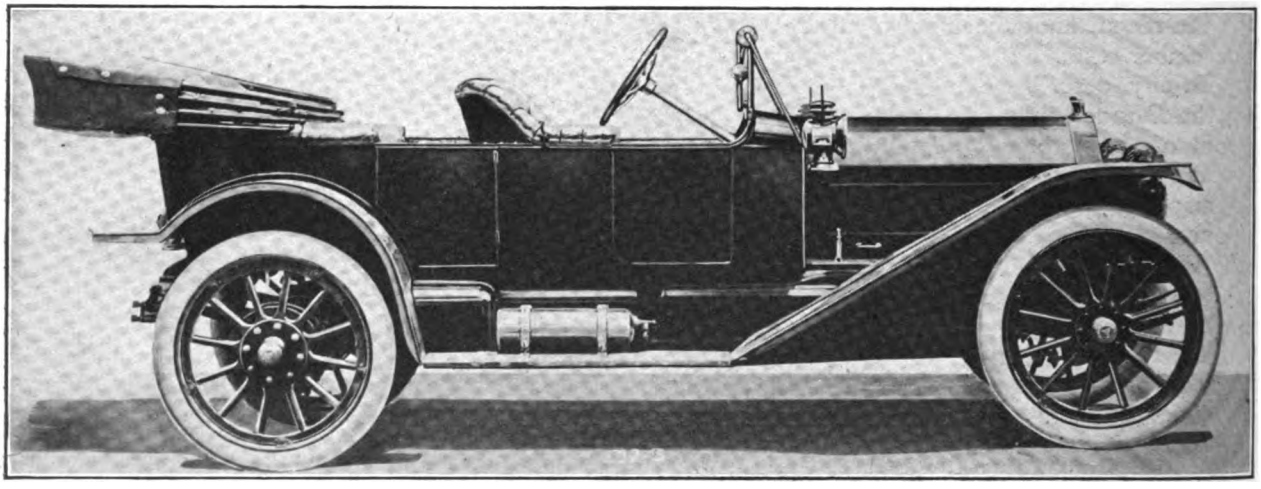
A new world's duration record for pilot and four passengers was created at Orleans, France, April 16, by Champel in a Champel biplane fitted with a 10-cylinder Anzani motor, the new mark being 3:01:00. A new distance record was made at the same time, this being 155 miles.

New world's altitude records were made by Marty with a Caudron biplane at Crotoy, France, April 16, when he reached 8658 feet with three passengers and 4757 feet with four passengers. The previous marks were held by Henri Farman biplanes, the former at 4409 feet, made by Chevillard, and the latter at 3675, made by Gougenheim.

Eight hydraeroplanes have been nominated to participate in the international Great Lakes flying boat cruise, which is scheduled to start from Chicago, July 8, and end in Detroit a few days later. The makes of machines have not been made public as yet, but some of the aviators who will pilot them are: Thomas Benoist, Hugh Robinson, Anthony Janus, Frank Harriman, C. C. Witmer, Weldon B. Cooke, Max Lillie and F. B. R. Verplank.

The Bosch Magneto Company, New York City, announces that the Rumpler monoplane, utilized by Lieut. Canter in making new world's records in Germany recently, was equipped with a 90 horsepower Mercedes-Daimler motor, using Bosch magneto and plugs.

An interesting cross country flight is reported from Orleans, France, in which Champel, using a biplane designed and constructed by himself, flew from Juvisy to Orleans, a distance of practically 62 miles, with three passengers in 44:00.



The German navy officials are said to have perfected plans for the expenditure of $12,500,000 for aeroplanes and dirigibles during the next five years. This sum is in addition to the amount set apart for the army, which is said to reach $250,000,000. A bill appropriating $750,000 as the initial outlay in connection with the naval plans has been introduced in the imperial parliament.

Glenn H. Curtiss has renewed his offer to instruct free of charge as many men as the United States government cares to assign for signal corps duty at his military aviation camp in California or at Hammondsport, N. Y.

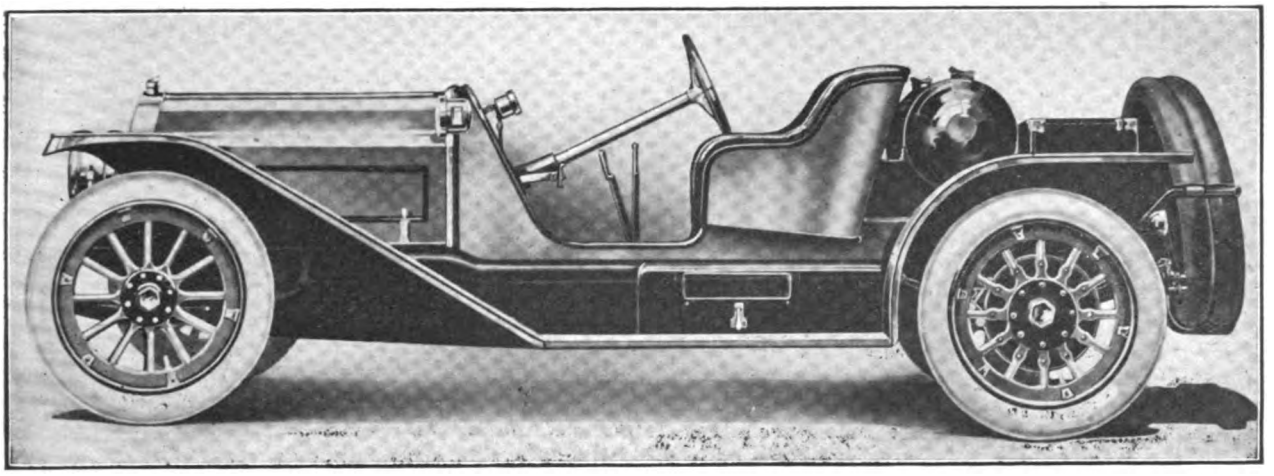
HAVERS LINE INCLUDES NEW SIX CHASSIS.

CHANGES in the models produced by the Havers Motor Car Company, Port Huron, Mich., for the present season consist of refinements in the details of the series C, Havers Six 44, and the addition to the line of a series D, a six-cylinder chassis to which is fitted a five-passenger touring type of body and a speedster design. The Six 44 will be equipped with three styles of bodies, four and five-passenger touring and two-passenger roadster. The general specifications of the new chassis are similar to those of the series C with the exception of a more powerful motor, longer wheelbase, larger body and electric lighting and electric motor starting systems. The equipment is very complete, including those accessories making for convenience in operation and comfort for the passengers. The same high grade material and workmanship noticeable of the product of the Havers company for the past two years are continued and both chassis are designed to meet the requirements of those desiring a powerful car capable of being maintained at a minimum cost.

Havers Series C, Six 44, Five-Passenger Touring Car with Ample Power and Completely Equipped.

As the same mechanical details apply to the Six 44 as to the Six 55, a description of the latter will serve for both. The cylinders of both motors are cast in pairs and those of the larger have a bore of four inches and a stroke of five, a bore to stroke ratio of 1:1.25. Although rated at 38.4 horsepower by the S. A. E. formula the company lists its product at 55, which does not appear to be excessive when the piston displacement of 376.9 cubic inches is considered. The bore of the series C motor is 3.75 inches and the stroke five, giving 33.75 horsepower according to the S. A. E. formula, but it develops 44 in block tests, according to the maker.

The four bearings of the crankshaft, which is ample in diameter, are plain, and the length of the centre members is three inches, that of the forward 3.5 and that at the flywheel end four.



Carburetion is by the latest type Stromberg, located on the left hand side of the power plant. Ignition of the Six 44 is by a Bosch high-tension magneto, dual system, while that for the larger motor is supplied by the combined lighting, starting and ignition system. Cooling is by thermo-syphon.

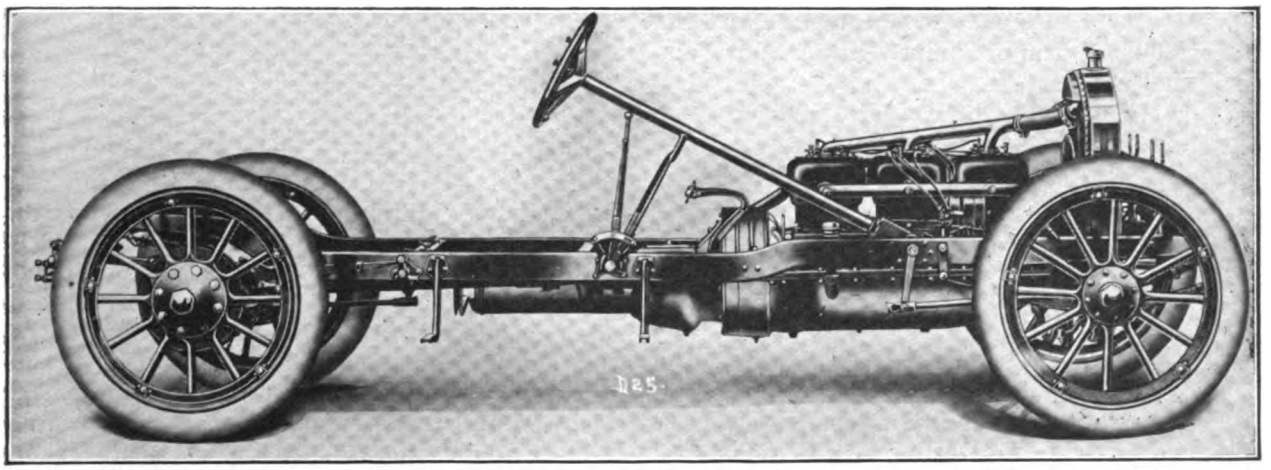
Lubrication is by a combination splash and force feed. The oil is pumped by a gear pump from the reservoir cast integral with the lower half of the crankcase through a distributing channel in the upper case to the main bearings and gears. The excess lubricant is collected by grooves or troughs into which the large ends of the connecting rods dip, splashing it to the pistons, rings, walls, etc. A multiple disc clutch is utilized, steel plates, Raybestos lined.

The transmission is of the conventional selective type having the usual three forward speeds and a reverse. All gears are of chrome vanadium steel, of ample diameter and wide face, and special attention is paid to cutting and tempering. The main and countershaft are liberal in size and rotate on annular ball bearings.

Drive is by shaft carried in a torsion tube with a full universal joint and slip joint on the transmission shaft. The driving strain of the rear

Digitized by Google

Havers Series D, Six 55, Knickerbocker Speedster, an Addition to the Havers Line—A Five-Passenger Touring Body Is Fitted to the Same Chassis.



axle is carried through radius rods. The rear axle is of the full floating type and the drive shafts are of 1.5-inch diameter nickel steel.

The frame is of pressed steel, heavy channel section, 30 inches in width at the front and 31.5 at the rear. It is dropped just back of the motor and has the usual kick-up at the rear, providing a low centre of gravity. The front springs are semi-elliptic, 40 inches long by two wide, while the rear are three-quarter platform, 36 inches long by two wide. Provision is made for lubrication of all parts subject to friction by fitting grease cups. The wheelbase is 128 inches, tread standard, 56. The wheelbase of the series C is 122.

The wheels are of the artillery type with large hubs and heavy spokes, and are fitted with Baker or Firestone quick detachable, demountable rims with one extra member as standard equipment. Tires are 36 by four inches, both front and rear.

The steering gear is of the worm and full wheel type, irrevesible and adjustable to wear. The steering column is heavily nickeled, 1.75 inches in diameter, and the wheel carries the usual gas and spark control members. Two sets of brakes are provided, the service member being of the external contracting type and the emergency of the internal expanding design. Both are fitted with equalizers. The fuel tank has a capacity of 20 gallons and the oil reservoir carries 1.75 gallons.

The driver is located at the right with control levers at the right, inside of the body. The clutch pedal is at the left and service brake member at the right. The usual accelerator is included. The touring bodies are of the latest fore door type and are noticeable for their straight lines, high grade finish and handsome appearance.

Chassis of Havers Six-Cylinder, Noticeable for Its Low Centre of Gravity, Powerful Motor and Accessibility of Components.

NATIONAL CONTEST AND RACING NEWS.

Itinerary Completed for Reliability Tour Which Succeeds the Glidden---Entries for Indianapolis 500-Mile Race---Concerning Coming Events.

ALL mention of the Glidden tour, as the annual national reliability run of the American Automobile Association has been known for so many years, is eliminated from the publicity concerning the 1913 event. As already announced the tour will start from Minneapolis, Minn., and end at the gateway of the Glacier national park in Montana, covering 1233.1 miles. The event is scheduled for July 11-19, and is to be known as the A. A. A. Twin City-Glacier National Park reliability tour.

The chief award this year will be the new A. A. A. trophy, an illustration of which is presented herewith. It stands 25 inches high and has a diameter of 24 inches, and around the top is a border depicting scenes in Yellowstone park, California, the White mountains and the South. On either side are figures symbolizing speed and endurance, and other official emblems are used with good effect. The trophy was made by the old established firm of Samuel Kirk & Sons Company, Baltimore.

The New A. A. A. Trophy.

The itinerary has been approved by the national association, as follows:

July	Noon	Night	Miles
Fri. 11....	St. Cloud, Minn.	Alexandria, Minn.	144.4
Sat. 12....	Fergus Falls, N. D.	Fargo, N. D.	123.8
Mon. 14...	Grand Forks, N. D.	Devils Lake, N. D.	194.6
Tue. 15...	Rugby, N. D.	Minot, N. D.	135.6
Wed. 16...	Stanley, N. D.	Williston, N. D.	136.8
Thu. 17....Poplar, Mont.		Glasgow, Mont.	163.8
Fri. 18....	Malta, Mont.	Havre, Mont.	156.1
Sat. 19....	Shelby, Mont.	Glacier Park, Mont.	178.0

Sunday, July 13, rest at Fargo, N. D.

The committee in charge is composed of the following: Dr. C. E. Dutton, Asa Paine and H. J. Clark, Minneapolis; E. W. Brazille, St. Paul; W. W. Smith, Fargo, N. D.; A. J. Davis, Butte, Mont.; N. H. Van Sicklen, Chicago, and James T. Drought, Milwaukee.

THE SWEEPSTAKE EVENT.

Entry List Includes at Least Two Cars Utilizing Knight Sleeve Valve Motor.

Entries closed May 1 for the third annual 500-mile international sweepstakes race on the Indianapolis motor speedway, Memorial Day. The list is particularly interesting because of the fact that this is the first American event of this character in which the Knight sliding sleeve valve motor has been in competition with the poppet valve type of engine. The entries include the following:

Car and Driver	Cyl.	Bore	Stroke
Stutz, Anderson	4	....	....
Stutz, Merz	4	....	....
Nyberg, H. Endicott	6	4.00	5.00
Keeton, Burman	4	5.09	5.50
Mason, Evans	4	4.31	6.00
Mason, Tower	4	4:31	6.00
Unknown	4	....	....
Stutz, Herr	4	....	....
Sunbeam, Guyot	6	3.54	6.29
Henderson, Knipper	4	4.31	6.00
Fox Special, Wilcox	4	4.75	5.50
Smada, Adams	4	3.50	5.00
Peugeot, Goux	4	....	....
Peugeot, Zucarrelli	4	....	....
Amel, Liesaw	4	4.50	5.00
Schacht, Jenkins	4	4.87	5.50
Mercer, DePalma	4	4.80	6.18
Mercer, Bragg	4	4.80	6.18
Mercer, Wishart	4	4.37	5.00
Mercedes-Knight, Pilette	4	3.93	5.12
Stearns-Knight	..	....	....
Isotta-Fraschini, Grant	..	....	....
Isotta-Fraschini, Tetzlaff	..	....	....
Isotta-Fraschini	..	....	....
Case, W. Endicott	..	....	....
Case, Nikrent	..	....	....
Mason, Houpt	..	....	....

The purse posted by the speedway management comprises $50,000, divided as follows: First, $20,000; second, $10,000; third, $5000; fourth, $3500; fifth, $3000; sixth, $2200; seventh, $1800; eighth, $1600; ninth, $1500; tenth, $1400. In addition, the famous speedway trophies have been revived and will be distributed as follows: To the driver leading at 200 miles, Remy grand brassard; 300 miles, Prest-O-Lite trophy; 400 miles, Wheeler-Schebler trophy. Special awards accompanying these as follows: Remy grand brassard, $50 a week for 50 consecutive weeks if car is equipped with Remy ignition; $1000 in

Digitized by Google

gold with Wheeler-Schebler trophy if machine is equipped with a Schebler carburetor. The Bosch Magneto Company, Hartford Suspension Company, Findeisen & Kropf Manufacturing Company and Emil Grossman offer additional special prizes for place cars using Bosch ignition, Truffault-Hartford shock absorbers, Rayfield carburetors and Red Head spark plugs, respectively.

OVERLAND WINS SECRET RUN.

Mrs. Waxham's Waverley Takes Award in Electric Division of Same Event.

The first automobile contest of the season in New York City was a secret time run from Columbus Circle to New Rochelle, May 2. Out of 59 entrants 54 started, and all but one finished. The event was run in two sections, one for gasoline machines and the other for electrics.

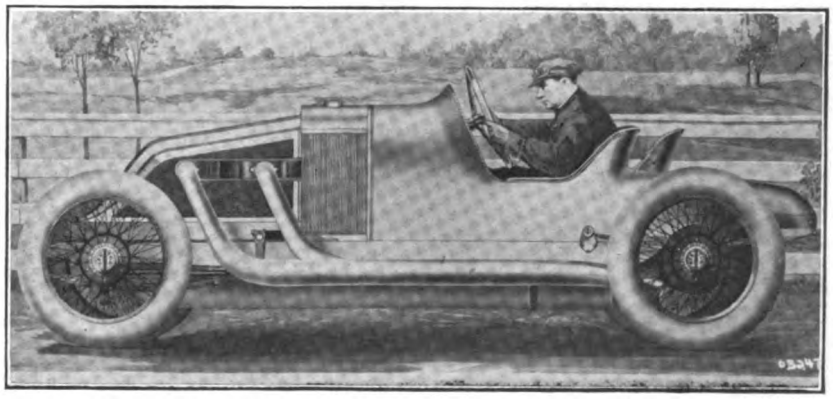
The secret time schedule was fixed at 56:21 for the gasoline division and 1:20:17 for the electrics. J. T. Kelly in an Overland won in the former class, his time being 56:50. Second place went to W. Cullen with a De Dion-Bouton, and third to Stella Mayhew in a Regal. In the electric class, Mrs. A. E. Waxham in a Waverley completed the trip in 1:24:49.6, taking first prize, while the second award went to P. S. Rogers in another Waverley. Others who competed were as follows:

Gasoline—Edward Cordier, De Dion-Bouton; J. H. Stelling, De Dion-Bouton; M. W. Colwell, Herreshoff; George H. Robertson, Hudson; C. W. Renner, Pope-Hartford; C. H. Larson, Oldsmobile; E. C. J. McShane, Mercer; I. M. Uppercue, Cadillac; Louis R. Smith, Cadillac; W. W. Jones, Cadillac; W. C. Poertner, National; K. C. Pardee, Inter-State; J. C. Nichols, Keeton; S. S. Toback, Hudson; Arthur Ferguson, Fiat; W. L. Van de Welle, Stevens-Duryea; J. Westerfield, De Dion-Bouton; T. B. Shoemaker, Studebaker.

Electric—Louis J. Rencke, Baker; Mrs. G. Rencke, Baker; Miss Florence F. Finch, Detroit; Dr. Charles Schram, Detroit; Dr. G. E. Mauer, Detroit; T. J. Jones, Detroit; Dr. S. P. Goohoot, Detroit.

FIFTH GRAND PRIZE RACE.

Entry Blanks as Issued Indicate Event Will Cover 400.4 Miles.



Entry blanks have been issued for the fifth race for the Grand Prize of the Automobile Club of America, which will be run under the auspices of the Savannah Automobile Club, at Savannah, Ga., Nov. 27. Besides the trophy, which is valued at $5000, there will be cash prizes as follows: First, $3500; second, $2000; third, $1000; fourth, $500. The length of the course is approximately 11.44 miles and must be covered 35 times, making a total of 400.4 miles.

No more than three cars of any one make are permitted to enter, and foreign entries should be made through the recognized automobile club of the country in which the car is manufactured. Entrance fees are as follows: One car, $1000; two, $1500; three, $1500.

CONTEST NEWS BRIEFS.

Two Cadillacs have been entered by Don Lee and S. A. McKee for the proposed road race from Los Angeles to San Francisco, to be held July 4.

Three entries have been received for the Montamara Festo races in Tacoma, Wash., in July. William Prince will drive a Cadillac, W. L. Alfred an Apperson and Joseph Dawson a National.

Robert Burman in Keeton Car Entered for 500-Mile Indianapolis Race.

The 200-mile race which is to be held under the auspices of the Columbus Automobile Club, Columbus, O., and originally scheduled for Sept. 1, has been advanced to July 4.

Among the entries for the Chicago-Boston non-stop run of the Chicago Automobile Club, scheduled for June 25-29, are the following: Packard, E. C. Patterson; Abbott-Detroit, A. M. Robbins; Abbott-Detroit, Abbott Motor Company; Staver, T. J. Hay; Staver, Staver Carriage Company; two Imperials, Imperial Automobile Company; Case, J. I. Case Threshing Machine Company.

Owing to the recent heavy floods in Ohio and Indiana, the three-day reliability run of the Ohio State Journal, Columbus, O., which was to have been held April 29-May 1, has been postponed until June 16-18. Because of the numerous bridges which were destroyed or damaged, the route also has been changed somewhat, and the tourists will now go from Columbus to Detroit, to Cleveland, to Akron, and back to Columbus.

As a result of his recent visit to the Pacific Coast, Chairman Schimpf of the contest board of the American Automobile Association reports an agreement with the Western Automobile Association. It is stated by President Frank A. Garbutt of the W. A. A. that his association has gained the point for which it was contending, which was an equal voice in the selection of the governing body officials, and that all drivers, mechanicians and officials operating under W. A. A. sanctions will be recognized by the A. A. A.

IN THE REALM OF THE MOTORCYCLIST.

Miami Cycle & Manufacturing Company Secures Auxiliary Plant in Indianapolis---Denver Convention to Be Held the Last Week in July---Club News.

ANNOUNCEMENT is made by K. R. Jacoby, president and general manager of the Miami Cycle & Manufacturing Company, Middletown, O., maker of Flying Merkel motorcycles, that his concern has secured the Prest-O-Lite building at Indianapolis, Ind., for an auxiliary factory to the already large plant at Middletown. The information comes somewhat as a surprise, despite the rapid growth of the Miami company, which has been one of the notable features of the motorcycle industry. In January the company occupied its new concrete and steel building, the addition embracing 55,000 square feet of floor space, but this extra room was insufficient for its operations.

Indianapolis Auxiliary Plant Acquired by Miami Cycle & Manufacturing Company.

The building at Indianapolis has just been vacated by the Prest-O-Lite Company, which has acquired a new and larger plant near the speedway. The motorcycle concern will use it for the production of complete motors, two-speed gears and band brakes. These will be the only items manufactured at the Indianapolis plant and in order to take care of the work President Jacoby has let the contracts for $100,000 worth of new machinery. Such machinery as is now in the Middletown factory which is used for the building of motors will be transferred to the Indianapolis factory, while part of the new purchase will be used in both places. The Indiana plant will be in charge of C. S. Barkelew, who has been engaged as mechanical engineer, and 800 men will be employed there. It is planned to have the new factory in operation by Aug. 1, when the 1914 models of Merkel motorcycles will be ready for the market. The output of the company for 1914 will be 25,000 machines.

During July and August the company will work its factory night and day in order that complete machines can be on hand for immediate deliveries during next season. The motors made at Indianapolis will be shipped to Middletown, where they will be block tested, after which the assembled machines will be tested on a circular track to be built within the factory grounds. A roof over the track will insure no interruption of testing because of weather conditions. The advantages of an exclusive motor, two-speed hub and band brake factory at Indianapolis are apparent. Of particular benefit is the ability to secure the highest grade of skilled labor. The net result will be an even better grade of motors produced on a more economical basis.

Convention Dates Selected.

It is announced that the annual convention of the Cycle Parts & Accessories Association will be held at Atlantic City, N. J., Aug. 5-8. The programme has not been completed, but a competent committee is in charge. The convention of the F. A. M. will be held at Denver, Col., July 30-Aug. 1, which will make the conclusion of that meeting rather close to the other association's gathering.

SO. BEND RESIDENT WANTS NAME OF YOUNG'S MACHINE

Saw the Article in Regard to the Wonderful Record Made by Fay Young's Motorcycle and Writes and Asks for Name of Machine.

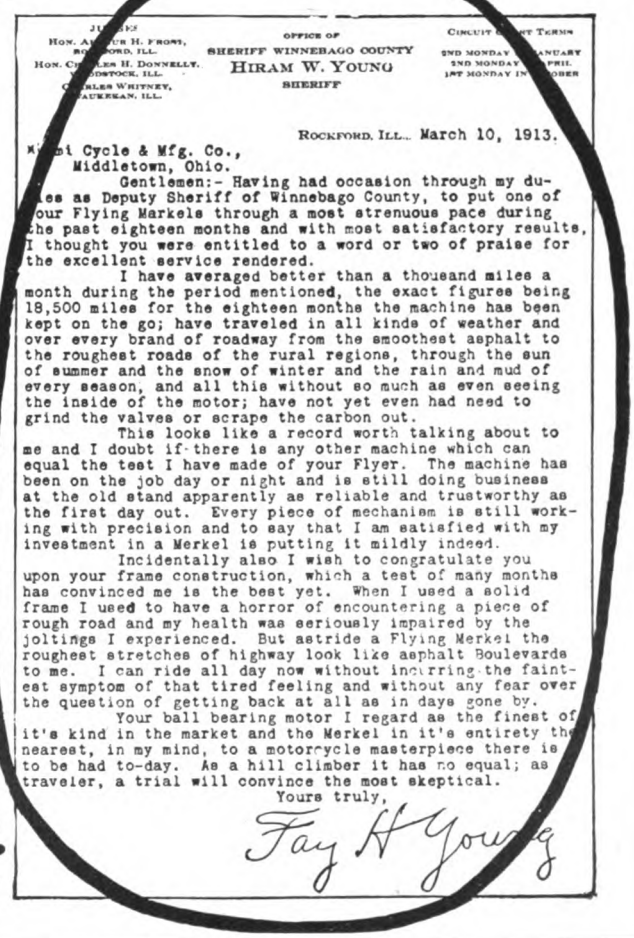
Deputy Sheriff Fay Young in opening his mail this morning found a letter from a resident of South Bend, Ind., the writer stating he had seen an article in regard to the record of the motorcycle ridden by Mr. Young, it traveling 18,000 miles without having a thing done to the motor, and he asked that the deputy forward him the name of the fachine and the year it was built. Deputy Young rides a twin cylinder Merkle, seven horsepower machine.

IN HYDRO-AEROPLANE

"The World's Best Motorcycle"

"Wonderful Economy." "Fastest machine on two wheels." "Lowest cost of upkeep," and similar phrases do not stand for much unless backed up by actual performances.

Read any of the motorcycle advertisements being published today. Nine-tenths of them are about as enlightening as the hieroglyphics on an obelisk of Pharaoh's time. Each machine is the best, but you must take the manufacturer's word for it. There is nothing to back up the cheerful statements and glowing typographical phrases.



THE SELFSTARTING-TWO SPEED-SPRING FRAME
FLYING MERKEL
MOTORCYCLE

"Made its name on Merkel Mileage"

What the rider should have is facts—indisputable incidents to prove the merits of the motorcycle being talked about. Every statement made by the makers of the Flying Merkel is substantiated by real performance. Sheriff Fay Young's experience is merely the experience of all Flying Merkel riders.

Have you seen our new art catalog, which fully describes the Self-Starting Two-Speed Flying Merkel Models for 1913? It's free for the asking.

1ST MONDAY IN OCTOBER

ROCKFORD, ILL., March 10, 1913.

Miami Cycle & Mfg. Co.,
Middletown, Ohio.

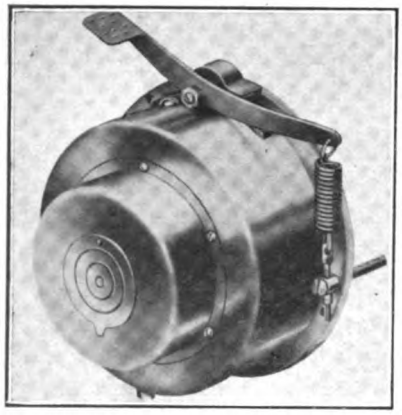
Gentlemen:- Having had occasion through my duties as Deputy Sheriff of Winnebago County, to put one of your Flying Markels through a most strenuous pace during the past eighteen months and with most satisfactory results, I thought you were entitled to a word or two of praise for the excellent service rendered.

I have averaged better than a thousand miles a month during the period mentioned, the exact figures being 18,500 miles for the eighteen months the machine has been kept on the go; have traveled in all kinds of weather and over every brand of roadway from the smoothest asphalt to the roughest roads of the rural regions, through the sun of summer and the snow of winter and the rain and mud of every season, and all this without so much as even seeing the inside of the motor; have not yet even had need to grind the valves or scrape the carbon out.

This looks like a record worth talking about to me and I doubt if there is any other machine which can equal the test I have made of your Flyer. The machine has been on the job day or night and is still doing business at the old stand apparently as reliable and trustworthy as the first day out. Every piece of mechanism is still working with precision and to say that I am satisfied with my investment in a Merkel is putting it mildly indeed.

Incidentally also I wish to congratulate you upon your frame construction, which a test of many months has convinced me is the best yet. When I used a solid frame I used to have a horror of encountering a piece of rough road and my health was seriously impaired by the joltings I experienced. But astride a Flying Merkel the roughest stretches of highway look like asphalt Boulevards to me. I can ride all day now without incurring the faintest symptom of that tired feeling and without any fear over the question of getting back at all as in days gone by.

Your ball bearing motor I regard as the finest of it's kind in the market and the Merkel in it's entirety the nearest, in my mind, to a motorcycle masterpiece there is to be had to-day. As a hill climber it has no equal; as traveler, a trial will convince the most skeptical.



Yours truly,

Fay H Young

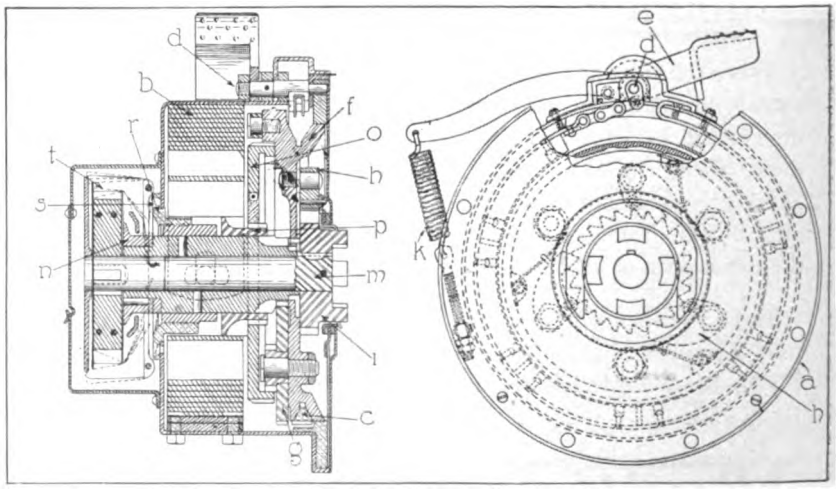
Details of Merkel Starter.



The Ever Ready starter employed on the Flying Merkel motorcycle is a mechanical device, nearly all of the mechanism of which is enclosed within a drawn steel shell a. It is designed to be attached in such position that its driving shaft is in direct alignment with the crankshaft of the engine, to which it is permanently secured by couplings. The power of the motor is stored in the main spring of the starter b, which is held in tension by the internal brake c, which consists of six V shaped segments riveted to a steel band. One end of the brake is fastened to the starter shell and the other to a short link chain that is secured to and which wraps around the chain stud d. The pedal lever e also is attached to this stud. The gear plate f, to which the reducing gears g and the starting dogs h are secured, acts as the drum to the V brake.

Ever Ready Flying Merkel Starter.

Pressure on the pedal expands the internal brake and releases the main spring, which in unwinding has a pressure greater than the compression of the engine, rotates the starting ratchet i and thereby turns over the engine crankshaft about eight complete revolutions, and at a speed of approximately 300 revolutions a minute, which is held to be sufficient to start any motorcycle motor on the magneto. When the pressure of the pedal is released the pull back tension spring k pulls the long end of the pedal lever e downward, wraps the link chain around the chain stud and brings the V shaped brake c down tightly in its seat and holds it down.

The running of the engine rotates the driving shaft m in the starter. The dogs in the clutch block, which is secured to the front end of the driving shaft, engage the bell crank shaped release dogs that are attached to the rewinding spider n, and thereby carry this spider around with the driving shaft. The teeth on the back end of the pinion arbor engage with and rotate the three gears g, which in turn rotate the internal gear o. This latter gear rotates the spring arbor p, to which the main spring is anchored, and the spring is thereby rewound to a tension that is regulated by the adjustment of the case nut r. As the spring arbor is being rotated the case nut screw s is gradually being forced forward until when the spring is rewound to the predetermined tension, this screw presses against the inner arms of the two release dogs t and forces the outer arms of these dogs away from the clutch dogs, when the rewinding mechanism immediately becomes idle and the driving shaft rotates freely with the engine crankshaft of which it is a part.

Sketches Showing Detailed Construction of Starter Used on Flying Merkel Machines.

Racing League's Plans.

The American League of Professional Racing Clubs will open its season about the middle of May and the decision announced is to offer an extra $500 purse, to be divided at the end of the season, among the three highest point winners in league races. Joseph Wolters, the Chicago rider, has decided to compete as a member of the Chicago team and he will probably be its captain. B. Carslake will be captain of Cleveland, Smiley of Cincinnati, Standen of St. Louis, while Gibson will probably head the Detroit team. At Luna motordrome, Cleveland, O., 60 riders are practising daily. Each rider is allowed 15 minutes each day on the track in order that all may have a chance to practise. Captain Carslake is in charge of the riders and as soon as they have had sufficient practise the teams to represent the various

Digitized by Google

cities will be selected with an eye to balancing them as nearly equal as possible. It is probable that a second training camp will be established at St. Louis because of the large number of riders who desire trials.

Salt Lake City Tracks.

The Wandamere Motordrome, Salt Lake City, Utah, will be controlled this year by the Motor & Bicycle Tracks Company, Inc., and the contract calls for at least one race each week, weather permitting, from Memorial Day to Labor Day. Harry W. Heagren is the manager of the company and he has secured the Salt Palace track. Both tracks, between which there has been much rivalry, will be handled this year by the same interests.

Merkel on Foreign Tour.

J. F. Merkel, chief engineer of the Miami Cycle & Manufacturing Company, Middletown, O., maker of Merkel motorcycles, has sailed for Europe, where he will make a pleasure tour through England, Germany, France and Belgium. He will incidentally study conditions in the trade make some interesting comparisons with the situation in America.

Brown Becomes Sales Manager.

Fred L. Brown, for the past five years manager of the Pacific Coast branch of the Pierce Cycle Company, Buffalo, N. Y., maker of Pierce motorcycles, has been appointed sales manager of the company, with headquarters at the factory in Buffalo. He succeeds to the positon formerly held by F. L. Johnson.

Official F. A. M. News.

The following repair shops have registered with the Federation of American Motorcyclists:

Emerald's Repair Shop, Butte and Walnut streets, Willows, Cal.; G. P. Manchester, 109 West Fourth street, Pittsburg, Kan.; Anderson Bros. & Bultinck, 211 North Michigan street, South Bend, Ind.; Major's Motor Shop, 309 Band street, Asbury Park, N. J.; William N. Burnett, Killingly, Conn.; Raymond C. Dalley, Three Bridges, N. J.; Glendale Garage, Glendale, O.; Jay C. Ree, Jefferson, Wis.; C. H. Lang, 1704 Michigan avenue, Chicago; Kenny Motor Company, 918 Main street, Lafayette, Ind.; Hawkeye Cycle Works, 707 Jefferson street, Burlington, Ia.; W. J. Sweet, 74 West Chicago street, Coldwater, Mich.; Germantown Cycle Company, 32 Armat street, Philadelphia, Penn.; Cap's Motorcycle Garage, 1110 Broadway, Ft. Wayne, Ind.

Newly affiliated clubs listed by the F. A. M. are as follows:

Willows, 15 members; secretary, C. A. Emerald, Butte & Walnut street, Willows, Cal. Hazelwood, 16 members; secretary, Ray F. O'Brien, 39 Hazelwood avenue, Pittsburg, Penn. Greencastle, 12 members; secretary, Leslie Vandament, 415 Depot street, Greencastle, Ind. Coldwater, 23 members; secretary, F. Leslie Treat, 21 South Hudson street, Coldwater, Mich. Chicago Indian, 57 members; secretary, A. C. Hertzer, 1849 Clifton Park avenue, Chicago. Hornell, 17 members; secretary, E. S. Whitney, 34 Armory place, Hornell, N. Y.

Club Notes, Here and There.

The National Capitol Motorcycle Club and the Washington Motorcycle Club, Washington, D. C., have held runs to LaPlata, Md., 35 miles distant, where dinners were served and the outings generally enjoyed. Numerous sidecars participated in the runs.

The Philadelphia Motorcycle Club has moved into its new quarters at 1728 Cherry street, Philadelphia, Penn., and a formal opening will be held soon, with appropriate exercises.

New quarters, which include a club garage, have been occupied by the Lorain Motorcycle Club, Lorain, O. The officers for the present year are: President, Edward Clotz; vice president, John Meikle; secretary, Floyd Blackfoot; treasurer, Charles Good; captain, G. W. Williams; lieutenant, C. B. Tunte.

The Salina Motorcycle Club, Salina, Kan., will entertain the Kansas Short Grass tourists when they visit that city in August. A banquet will be given and it is likely that a series of races will be arranged.

Motorcycle riders of Beloit, Wis., are agitating an endurance run to be over a course including Beloit, Elkin and Lake Geneva. An effort was made to hold a similar run last year, but at that time there were not enough riders to make it a success.

The Toronto Motorcycle Club, Toronto, Can., is planning an active season and according to present plans four hill climbs and five endurance runs will be held. The latter will probably be two-day affairs.

The Indian motorcycle riders of Philadelphia have formed an information class and each Friday night meetings are held, when talks on technical subjects are given and discussions held.

The Union City Motorcycle Club, Union City, Ind., has arranged for five competition runs, the first of which was held May 4. The riders are checked at secret controls and the winner of the series will receive a diamond medal valued at $100. The runs will be held the first Sunday of each month.

The Suburban Motorcycle Club was recently formed by riders at LaGrange, Ill., and the following officers were elected: President, Harry Anderson; vice president, Frank Evans; secretary and treasurer, Harry Bielby; first lieutenant, Edward Bluder; second lieutenant, Roy Lantz; road captain, Edward Bestler; directors, Frank Byron, John Bestler.

1913 F. N. SHAFT-DRIVE MOTORCYCLES.

Lightweight Single, with Two-Speed Gear $275
Only Machine Built With Handle Bar Control of Clutch.
Four-Cylinder $300
With Handle Bar Control of Clutch $350
Two-Speed Gear, Extra $50
Equipment includes two brakes, footrests if desired, compound spring fork, combined luggage carrier and stand.

American F. N. Company, Boston, Mass.

Branch—415 Trumbull St., Hartford, Ct.

NEWS OF MANUFACTURER AND DEALER.

The following concerns have been incorporated recently to manufacture and deal in automobiles, accessories, etc.:

Tottenville Garage Company, Tottenville, N. Y.; $500; I. A. Silver, Jr., G. W. Carfoot, E. L. Silvie.

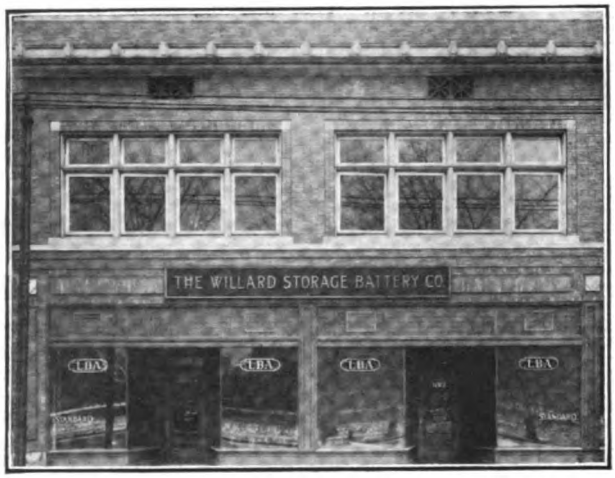
St. Louis Motor Bus Company, St. Louis, Mo.; $2000; R. J. Kirkwood, J. A. Rector, W. R. Mayne.

Richmond Hill Garage & Machine Company, Richmond Hill, N. Y.; $8000; M. E. Tunon, C. H. Ryan, Jr., A. F. Ryan.

Nodens Auto Trucking Company, Brooklyn, N. Y.; $10,000; A. Noden, B. H. Noden, L. F. Senkel.

Chambray Carburetor Company, Detroit; $50,000; to manufacture carburetors and motor car accessories.

National Automobile School of Cincinnati, Cincinnati, O.; $50,000; G. A. Hawley, H. G. Williamson, W. A. Evans, C. R. McComas, J. D. McCracken.



Worcester County Automobile Owners' Association, Leominster, Mass.; $5000; J. W. Healey, E. H. Divoll, H. A. Wood.

Auto Accessory Manufacturing Company, Holyoke, Mass.; $25,000; W. J. Shannon, E. A. Frary, E. N. Frary.

Vehicle Storm Apron Company, Hoboken, N. J.; $12,000; W. G. Lentz, D. Herr, A. Herr.

Platte Center Automobile Company, Platte Center, Neb.; $15,000; E. J. Macken and others.

Pressed Steel Motor Car Company, Cleveland, O.; $200,000; to manufacture parts and accessories; W. H. Milliken, F. M. Ossman, A. M. Heimberger, C. L. McConnell, L. C. Heimberger.

Willard Storage Battery Company's Detroit Branch.

Wagner Specialty Company, New York City; $5000; to deal in motor cars; A. F. Wagner, F. Walsh, M. Morris.

F. P. Motor Wagon Company, Pierre, S. D.; $250,000; L. L. Stephens, T. F. Graham, E. E. Slade, W. G. Price, R. J. Reynolds.

National Spark Plug Company, New York City; $10,000; R. L. Cherburg, C. B. Bennett, A. Boselman.

Auburn & Moravia Auto Bus Company, Moravia, N. Y.; $7000; E. C. Weaver, E. D. Parkhurst, F. W. Ackerman.

Mottlau Transmission Company, New York City; $250,000; to manufacture transmissions; A. J. Mottlau, Walter L. Post, T. F. Conrad.

Card Taxicab Company, Nashville, Tenn.; $1000; C. C. Card, G. Taylor, W. O. Taylor, C. W. Harle, C. S. Mayfield.

Still's Automobile & Accessories Company, New York City; $10,000; G. M. Still, G. Edwin Still, J. H. Still.

Carlough & Mallon, Newark, N. J.; $50,000; general motor car business; E. D. Carlough, F. V. Carlough, W. L. Mallon.

Elastic Tread Tire & Wheel Company, Cleveland, O.; $25,000; J. A. Murrey, R. E. Mollenkopf, F. J. Axel, P. Schneider, F. O. Joss, W. J. Young.

Schermerhorn Garage Company, New York City; $20,000; J. Ginsburgh, L. Rosett, P. A. Lee.

Cincinnati Alco Motor Car & Truck Company, Cincinnati, O.; $25,000; W. H. Peters, J. E. Kelding, G. S. Macduff, W. M. Macduff, H. W. Warren.

Imperial Auto Livery Company, Cincinnati, O.; $2000; S. F. Glassemeyer, W. Shullman, N. A. Michaelson, J. Lemkuhle, C. T. Ryan.

WITH THE MANUFACTURER.

The Weed Chain Tire Grip Company, maker of Weed chain tire grips and anti-skid devices, 28 Moore street, New York City, has located a plant on Logan street, Bridgeport, Conn.

The Motometer Company, Inc., New York City, has appointed W. D. Reeves of Franklin, Ky., the sole distributing agent of the company's radiator heat indicators, known as Motometers, for the entire state of Kentucky. Mr. Reeves will make his headquarters at Franklin.

The United States Tire Company has opened its new branch at Worcester, Mass., in the Graphic Arts building. L. C. Havener has been made manager.

E. W. Fowler, who was connected with the Stoddard Motor Company, New York City, previous to its suspension, has joined the Ward Leonard Electric Company, Bronxville, N. Y., maker of automobile starting and lighting equipment.

M. A. Magee, who for several years has been connected with the Motz Tire & Rubber Company, Akron, O., maker of Motz tires, has been appointed sales manager of the company, succeeding P. M. Pontius, who is specializing in the work of the electric pleasure car tire and is now in the position of manager of that department.

The Willard Storage Battery Company, Cleveland, O., maker of Elba storage batteries, has a number of branches located throughout the country, that at 1191-1193 Woodward avenue, Detroit, being shown in an accompanying illustration. This branch is in charge of Max G. Hillman, who is assisted by H. S. Gardner and E. F. Vincent, and like those at New York, Chicago and San Francisco, is prepared to charge batteries and do anything in the way of repairing. All the company's branches carry constantly in stock a large number of the most commonly used types of storage batteries and are in a positon to fill orders promptly.

J. R. Coleman, formerly connected with the E. R. Thomas Motor Company, Chalmers Motor Company, Hudson Motor Car Company and Packard Motor Car Company, has resigned as chief engineer and designer of the Atterbury Motor Car Company. Mr. Coleman is well known to the trade, having started with the Thomas company in 1904, when that concern was in its infancy. His most prominent previous connection was with the Hudson company as assistant chief engineer to C. H. Taylor. The distinct change of design in the Atterbury line of trucks is representative of his class of work.

J. C. Quimby, formerly connected with the Peerless Motor Car Company, Cleveland, O., maker of Peerless trucks and pleasure cars, and for a time manager of the Thomas factory used car department, has joined the sales force of the Packard Motor Car Company of Boston as assistant manager of the used car department.

Edward S. Babcox, formerly advertising manager of the Yawman & Erbe Manufacturing Company, Rochester, N. Y., maker of filing systems, is now advertising manager of the Firestone Tire & Rubber Company, Akron, O., maker of Firestone tires. J. S. Sleeper, former advertising manager of the Firestone company, is now general sales manager of the Colonial Printing Company, Cleveland, O.

The Wheeler-Schebler Carburetor Company, Indianapolis, Ind., maker of Schebler carburetors, has established a publicity department in connection with its advertising department. Joseph Kelly, a well known Indianapolis newspaperman, a specialist in automobile work, has been placed in charge.

The Cole Motor Car Company, Indianapolis, Ind., maker of Cole cars, has appointed the following agents: Miller Auto Company, Bay City, Mich.; B. A. Quinlan, Bennington, Vt.; Virginia City Motor Company, Danville, Va.; B. L. Taylor, Denton, Tex.; Dr. J. A. Niles, Great Falls, Mont.; S. C. Weaver, Lewistown, Mont.; C. J. Mur-

Digitized by Google

ray and F. D. Daniels, Mason City, Ia.; Lane Manufacturing Company, Montpelier, Vt.; C. M. Crim & Son, Salem, Ind.; A. H. Tuttle, Sheffield, Mass.; J. M. Hudgens, Stamps, Ark.

W. E. Jackson has been appointed by the Henderson Motor Car Company, Indianapolis, Ind., maker of Henderson cars, as territory manager for southern Illinois, with headquarters in Indianapolis. Mr. Jackson is well known in his territory, having covered it since August, 1912, for the American & Marion Sales Company of Indianapolis.

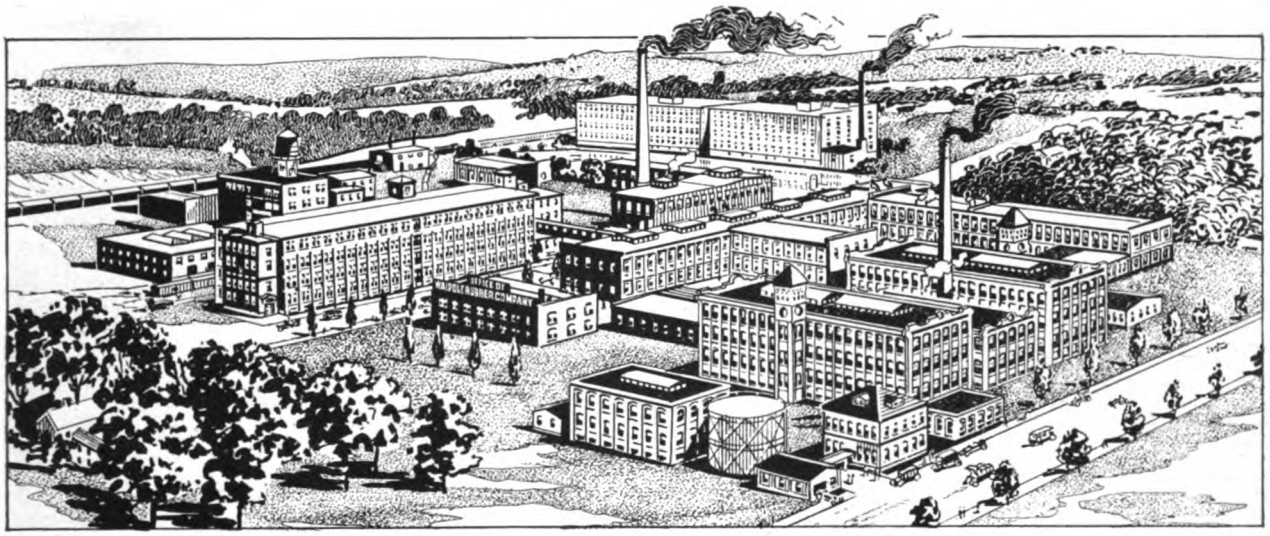
The Walpole Tire & Rubber Company, with sales offices at 757 Boylston street, Boston, Mass., has three well equipped factories located in Walpole and Foxboro, Mass., and Granby, Que. A general view of the main plant is shown herewith, and it may be stated that the others are quite as modern in every particular, being fitted to produce tires and tubes to meet the requirements of motorists and to have a standard for quality and service which is unsurpassed.

GARAGE AND DEALER.

The Kolb Sales Company, with offices in the United States Rubber building, Fifty-eighth street and Broadway, New York City, has recently been organized to represent the interests of different automobile accessory and specialty manufacturers in the eastern territory. Milton B. Kolb, who has been identified with various branches of the motor car industry in the past 10 years, is at the head of the new organization.

The James Bailey Company, Portland, Me., has been appointed state distributor of the well known Invader lubricants, made by the Invader Oil Company, New York City. The company expects to greatly enlarge its oil sales by handling this brand of lubricants.

The G. R. Cowie Company, Inc., Washington, D. C., distributor of Cole cars, made by the Cole Motor Car Company, Indianapolis, Ind., has taken over the G. R. Cowie Company, and the following officers have been elected: President, G. R. Cowie; vice president, L. Bert Nye; treasurer, E. S. Wolt; secretary, W. H. Bennett. The new concern also acquires the Standard garage, 2121 Fourteenth street, to which improvements will be made.



The Case Motor Sales Company, St. Joseph, Mo., was recently formed and is located in the garage formerly occupied by the Klos Motor Car Company at Second and Faron streets. G. R. Livergood is manager of the concern and J. C. Gifford is secretary and treasurer.

The Merwin Gasoline Company, Pittsburg, Penn., which was recently granted a state charter, has awarded the contract for the building of its new home in Grant boulevard, near Thirty-third street. The building will cost $3500. A large plot of ground was purchased and the unused portion will be held to await further development.

Harry J. Twitchell, who in 1911 and 1912 represented the Cole Motor Car Company, Indianapolis, Ind., maker of Cole machines at Portland, Ore., and who helped form the Christofferson Aviation Company at San Francisco, Cal., has returned to the industry. He has joined partnership with E. B. Snyder at Spokane, Wash., and they will operate under the name of Cole-Spokane Company.

E. Louis Kuhns, who for the past 18 months has been manager of the Studebaker interests in New York and New England, has retired from active service, although he will remain as a director of the Studebaker Corporation, Detroit, maker of pleasure cars and trucks. Mr. Kuhns went to New York from Chicago, where he had charge of the corporation's interests for four years. Altogether he has been 20 years in the service of the concern. He will reside in Chicago. R. T. Hodgkins is now in charge of the horse vehicle business for the Studebaker in New York City, and George H. Phelps is in charge of the automobile division.

Louis Jandorf, dealer in second hand cars, has taken a lease of the United States Motor Company building on Sixty-first street, near Central Park West, New York City, and will combine his various establishments under one roof. The building has seven stories, each floor being 200 by 75 feet. It is understood that the annual rental is about $40,000. This deal, coupled with the fact that the Times Square Automobile Company not long ago took over and remodelled the Wyckoff, Church & Partridge building at Fifty-sixth street and Broadway, is significant of the importance of the second hand automobile business. Jansdorf's former place has been taken by the Cadillac company, which will have its salesroom diagonally across the street on the Broadway corner. The factory at Fifty-eighth street and Eleventh avenue has been taken by the United States Rubber Company.

General View of the Main Plant of the Walpole Tire & Rubber Company, Where Walpole Tires Are Produced.

C. W. Robinson has completed extensive alterations to his Cole service station and electric garage at Peoria, Ill., making it one of the most modern automobile homes in the state outside of Chicago.

The W. D. Sweet Motor Car Company, Binghamton, N. Y., has purchased the business of W. A. Crandall Company, 233 Water street, and will make that city its distributing point for Speedwell cars in Pennsylvania and New York.

George M. Bullock, Great Barrington, Mass., has sold his garage business to Elton S. Jones.

Batdorf & Stampfle, Paterson and Detroiter agent, Columbus, O., has dissolved. W. H. Batdorf will continue as the Paterson agent and has joined with Frank P. Corbett, state distributor for Detroiter machines.

F. W. Trowbridge, Thomaston, Me., has purchased the Stackpole buildings on Green street, which he will convert into a garage to conduct in connection with his hotel, the Knox house.

J. W. Tyler and Walter Fisk, Harvard, Ill., have purchased the business of the Economy Garage Company. Numerous improvements will be made.

RECENT PATENTS.

Hub for Detachable Wheels, Pierre Lapertot and Antoine Fayard, St. Etienne, France, No. 1,057,561. In a hub for detachable wheels the combination of an inner hub member having a part conical surface at its inner end, an outer hub member engaging on said inner hub member and having a part conical surface coacting with said conical surface of the inner hub member, an annular conical wedging member comprising segments adapted to be engaged between the inner and outer hub members at the outer ends thereof, a screw plug adapted to be screwed into said inner hub member to force the said wedge member between the inner and outer hubs, tongues on the sections of said wedge member engaging in a groove of the plug, a spring connecting said sections and means for preventing accidental loosening of the parts.

Tire, Elbert Charles Rhodes, Chicago, No. 1,057,580. A tire comprising a sheath, a plurality of inflatable compartments permanently connected at their ends and arranged therein, an air tube communicating with all of the compartments, an inflating valve carried by the tube, and means for cutting off communication between the tube and any one or more of the compartments.

Gas Engine Cylinder, Thomas W. Keene, Swissvale, Penn., No. 1,057,741. A sectional gas engine cylinder comprising end sections, a segmental filling ring between the adjoining ends of the cylinder sections and bushings in the cylinder sections, the outer surfaces of said bushings tapering and the bushings being inserted in the cylinder from the adjoining ends of the cylinder sections and engaging the ends of the filling ring to prevent movement of the bushings in the cylinder.

Vehicle Steering Mechanism, Samuel H. Kennedy, Tunnel Hill, Ga., No. 1,058,758. It comprises an actuating member fulcrumed upon the vehicle axle, guide members pivotally mounted in said actuating member, bars connected at their ends to the wheel spindles, the inner ends of said bars being provided with longitudinal slots to receive the pivoted guide members, and coil springs arranged in slots upon opposite sides of the guide members to yieldingly prevent movement of said bars independently of the actuating member.

Shock Absorber, Samuel H. Yancey, South Bend, Ind., No. 1,058,834. The combination with the truck and body of a vehicle and a vehicle spring interposed between said truck and body, of a shock absorber disposed centrally of the spring and including a spring arranged on a normal centre and adapted to be carried to one side or the other of said centre by the first spring and acting with said first spring in the initial movement thereof and against same on the rebound.

Headlight Steering Mechanism, Frederick H. Young, Wilmington, and George N. Cameron, Marshalltown, Del., No. 1,058,835. The combination with a spring supporting side frame bar, front axle and steering wheel of a vehicle, of a vertically disposed extensible connecting element supported for a partially revoluble movement by said frame bar and front axle, respectively, whereby when the spring yields, said element may be shortened correspondingly, said element being provided with upper and lower crank arms, a headlight mounted for a turning movement, and pivotal connections between the said crank arms and said steering wheel.

License Tag Holder, Daniel R. McCauley, Washington, D. C., No. 1,058,882. A license tag holder, comprising two gripping members arranged to grip the upper and lower edges of a plate or tag, and having tag-engaging lips, a spiral spring connecting said members, each member being provided with a vertical extension, the extensions formed to provide a smooth backing for the spring, said springs and extensions forming a backing for the face of the tag, opposed to that engaged by the lips of the gripping members.

Internal Combustion Engine, John Loftus, Albany, N. Y., No. 1,058,992. In an internal combustion engine, a power cylinder provided with a valved cylindrical abutment extending therein and forming an annular combustion chamber, and a trunk piston shell forming a compression chamber in front of said cylindrical abutment and provide with charge transfer members adapted to co-operate with said valved cylindrical abutment and open and close communication between said combustion and compression chambers.

Speedometer Driving Pinion Support, Augustus W. Wessoleck, New Britain, Conn., assignor to the American Hardware Corporation of the same city, No. 1,058,930. A speedometer driving pinion support for use in connection with yieldingly mounted wheels comprising a rigid fork, a wheel yieldingly mounted thereon to move up and down relatively thereto, an axle for said wheel, a plate rigidly carried by said axle, said plate having a concentric slot, a driving gear carried by the wheel concentrically, a driving pinion with a goose neck arm having a bearing at one end freely movable in the slot of said plate, with means at the other end for supporting the pinion, and guide means for said pinion arranged to be carried by said rigid fork.

COMING EVENTS.

May.

May 14-15—Scenic tour, West Hudson and Catskills, N. Y.
May 26-June 13—American visit, British engineers.
May 30—500-mile race, Indianapolis, Ind.
May 30—Inter-Club run, Chicago, Ill.

June.

June 16-18—Reliability run, Columbus, O.
June 19—Algonquin hill climb, Chicago, Ill.
June 25-28—Non-stop day and night run, Chicago-Boston.

July.

July 1—Manufacturers' tour, Indianapolis-San Francisco.
July 4—Track meet, Taylor, Tex.
July 4—200-mile race, Columbus, O.
July 4-5—Track meet, Sioux City, Ia.
July 11-19—A. A. A. tour, Minneapolis-Glacier Park.
July 4-6—Road race, Tacoma, Wash.
July 27-28—Road races, Tacoma, Wash.

August.

Aug. 29—Chicago Trophy race, Elgin, Ill.
Aug. 30—Elgin Trophy race, Elgin, Ill.
Aug. 30-Sept. 6—Reliability tour, Chicago, Ill.

September.

Sept. 1—Fire chiefs' convention, Madison Square Garden, New York.

November.

Nov. 24—Vanderbilt Cup race, Savannah, Ga.
Nov. 26—Grand Prize race, Savannah, Ga.

FOREIGN.

May.

May 1-31—Show, Barcelona, Spain.
May 7-21—Show, St. Petersburg, Russia.
May 8-12—De la Sarthe race meet, Le Mans, France.
May 11-12—Targa Florio race, Sicily.

June.

June 4- 6—Tourist Trophy race, Isle of Man, England.
June 10-16—Alpine trials, Vienna, Austria.
June 23-28—International road congress, London, England.

July.

July 1-16—Plowing competition, Winnipeg, Manitoba.
July 12—Grand Prix race, Amiens, France.
July 19-20—Grand Prix race, Belgium.

August.

August 10—Hill climb, Mount Ventoux, France.
August 15—Hill climb, Tonale, Italy.

September.

September 28—Hill climb, Mont Verdun, France.

NEW BOOKS RECEIVED.

Good Roads Year Book—Published by the American Highway Association, Colorado building, Washington, D. C.; from the Waverley Press, Williams & Wilkins Company, Baltimore,; edited by J. E. Pennybacker, Jr. An interesting compilation, containing the history of road building and reports of work accomplished and contemplated in the various states. The subject is treated exhaustively and the reports are authoritative. Comprises 548 pages. Price, $1.

Digitized by Google

MERCER WINS TWICE.

Takes Challenge Trophy in Ten-Mile Event Over New Bakersfield Speedway.

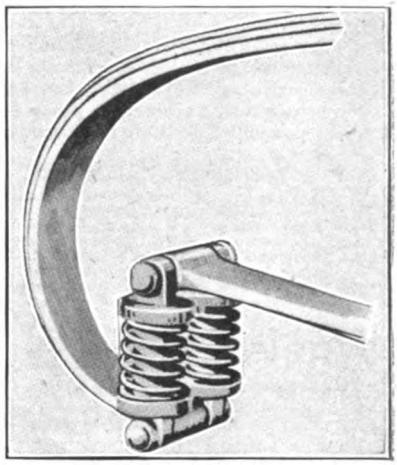
At the opening meet on the new Bakersfield speedway in Bakersfield, Cal., April 27, a 300-cubic inch Mercer raceabout, made by the Mercer Automobile Company, Trenton, N. J., won the principal race of the day, a 450-cubic inch event for the $1000 challenge trophy, covering the 10 miles from a standing start in 10:10. Following this race the same car started in a 300-inch five-mile event, winning easily in 5:04.

The second day of the meet the same little car was pitted against others of larger horsepower in a handicap event and was defeated only by a wheel length by Barney Oldfield's record breaking front drive Christie machine.

NEXT YEAR'S BOSTON SHOW.

Commercial Vehicle Dealers Decide to Hold Another Truck Display.

At a meeting of the Boston Commercial Motor Vehicle Association in Boston, May 1, the matter of holding a truck show for 1914 was fully discussed. It was the almost unanimous opinion of those present, and the expression of several who were unable to attend was equally as emphatic, that the plan which has been in vogue for the past two years should be continued.



The pleasure car show has been scheduled for March 7-14, and it is proposed to hold the truck display March 17-21. Already the clerks in the office of General Manager Chester I. Campbell are busily engaged in the work of preparation, and Mr. Campbell predicts the most successful expositon of the business vehicle industry.

SUMNER ENLARGES LINE.

Acquires Patents and Rights for Prominent Foreign Accessories, Including Diva Headlight.

George Sumner, president of George Sumner, Inc., New York City, has returned from a visit to Europe, where he secured some valuable patents and manufacturing rights on automobile accessories that have become standard abroad. One of the most prominent is the Diva headlight, which although fitted with an eight candlepower bulb will throw illuminating rays for 600 yards ahead of the driver, as well as show clearly both sides of the road. It resembles somewhat a diver's headlight, and one of its several features is that glaring effects are eliminated; that is, occupants of approaching vehicles or pedestrians are not blinded by the rays, being able to see the road on either side of the machine. The upward, rising rays are also eliminated, making operation in fogs possible and with a maximum amount of light. The construction of the Diva is such that every ray is collected and utilized before leaving the headlight and the light may be said to be five powerful searchlights in one.

The company has also secured the patents and the rights to manufacture the Acme shock absorber, which is in the form of spring shackle, being substituted for the latter. It consists of two sliding, interlocking parts, both of which are alike and these are held in position by a coil spring, as will be noted by the accompanying illustration. When substituted for the regular shackle it connects the rear ends of the leaf springs, absorbing vibration and relieving the vehicle of all road shocks. The device is very compact and simple, easily fitted, and is very moderately priced.

Acme Shock Absorber.

George Sumner, Inc., is also selling agent for the celebrated English carburetor, the S. U., which is described and illustrated elsewhere in this issue. The concern is now located at 1926 Broadway, New York City, and a full line of machinery has been installed, adequate in every way to meet the requirements of fitting carburetors, Diva headlights, Acme shock absorbers and other products of the company.

Mr. Sumner has also identified himself with the Brooklyn Water Heater Company, and will represent its interests in Manhattan, the Bronx, Westchester and Staten Island. He is also agent for Hopewell Bros., Newton, Mass., in New York City, and will cover the states of New York, New Jersey and eastern Pennsylvania. Hopewell Bros. is maker of the well known Hopewell tire cases, etc. These latter two lines will be conducted at 1974 Broadway.

Digitized by Google

"There's Where YOU Are Wise!

That Other Fellow is a Menace to Everyone's Safety"

Nine-tenths of all automobile accidents are caused by skidding and by foolish dependence on rubber alone. In these days of crowded streets and congested traffic, the motorist who does not take precaution to guard against every possibility of disaster is *next to criminal.*

"The ever-present danger that is quite as much of a terror to the experienced driver as it is to the novice is **skidding.** There is nothing that makes a man lose his nerve so thoroughly or dread a repetition of the experience so keenly as a bad skid that ends in a broken wheel against a curb, or that makes matters far worse by 'sideswiping' a moving trolley car. To feel the car start to slide from under you, aiming directly at the nearest obstruction, despite all manipulations of the wheel and brakes---well, once is too often."

Weed Anti-Skid Chains

VS.

Slipshod Traffic

Traffic policemen, by the hundreds, interviewed in all the large cities throughout the country, express the unanimous opinion that their work would be greatly reduced; that nearly all **skidding accidents would be eliminated** if motorists would take the precaution of always carrying WEED CHAINS, and putting them on when the roads and pavements are wet, slippery and uncertain, or covered with snow.

Some of these **guardians of public safety** go so far as to say that the time is not far off when State Legislatures will make **the use of WEED CHAINS compulsory,** for the protection of life and property.

Make Safety Yours

Take no chances. Fully equip your own car with WEED CHAINS and **insist,** for your own protection, that other drivers do the same.

On the Rear Tires

they afford perfect traction and adequate brake control.

On the Front Tires

they act as ladders to enable the front wheels to easily climb out of mud-ruts, car tracks and all uneven places in pavements or roads, always insuring absolute steering control, eliminating all chance of the front wheel skid.

If you haven't a set of **WEED CHAINS,** or if you have a pair for the rear tires only, **get a full equipment now.** Delay is dangerous. Stop at your dealers today and **WEED CHAIN** your car to safety.

American Automobile Association to Be Represented at Conventions in Holland and England.

The American Automobile Association will be represented in the two important international gatherings the coming summer. The first of these is the Ligue Internationale des Associations Touristes congress at Amsterdam, Holland, June 18-21, where the association's delegate will be Bernard Van H. Schultz of New Jersey, who is making a 5000-mile tour of Europe. Mr. Schultz has been a most extensive European motor traveller and in the course of his several tours abroad has traversed practically all of the important mountain passes.

For the international road congress, to take place at London, England, June 23-28, of which the A. A. A. is also a member, James H. Cook of Alabama has been appointed. This assemblage of roads enthusiasts of the world will be a most important affair, and it is not unlikely that the A. A. A. will have several delegates in addition to the one already selected. Mr. Schultz may arrange to join Mr. Cook, who, in company with Maj. W. W. Crosby of Maryland, will precede his visit to London by an automobile tour of the continent.

Men who follow the fortunes of the rubber trade estimate that the automobile tire industry alone today consumes as much rubber as was the world's total supply of crude rubber 15 years ago. Furthermore, a liberal 40 per cent. of the crude rubber product of the present goes into tires and motor car accessories. Statisticians figure the 1913 crop at approximately 108,000 tons, of which nearly 45,000 tons will be consumed in factories identified with the automobile industry..

Can We Send You a Copy of this Booklet?

OUR ENGINEERING DEPARTMENT has published the first of a series of booklets discussing the lastest developments in the solving of bearing problems.

¶ This first brochure is entitled "Bearing Friction and Its Elimination," and aims to show why balls are superior friction reducers and how their correct application secures maximum conservation of energy.

¶ The types of bearings particularly discussed and compared in this writing are the ball and roller bearings, as applied to all bearing points in the motor car.

¶ It discusses and explains the growing tendency among engineers and manufacturers to favor the ball type of bearing, as evidenced by the summarization figures published by the "Horseless Age" in a review of 1913 pleasure car models. These figures show that ball bearings are used in the differential of 53% of the pleasure cars for 1913, as against 37 1-2% of the 1912 models; in the transmission of 75%, as against 64%; and in the rear wheel of 52%, as against 42%.

¶ This brochure will interest you. Copy will be mailed you promptly on request.

Even with porcelain BROKEN it sparks perfectly

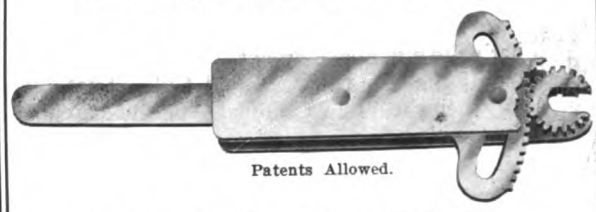
Unlike all other plugs, J-M Plug sparks just as well with the porcelain broken, as when it is whole—even when the current is supplied by a magneto. This perfect sparking service is made possible by the double insulation of the

J-M SPARK PLUG

There are two absolutely independent insulations in the J-M Plug ---an inner insulation of mica protected from injury by a porcelain insulation. If the porcelain is broken, the mica prevents current leakage, and sparking will be just as strong as if the plug were not damaged.

Other exclusive features of the J-M Plug are---

Case hardened center electrode that cannot expand and contract when heated by the engine. All joints packed with asbestos or high temperature cements, baked so that they never require adjustment or "tightening up."



Look for the name "J-M" on every plug. Shipped direct, prepaid, from our nearest branch on receipt of price, $1.00, if your dealer doesn't sell them.

Brown Scientific Tube—The Ultimate Tube

WILL NOT DEFLATE WHEN PUNCTURED

BECAUSE, by materially thickening the tread portion of the tube, and then, after the tube is vulcanized, turning it inside out, the rubber in the tread is put under compression sufficient to securely and automatically close the puncture. This compression is aided by an insertion of extremely high grade non-elastic fabric.

The reinforced tread, permits casing to wear practically through. THIS SPELLS ECONOMY.

Among our users and buyers are 14 of the most prominent manufacturers of motor cars.

Being an AIR FILLED TUBE, it does not interfere with the guarantee given by tire manufacturers.

NO DOPE—NO FILLER—NOTHING BUT AIR

Reliable Agents Wanted. References Required.

If the M&M ECONOMIZER

Could Talk We Would Not Have to Advertise

The M&M is GUARANTEED to save from 40 to 50% of gasoline, and increase the SPEED and POWER 20% with less gasoline, and less carbon. With the throttle set at 12 miles per hour, by opening the M&M, your mileage will be increased to 18 or 20 miles, with the SAME AMOUNT OF GASOLINE, and less carbon.

STEERING POST CONTROL

The M&M requires a ¾" pipe tap to insert into manifold, but same can be reduced to ½" if necessary. The Motorcycle size is ¼". The M&M is made with one ground valve and six portholes, which when open, admit auxiliary air into the manifold, giving you that uniform mixture, which is POSITIVELY NECESSARY in order to obtain SPEED AND POWER.

HOW ABOUT THIS LETTER! Then watch for the next:—

Boston, Mass., No. 434 Harrison Ave., April 22, 1913.

Moller Bros., Philadelphia, Penn.

Gentlemen:—In reference to my experience with the M&M Economizer, will say that I am using same on a model B 40, Cutting car. My carburetor is a model O Shebler. I am getting about five miles per hour more speed and from three to four miles more on a gallon of gasoline than before I installed the M&M Economizer. I am very much pleased with it and have recommended it to my friends. Yours very truly,

(Signed) FRANK K. LAUE.

WE GUARANTEE THE M&M ECONOMIZER TO DO JUST WHAT WE CLAIM, or money will be refunded in 30 days. Reference—Citizens National Bank, Lewistown, Penn. No dealer or jobber is authorized to sell without our guarantee.

PRICE OF AUTOMOBILE ATTACHMENT, $3.50 complete. (17c extra for postage.) Either foot pedal or steering post control will be included.

PRICE OF MOTORCYCLE ATTACHMENT, $1.25 prepaid. The M&M is nickel plated and highly polished.

20 Miles to Gallon

Lawrence, Mass., July 13, 1912.
Gentlemen:—Enclosed find check for carburetor. I feel perfectly satisfied. It does 20 miles and over on a gallon. Can recommend it to anyone. G. A. Schmidt.

19 to Gallon on Cadillac

Planhard Co.—Edgewater, N. J., May 21, 1912.
I am very much pleased with my new Planhard Carburetor. I made a test of gasoline consumption from Edgewater to Hyde Park, N. Y., and return, and got a fraction over nineteen miles to the gallon. This is on my Cadillac.
John H. Hinners.

More Speed—Start Cold

Groton, Conn., Feb. 8, 1913.
Dear Sirs:—I put a Planhard on my single cylinder 6-8 h. p. Goshen engine. It gives 50 R. P. M. more than the ——— I took off. With the Planhard I can start cold or hot without priming, which few others can do. Yours truly, E. A. Scriven.

3¾ More Miles

When Planhard Carburetors were put on the 6 cylinder, 4 cycle Frisbie motor of the fast boat Delphi II, she increased 280 R. P. M., and 3¾ more miles per hour.

Much More Power

Bath Marine Construction Co.—"The gasoline consumption at normal power was better than others and it would develop much more power when pushed." H. D. Bacon, President.
"Fifty miles without a miss."—Geo. E. Grosvenor, Crescent, Mich.
"To use the vernacular, 'some carburetor.' "—W. R. Fleming, 3311 Broadway, N. Y.

If you own a FORD!

Chicago, Ohio, July 1, 1912.
Gentlemen:—The Planhard Carburetor for my model S Ford Car is very satisfactory. I never bought anything for my car I paid so cheerfully for, as I have a smoother running engine with more power and get *more mileage per gallon* and my engine runs much cooler. H. W. Grandon.

Gallon Less Per Hour!

INFRINGEMENT SUIT

We have begun suit against the J. M. Shock Absorber Company of Philadelphia, Pa., for infringement of our patent No. 988,229, granted March 28, 1911. We will prosecute all other infringers of our patents.

PIONEER of All Spring Shock Absorbers Operating on this Principle

The Blackledge Shock Absorbing Spring was first brought out in 1909.

This idea of making the spring yield at the shackle (or point of connection of the two halves of the main spring) has grown so in popularity that this principle has been copied the world over, so that today probably two-thirds of the cars in Europe are using the Blackledge Principle or an imitation.

However, for genuine merit, easy riding qualities, simplicity and durability, the imitators have never been able to equal the Blackledge, the pioneer in its class.

Insist on having your new car equipped with

The Repair Man Who Gives Good Advice

No one knows better than the mechanic in the repair shop that POOR LUBRICATION is the cause of worn out bearings and gears, and though NEEDED REPAIRS are the basis of part of the repair man's business, *preaching*, *practicing* or *providing* poor lubrication is the last thing he would think of doing.

His prosperity is built upon honest service, upon honest advice and honest workmanship. He gets more thanks, more good will and more business for his help in *minimizing* repairs than he does for his skill in *making* repairs.

The repair man who points out lubricating mistakes and advises the use of

TRADE MARK REGISTERED IN
NON-FLUID OIL
UNITED STATES PATENT OFFICE

for bearings and gears and sells NON-FLUID OIL to his patrons is the man to whom every motorist owes his consideration when repairs are necessary.

THE REPAIR MAN WHO SELLS THE BEST LUBRICANTS IS THE MAN WHO KNOWS THE PENALTY OF USING POOR ONES AND URGES YOU TO AVOID THEM.

Patronize the repair man who sells NON-FLUID OIL.

The "Black Eagle" Spark Plug

PATENTED

50 Cents Is Enough

The "Black Eagle" Spark Plug has made good because it was designed and manufactured with this result in view.

A person in close touch with the supply and manufacturing ends of the trade was a visitor at our factory recently, and was shown the details of construction, including the machinery, testing, and assembling of the "BLACK EAGLE" Spark Plug. What he said we believe will be of interest to you, as it indicates the effort on our part to supply a high grade plug at a reasonable price. We therefore quote below his impressions.

> "I am simply amazed at the workmanship, material, and construction of the 'BLACK EAGLE' Spark Plug. When I saw this plug advertised at a price of 50c to the consumer, I naturally supposed it was a cheap, common, plug such as you occasionally find in jobbing houses on the bargain counter. I am convinced, after seeing these plugs tested, and examining minutely the machine parts which enter into their construction, that **no better porcelain spark plug is offered by any one, regardless of the price they ask.**"

We are not **influenced** by what our competitors **charge for spark plugs!** We have **ignored price precedent,** for the reason that a **high grade spark plug** can be manufactured and sold at **50c each, and that is enough.**

Sent prepaid on receipt of price. Made in all standard threads.

THE STANDARD CO. TORRINGTON, CONN., U. S. A.

MIGHTY MICHIGAN "40"

40-Horsepower Touring Car or Roadster, absolutely silent in operation. Oversize tires 35x4 1-2---cylinders 4 1-4x5 1-4 in.---118-in. wheel base---four-forward-speed transmission ---demountable rims---nickel mountings ---massive, straight-line body---big, roomy seats---electric lighting by generator---everything. DON'T JUMP ON THE CRANK

of a stiff engine—it won't do any good—and besides, it's dangerous.

Jump on the manufacturer instead, who induced you to buy a car not equipped with an

ELECTRIC CRANKER

It is reliable always, ready to crank your engine, stiff or otherwise, and do it promptly, too.

You'll have one on your new car, of course, but don't overlook the importance of the Storage Battery that's a part of every electric cranking system.

GLBA

STORAGE BATTERIES

are used in the great majority of such systems. Look for it and demand it, if necessary, with the Electric Cranker installed on the car you favor.

Write us for full information

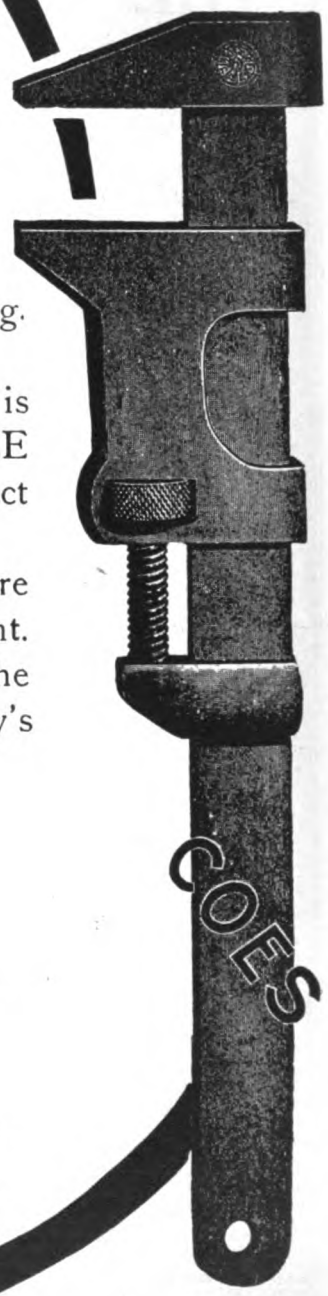
COES



THE
Wrench Supreme

Strength without bulk or clumsiness.
Ease of handling without slipping or bruising.
Perfect balance and right grip

Everything the motorist desires in a wrench is to be found in the "COES" AUTOMOBILE MODEL, and you will never know perfect wrench service until you pin your faith to it.

It stands to reason that the 5 per cent. more you pay for a "COES" wrench goes for 60 per cent. more quality and service—put this wrench in the tool kit and shop. You will get your money's worth.

MARMON

"The Easiest Riding Car In The World"

RACING VICTORIES:

ARE not proofs of speed for the buyer of the car. Stock cars with regular equipment cannot hope to equal the speed of the racing cars.

Racing does prove the strength and stability of design, materials and workmanship. It demonstrates dependability, economy of oil and fuel and ease on tires.

These demonstrations in racing to mean anything to the buyer must be backed up by the records of cars in service.

Every vital part of the Marmon has been proved capable by the winning of races—it has strengthened that demonstration by years of service.

Ask for the Marmon records in races backed by the records in the hands of owners.

Detailed Information on Request.

The Marmon "32"

A sensible, logical car—a car of moderate size and capacity, meeting every requirement for touring and city use, with the economy in tires, fuel and upkeep so important to the majority of motorists. Four-cylinder, 32-40-h. p., 120-inch wheel base, electric starting and lighting system, with body types to meet every requirement and corresponding equipment. Touring Car $3,000.

The Marmon "48"

Six-cylinder, 48-80-h. p., 145-inch wheel base—a large car with small car advantages, a car with short turning ability which eliminates the old objections to long wheel base—a car of wonderful and surpassing riding qualities; electric starting and lighting system, with body types to meet every requirement and corresponding equipment. Touring Car $5,000.

THE 8-DAY HIGH GRADE "CHELSEA" AUTO CLOCK

"SPECIAL"

"OFFSET"

"ROUND"

"LIMOUSINE"

Primarily intended for use inside the bodies of large enclosed cars, and for such use its case can be given a variety of fine finishes. It also makes an attractive clock for use on dashboards. Only made in 2¾-inch size.

The Justly CELEBRATED 8-Day, High-Grade "CHELSEA" AUTO CLOCK (*Trade-mark*)

NOW and for YEARS the RECOGNIZED STANDARD of EFFICIENCY

Clocks built with a view to stand the jars and jolts and rough riding of Automobiles. Reputation the highest. Used by parties demanding the BEST.

☞ ALL SIZES STATED ARE THE APPROXIMATE DIAMETERS OF THE DIALS.

All are 8-day High-Grade. All are in DUPLEX (patent applied for) polished cast brass cases, the most thoroughly waterproof case on the market. The "SPECIAL" clocks show dial on an angle; its inner cased clock, when removed from the outer (locked) case, is excellent for use on mantels, bureaus, etc., when touring; its outer case is screwed to dashboard by hidden screws. The "SPECIAL" clocks are in large demand from dealers for owners of finest cars.

The MOTOR CLOCK has the same clock movement which for years we have supplied for the hard use on Locomotives, Steam Fire Engines, etc.; its dial is of same appearance as the Auto Clock dial, but the Auto Clock movement has a somewhat finer train.

The 3½ MOTOR "OFFSET" is likely to prove a quick, ready seller. Very attractive.

Ask for our new Auto Clock Circular and Price List, dated Oct. 1, 1911, illustrating and pricing the above and three new models, C, D and E.

PRICE LIST (Per Clock)

		"Round"	"Offset"	"Special"	"Limousine"
"CHELSEA"	2¾-in. Auto Clock.....	$26 00	$28.00	$36.00	$28.50
	3½-in. Auto Clock.....	28.00	30.00	45.00	Only made in
	3½-in. Motor Clock.....	24.00	26.00	41.00	2¾-inch size

If wanted fitted with outside (patent applied for) stem-winding and stem-setting device—the best of its kind—**Add $3.00 to above Price Lists.** (Such device we do not apply to the "Motor" Clocks or "Special" Auto Clocks.)

For Use on AUTOMOBILES and MOTOR BOATS

You want the Best? Ask your DEALER for the "CHELSEA"

THE SEVENTH ANNUAL

TOURING NUMBER

.... OF ....

THE AUTOMOBILE JOURNAL

Will Be Issued July 10, 1913

Recognized as the most complete compilation of authoritative touring information published in one volume, this number will be bigger and better in every respect than ever before. The routings have been selected not only with a view to supplying detailed driving directions for both outward and return trips, but they have been so arranged as to cover the entire country, each itinerary connecting with all others. Special departments are devoted to separate sections, these comprising: New England, North Atlantic States, the South, the Middle West, the Far West and Canada. The transcontinental routings include four complete tours from the Atlantic to the Pacific, or vice versa, and the data supplied are sufficient to afford opportunity for visiting every part of the United States and Canada where practical motoring can be enjoyed.

In addition to the American routings, several European tours will be presented with the same attention to detail in every respect. Full information concerning the motoring laws of the several states and foreign countries also will be incorporated, as well as timely suggestions respecting the proper enjoyment of touring, including camp life, wearing apparel, etc. The mechanical side of touring is not forgotten, special articles having been prepared by experts in their respective fields, covering the preparation of the car, carburetion, ignition, tire care and all other details.

THE SEVENTH ANNUAL TOURING NUMBER, like all of its predecessors, will be preserved in the car and referred to constantly throughout the entire year—until the appearance of its successor. The manufacturer of cars, accessories or supplies, who desires that his product shall have permanent value in reaching the owner, will not neglect the opportunity for being represented in this number. Based upon the experience of the past, a specially large edition will be printed, anticipating the increasing demand, thus affording even wider distribution to all patrons.

The regular issue of THE AUTOMOBILE JOURNAL will be incorporated as well, all of the features and departments being retained in addition to the hundreds of tours and other touring information.

HENDERSON

New De Luxe $1785 Complete

The Year Ahead Car!

Wire Wheels (*Wood wheels optional*)
Left Drive *Logical method—up-to-date*
Center Control *On seat—like an electric*

Electric Lights *Controlled by one switch from seat*
Cowl Dash *Control button within easy reach*
Cowl Gasoline Tank *Positive power on hills—economy*

Electric Starter *Dynamo System—independent*
Long Stroke Motor *4⅛ x 5½ 44 h. p.—silent*
Oversize Tires *Wire wheel 34x4—Wood 35x4½*

Stylish Big Body—*more room front and rear*

Turkish upholstery—ebony finish woodwork.
Electric horn.
Imbedded clock and speedometer on cowl dash.
Special tailored top.
One-piece ventilated windshield.

High tension magneto—independent of electric starter.
German silver—honeycomb oversize radiator combined with Renault type of cooling.
Famous Stutz rear system, including transmission.

The Complete Henderson Line

Light Four $1585	De Luxe $1785	Six Cylinder $2285
5 Passenger Touring	5 Passenger Touring	5 Passenger Touring
Motor 4⅛ x 5¼	2 Passenger Roadster	2 Passenger Roadster
	Motor 4⅛ x 5½	Motor 3¾ x 5½

All of the same Henderson quality, difference in power and size. Coupe and Sedan furnished on De Luxe and 6 cylinder chassis

Important Note to Dealers

Just one year ago we made a similar announcement and we took the automobile trade by storm. The response was instantaneous—all without showing a car. The confidence in the Hendersons was manifest Everyone knew a car they produced would take foremost rank.

Now we are *ready* with the Henderson De Luxe, the "year ahead" car. Read the above specifications. Note how every wanted feature is there.

We are making shipments right *now*. Get into communication with us for our "square deal" Henderson agency proposition.

Write us today for complete information regarding the Henderson "square deal" agency arrangement. 26B

Which Road—the highway at a trifling toll or the by-way with its deadly risks? You're not the man to hesitate!

Nor can you debate long in choosing lubricants, when the same fear, the same certainty of wear and tear, attend the use of greases which save a few nickels when you buy.

You can afford to use

TRADE MARK REGISTERED IN

NON-FLUID OIL

UNITED STATES PATENT OFFICE

You can't afford not to—

Even at a little higher price per can, when you secure the smooth, open road to long life for your car and the satisfaction of mind-ease about your bearings.

Silent gears, a smooth flow of power from engine to wheels, long service from the costly ball and roller bearings; cool, uncomplaining universal joints and differential—these are the NON-FLUID OIL incentives, at perhaps a yearly toll of one dollar, *surely* at a yearly saving of $50 to $100 in bearings and repairs.

YOU'RE NOT THE MAN TO HESITATE!

Be sure you get genuine NON-FLUID OIL packed in orange colored cans bearing above trade-mark.

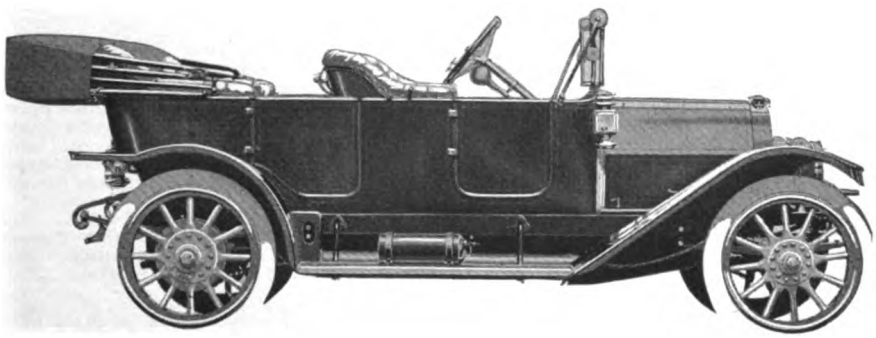
THE Overland factories have the largest drop forge plant in the industry. This means that we depend on no outside source for our drop forgings.



When a certain construction needs a drop forging we can go ahead and make it—at minimum cost. Parts which cost others $9 each, we make for $3.

Thus you can see why we can do what others cannot do. The value described above is the result.

Catalogue on Request. Please address Dept. 52.

10 Books 800 Pages of Text 1500 Illustrations

Automobile Owners Automobile Repairmen Students
Automobile Drivers Automobile Dealers Engineers

Each book has been thoroughly revised and its contents have been brought right up to the minute. The subjects have been treated in a simple, non-technical manner, making the discussions as valuable to the novice as the engineer. Eighty per cent. of the automobile and technical schools in the United States and Canada use these works as text books, and more than 500,000 copies are sold annually. No similar expositions are to be compared with them—regardless of price. Every car owner and operator should have the full set.

Knowledge of your car means additional pleasure in its use and decreased cost in operation and maintenance. The practical instruction that you need is to be found in these books, and to acquire the same fund of information in any other manner would require years of constant study. You must understand your motor if you would adjust or repair it. The subject is fully treated in the Engine book. This applies as well to the Magneto, Carburetor, Battery, Lighting, Chassis and Tire books. When overhauling and rebuilding, read that discussion. The book on Motor Car Operation covers that subject with reference to all cars. No matter what the need, there is a book to meet it. No car or component is neglected, and all standard engines, magnetos, carburetors, batteries, lighting systems and vehicles are dealt with. The full set includes:

Engine	$ .35	Motor Car Tires	$ .25	Magneto	$ .35
Carburetor	.35	The Motor Car Chassis	.25	Motor Car Operation	.50
Lighting by Electricity	.50	Motorcycle Construction, Care and Repair	.35	Overhauling, Rebuilding and Repairing	.50
Battery	.35

Pleasure and Commercial Car Specifications

We are publishing separately and in book form detailed mechanical specifications of all makes and models of pleasure and commercial vehicles. Every day in the year you have use for such mechanical information. You are constantly asking for constructional facts in connection with different makes of cars and as constantly confronted by similar questions from hundreds of other owners. With these forms in your possession you can learn in a moment any mechanical detail you wish to know.

with the very highest-priced 1913 cars and you will realize why we claim to offer you the greatest value on the market today.

Long stroke (4⅞x6) flexible and noiseless motor with enclosed valves. Left side drive. Center control. Gray & Davis electric starter. Gray & Davis dynamo electric lighting system. Bosch double dual magneto. Multiple jet carburetor. 12-inch Turkish upholstery. Full heavy nickel trimmings. Adequate baggage carrying compartment concealed in body, but easily accessible. Powerful and Reliable Brakes. Spacious interior. Tire pump integral part of the motor. 128-inch wheelbase. Adjustable ventilating and rain vision windshield. Hoffecker steady hand speedometer. Electric horn. Tire carrier in rear. Silk mohair top, cover, curtains. Full floating rear axle. Resilient springs; ¾ elliptic in rear, semi-elliptic in front. Large gasoline pressure feed tank, with gauge in rear. Robe rail, foot rest and foot mat in running board. Plain, continuous enclosed metal guards. Easy riding qualities unexcelled. Oiling system demonstrated to be perfect. Truffault-Hartford shock absorber.

National Breaks Another Record

The *National* has won still another race—a race for a *sales record*—and you, the public, sat at the wheel and filled the judge's stand.

All previous sales records have been smashed by the *National*. Its factories are today doing the greatest business in their 13 years of successful manufacturing. Not a mushroom growth, if you please—but the result of appreciation—merit appreciation of the buying public as well as the dealer.

Here is a car that is *built* right—no other car sold at *any* price contains any better materials. That's why the *National* buyer stays contented—why *National* dealers lead today in the race for *sales*.

If you are in the market for an absolutely dependable motor car at the right price—if you are a dealer looking for a real "sales leader"—just write us now—today.

VOL. XXXV, No. 8 MAY 25, 1913 Price, $1.00 the Year

THE NEED FOR NATIONAL HIGHWAYS.

A Plea for a System of Good Roads Built and Maintained by the United States Government---Why the Plan Is Feasible and What It Will Accomplish.

(By Charles Henry Davis, C. E.)

THERE are over 1,000,000 automobiles in the United States. There are 92,000,000 people and 20,000,000 families. This means an average of one automobile to every 92 people, or every 20 families. While the pleasure vehicle has had a phenomenal growth, it is as nothing to what the motor truck is destined to accomplish, but this will be retarded instead of accentuated unless road building receives a decided impetus. And what greater impetus can there be than a system of national highways that shall be built and maintained by the United States government?

Good Roads—Good Schools—Knowledge—Prosperity.

Such a system will bring about the construction of more state highways to connect therewith. It will increase appropriations therefor, and extend the county and town roads as feeders to the trunk lines. Good roads will increase the radius of motor truck traffic; department stores will make their deliveries free at distances not now attempted and the distribution of wholesalers direct to consumers will be effected by the same means. Pleasure car traffic, local and long distance, will be increased beyond the bounds of present belief.

There are about 300,000 proprietors of manufacturing and mining establishments, and these have about 800,000 salaried employees. There are, likewise, about 6,400,000 farmers. This makes a total of 7,500,000 persons who some day will have automobiles as they now have buggies or wagons. In addition, there are

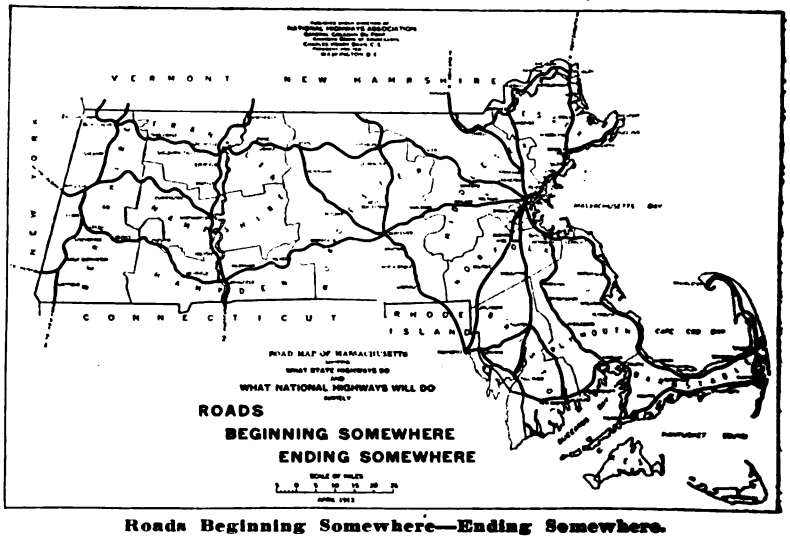
Digitized by Google

Poor Roads—Poor Schools—Ignorance—Poverty.

about 7,700,000 wage earners in the above establishments, some considerable number of whom eventually will have a small cheap car, such as will shortly be produced. There surely is an enormous business ahead of this industry.

During all ages it has been of primary importance to provide a people with means for intercommunication. People, like water, must move or stagnate. They must run and play like the brook itself or become sluggish and dull—to themselves as well as to others. Of the seven modes of intercommunication—water, roads, postal, railroad, telegraph, telephone and wireless—only one, roads, is free to all the people of the earth. Roads are the most universally used and are, therefore, the most beneficial to the greatest number of people.

The railroads of the United States now carry approximately 1,000,000,000 passengers a year. This means that if every inhabitant rides his proportionate number of times each individual takes only 10 trips one way each year. As he must return, this means only five round trips—or only five days out of every 365—that he travels each year. Probably not 50 per cent. of the population travels on railroads at all.



But how about roads? There is scarcely a man, woman or child who does not pass over or along a road or street, not only every day, but several times a day. If each such passage were considered a trip, as on railroads, the passenger traffic on the highways probably would reach a figure something greater than 200,000,000,000, or 200 times the traffic on steam railroads. Furthermore, nearly 100 per cent. of the population travels—or would if they were passable—every day of the year on or along the highways, while probably not to exceed 50 per cent ever ride on a railroad train at all.

The railroads of the United States approximate 250,000 miles in length. They have cost about $25,000,000,000, or an average of $100,000 a mile. Of this vast sum the United States government has furnished more than $1,000,000,000, or four per cent. of their present cost. At the time of such appropriation this amount was more nearly 20 per cent. of their then cost.

These railroads have been operated at a profit by and for a few favored individuals, and to which the entire community contributes to the extent of $3,000,000,000 a year in gross receipts, one-third of this, or $1,000,000,000, being profit to the security holders. These are estimated not to exceed 500,000 favored individuals, or not more than one-half of one per cent. of total population.

On the other hand, the highways of the United States have a mileage of about 2,300,000, or nearly 10 times the length of the steam railroads. But they carry 200 times, or more, the passenger traffic of the railroads. The average density of passenger traffic is therefore more than 20 times greater on the highway than on the railroads.

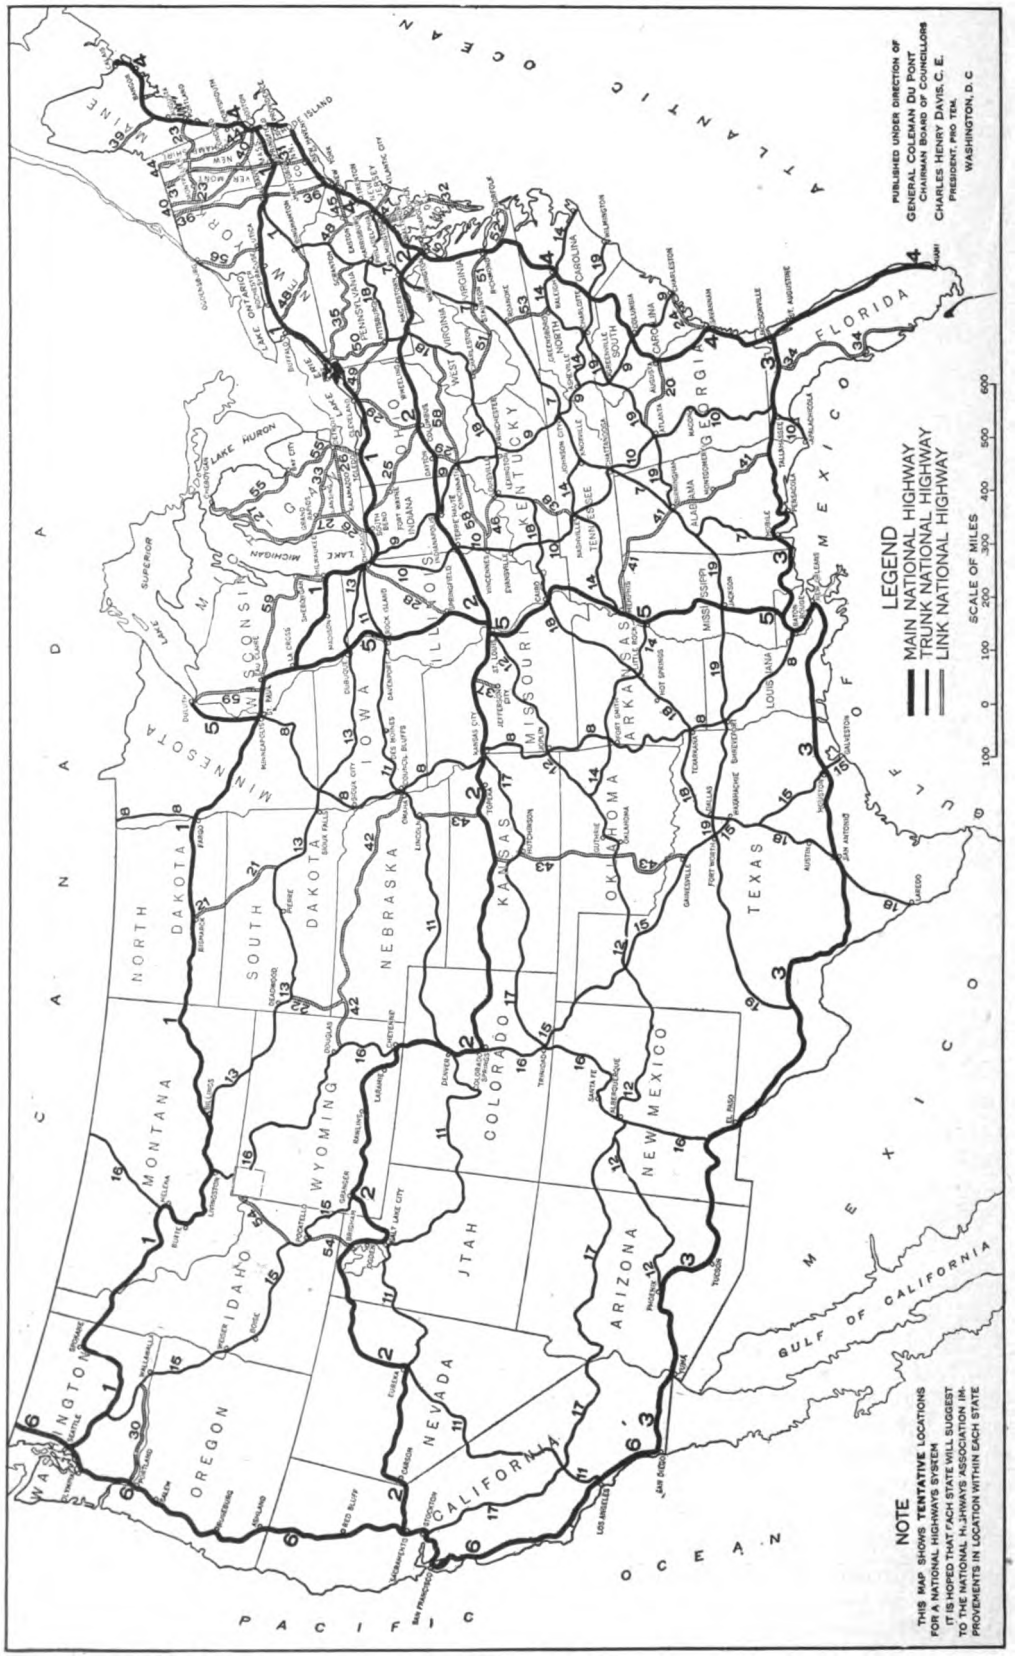
The steam railroads carry nearly 2,000,000,000 tons of freight a year. Probably more than 60

Roads Beginning Somewhere—Ending Somewhere.

Digitized by Google

per cent. of this goes over highways to reach the railroads. Probably more than 80 per cent. again passes over the highways to reach its destination from the point of railroad delivery. Probably more than 50 per cent. must again be transported over the highways to the consumer. It is conservative to say that 50 per cent. more tonnage exists in the raw state prior to reaching any railroad where it can be considered in the state of net tonnage. On the above basis there is a tonnage passing over the highways amounting to something over 5,000,000,000 tons. But how about the increases caused by manufacturing processes; by hauling back and forth; delivery and redelivery of the same article in bulk as it is divided and sub-divided and again redivided in manufacturing specialization? And how about the tonnage passing over the roads which never reaches the railroads? No one can tell exactly. It is possible only to make a guess, but surely it is several times the total as given above. Shall it be believed to be 10, 15 or 20, or more billions of tons? It does not much matter, because it is evident that the highway freight traffic is many times that which passes over the railroads.

It is possible to build a system of national highways not to exceed 50,000 miles, which shall be so located as to serve more than 50 per cent. of the entire population. It would not exceed two per cent. of the entire highway mileage of the United States and therefore, if improved, would not cost more than two per cent. of the total for improving all the roads of the nation. But the United States government has paid four per cent. of the present cost (equal to 20 per cent. of cost at the time of the appropriation) of the steam railroads for the benefit of not to exceed 500,000 of the people, who gain a profit from the rest of $1,000,000,000 a year. In the face of such facts can anyone advance a sound argument against the national government building and maintaining such a system of national highways? They will be used by all. They will be paid for by everyone. They will be free to all. They will be of untold daily advantage to each. If it were wise for the government to help build railroads for the benefit of a few, how much wiser to build national highways for the benefit of all!



Fifty thousand miles of national highways at $20,000 a mile would make them cost $1,000,000,000, a sum which does not exceed the amount spent by the government on the steam railroads, which are privately owned—not publicly owned, as would be these national highways. It is estimated that more than 90 per cent. of highway traffic is confined to less than 20 per cent. of their length. If true—and it is in substance—then such a system of national highways would today carry by far the bulk of the traffic now passing over the entire system of highways.

Fifty thousand miles of national highways will increase the value of adjacent lands within one mile thereof by more than $600,000,000, or more than half of their estimated cost. If 50 per cent. of the population produces and handles its proportion of tonnage (as a matter of fact, it is much greater), then much more than 2,500,000,000 tons would move over such a system of highways. If only 10 cents a ton were saved in hauling charges (a ridiculously small estimate of saving) due to the improvement of these highways, then more than $200,000,000 a year will accrue to the benefit of the people of the United States. This allows interest at five per cent. a year on the investment in such highways. This saving will pay for these highways in five years. And yet there are some legislators who say, "The na-

Why Living Is Costly.

tion cannot afford to build national highways!"

There are more than 27,000,000 horses and mules in the United States; more than 4,000,000 horse drawn vehicles; more than 2,000,000 bicycles; more than 100,000 motorcycles, and more than 1,000,000 automobiles. These are valued at more than $5,000,000,000. Again, if 50 per cent. of this traffic passed over such a system of national highways and, due to their improvement, there was a saving in depreciation of only 10 per cent. the gross amount so saved a year would be $250,000,000. This would pay for such a system of national highways in five years. With such facts before one, what is the inevitable thought when considering the hesitation and uncertainty displayed by law makers in their treatment of this, the most important subject before the nation?

There are 18,000,000 children who endeavor to attend school. There are over 30,000,000 who should attend school. Why don't they? Obviously, because the schools are not provided or attendance required. Why not? Largely because during much of the school term a considerable portion of 2,000,000 miles of roads is impassable. This is shown by the fact that only .9 of one per cent. of the urban white population of the United States of native white parentage is illiterate, while rural illiteracy is 600 per cent. greater in the same class of inhabitants. How is it possible to have or obtain good schools in the rural districts if there are not good roads to reach them at all times and in all seasons?

The relation of good and bad roads to illiteracy is indicated by the table above. This tabulation does not, of course, include foreign born, native born of foreign parentage, or negroes, all of which are excluded for obvious reasons. The

Table Showing Relation of Good and Bad Roads to Illiteracy in Several States.	Total Population: Native Whites of Native Parentage (1910)	Per Cent. Improved Roads (1909)	Per Cent. of Illiterate Native Whites of Native Parentage (1910): Total	Urban	Rural

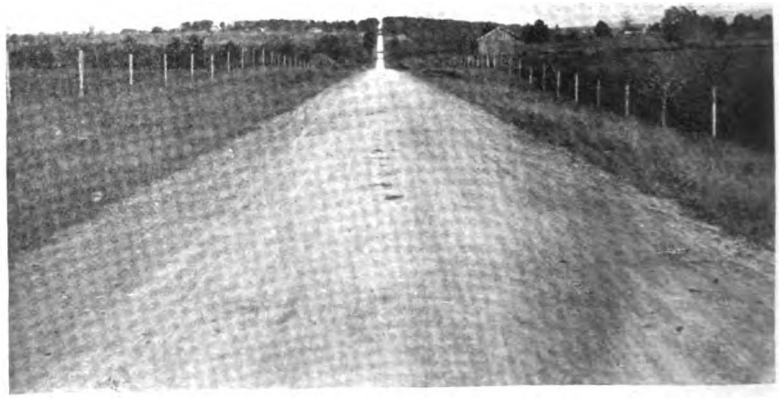
How to Cut Down the Cost.

Digitized by Google

Small Road Tax—No Saving.

children of today are the electors of tomorrow. The population is increasing by leaps and bounds. If education means liberty, and if poor roads mean illiteracy or worse, has the country the right not to build roads, even if they would not pay for themselves well within the generation which builds them?

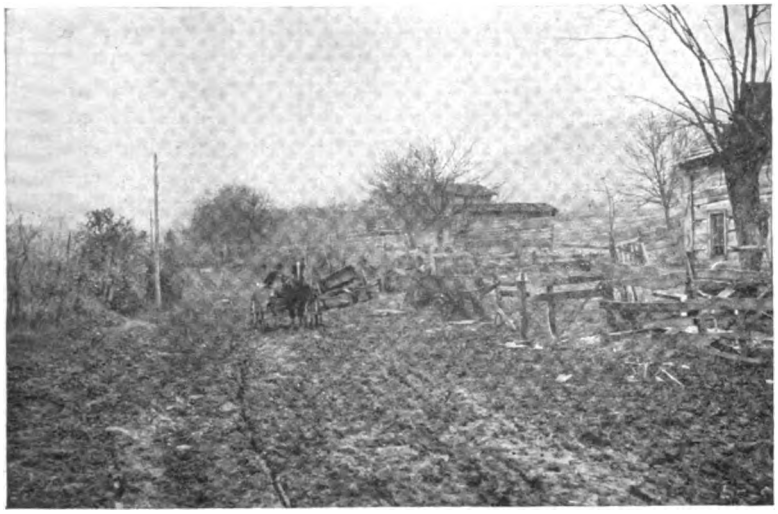
It is believed that the foregoing facts and the arguments based upon them are unanswerable by those who may be opposed to the national government participating in road building. But how is the desired end to be gained?



Agitation is desirable and wise. Road associations of various kinds and in various places are both necessary and desirable. The more the better, and the more effective their activities. But this is not enough. To get concrete action they must unite on some plan that can be supported loyally. Otherwise, Congress will not act, or will adopt some plan calculated eventually to retard road building, rather than accentuate it. In fact, Congress already has taken one step in the wrong direction to the extent of $500,000.

To those who know, federal aid is but a repetition of the errors of state aid, long since abandoned by those states which have best developed their highways. On the other hand, national highways, built and maintained by the national government, are but an extension of the present relationship between the states and their counties and towns where state highways are built.

The annual appropriations by Congress now approach $1,000,000,000, approximately distributed as in the table below. How absurd to liberty loving, peace loving Americans to spend any such amount on war—past, present and to come—and refuse to spend one-tenth thereof ($50,000,000) a year in giving the nation a road system that will be a benefit far outstripping any other within the knowledge of mankind! Such appropriations would build a system of 50,000 miles of national highways in 20 years. Such a system would encourage and accentuate the building of good roads everywhere by states, counties, cities, townships and towns, and these roads will act as the collecting and distributing medium of the national highways.



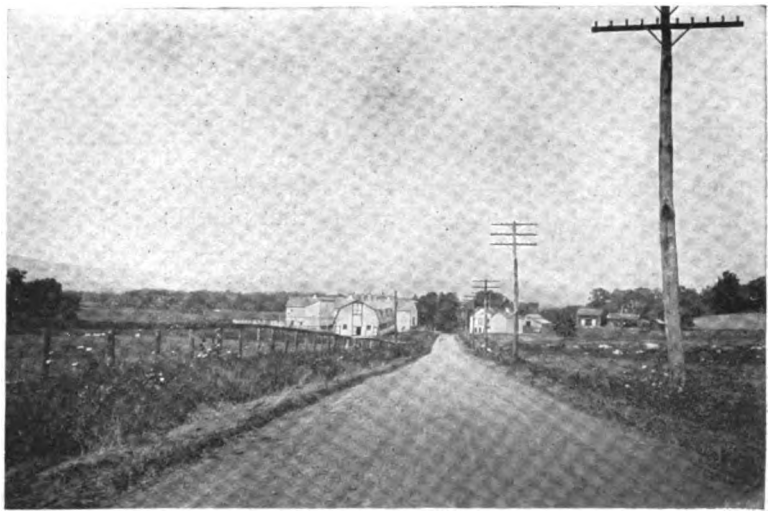
1. WAR—past, present and to come	420 millions	=	42% of total
2. POSTAL SERVICE	230 millions	=	23% of total
3. GOVERNMENT — legislative, executive, foreign, customs, immigration, interest on public debt, etc.	200 millions	=	20% of total
4. PUBLIC WORKS—buildings, rivers, harbors, reclamation, forestry, public lands, Panama Canal, etc.	110 millions	=	11% of total
5. EDUCATIONAL AND STATISTICS — census, public printing, agriculture, surveys, public health and life, etc.	40 millions	=	4% of total
Totals	1000 millions	=	100% of total

"What's in a name?" Everything, or almost

Fair Road Tax—No Losses.

Digitized by Google

Poor Roads—Sterile Farms—Worthless Lands.



everything. "Give a dog a bad name and it sticks to him." It is the same with roads. They are now laboring under that infernally confusing, false and misleading epithet, "Federal Aid." It is responsible for delay in congressional action. It is responsible for the differences of opinion, on the part of the body politic, as to the wise plan to advocate. It sounds well. It can be made to mean anything that suits the desires of the user. Look at the two maps! Look at the illustrations! In looking, does the country want to have "Roads Beginning Nowhere, Ending Nowhere?" It is unthinkable.

If an appropriation is demanded by its advocates for any particular highway, the advocates of another advance their claims. Failure to agree on which shall be built first prevents action. But if a system of national highways is agreed upon, everyone will be willing to leave when, where and how to a national highways commission.

No plan should be determined upon until after a most thorough investigation and report on the part of a properly constituted commission with an appropriation sufficient to not only do the work, but to give adequate publicity thereto. Such publicity will not only crystallize public opinion, but likewise guide the commission itself in arriving at a wise conclusion.

Substantially no great government work has been undertaken, or large appropriation made therefor, without a careful preliminary investigation and report to Congress thus enabling it to act wisely and with discretion. Why should the building of a system of national highways—the greatest and most important of all—be undertaken with little or no knowledge before Congress of the subject or its needs? The magnitude of the project is such, and many of its aspects are so technical, that it cannot properly be considered in the first instance by a congressional committee; and to refer it to one of the regularly constituted executive departments would unduly burden such department and interfere with routine work, even assuming it was qualified. The wisest course would seem to be the creation of a special national highways commission to investigate the entire subject and report to Congress at the earliest practicable date. Such has been the course pursued with all great public works, including the Panama Canal.

Why should not this be done for highways before the nation is committed to either a system of national highways, or federal aid, so-called? If national highways, it should be known: Where? How long? How wide? How built? What material? At what cost? What proportionate traffic will they carry? What will it cost to maintain them? How much will they reduce the cost of transportation? How much will they increase land and other investment values? Can such investigation and a wise determination be arrived at except by the efforts of an expert commission? It is believed that they can not.

Good Roads—Productive Farms—Valuable Lands.

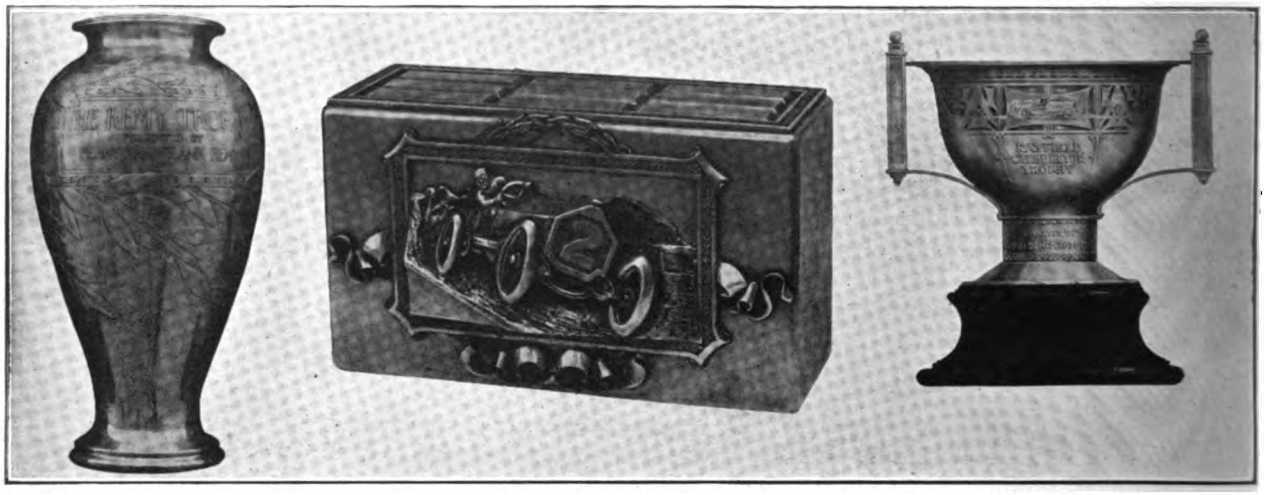
THIRD INTERNATIONAL SWEEPSTAKES RACE.



WHEN Joseph Dawson in a National car completed the last lap of the second 500-mile International Sweepstakes race on the Indianapolis motor speedway, Memorial Day, 1911, he not only won the international championship, but he set new world's records for 400 and 500 miles. The car and driver which finishes the third event May 30 will be declared international champion, regardless of whether or not the marks set by Dawson and the National are exceeded. The National took the title from the Marmon, which was driven to first place in the initial 500-mile contest, Memorial Day, 1911, by Ray Harroun.

Harroun's Marmon covered the 500 miles in 6:42:08, or at an average speed of 74.59 miles an hour. Dawson's National lowered the first figure to 6:21:06, the second being increased to 78:72. As an indication of Dawson's consistent driving, reference may be had to the following table, giving the time for each 20-mile period throughout the race (To find the elapsed time at any point add the various times to that point):

Miles	Time	Miles	Time	Miles	Time
20	14:55	200	18:10	360	17:36
40	14:50	220	16:18	380	14:19
60	14:47	240	14:32	400	14:30
80	14:51	260	14:31	420	14:32
100	15:01	280	17:59	440	17:31
120	14:51	300	14:31	460	15:22
140	14:33	320	14:24	480	15:12
160	14:33	340	14:35	500	14:15
180	14:28				

This year's event will be international in every sense of the word. Heretofore, foreign cars have competed, but with American drivers. This year, not only are there foreign machines which have not been seen in an American contest before, but several of the drivers are foreign as well—some of them unable to speak the English language. Among the latter may be mentioned Jules Goux and Albert Guyot of France, Zucarrelli and Trucco of Italy, and Pilette of Belgium. The cars that are new in this country include an English Sunbeam and two French Peugeots. No less than two machines, a Mercedes and a specially reconstructed Stearns, will use Knight sliding sleeve motors.

Thirty-one cars have been entered, and this list may be reduced slightly as a result of the preliminary trials. But 30 cars will be permitted to start, and only those capable of showing an average speed of 75 miles an hour are eligible. The entry list comprises the following:

At Left, Remy Grand Trophy; Centre, Prest-O-Lite Award; at Right, New Rayfield Punch Bowl.

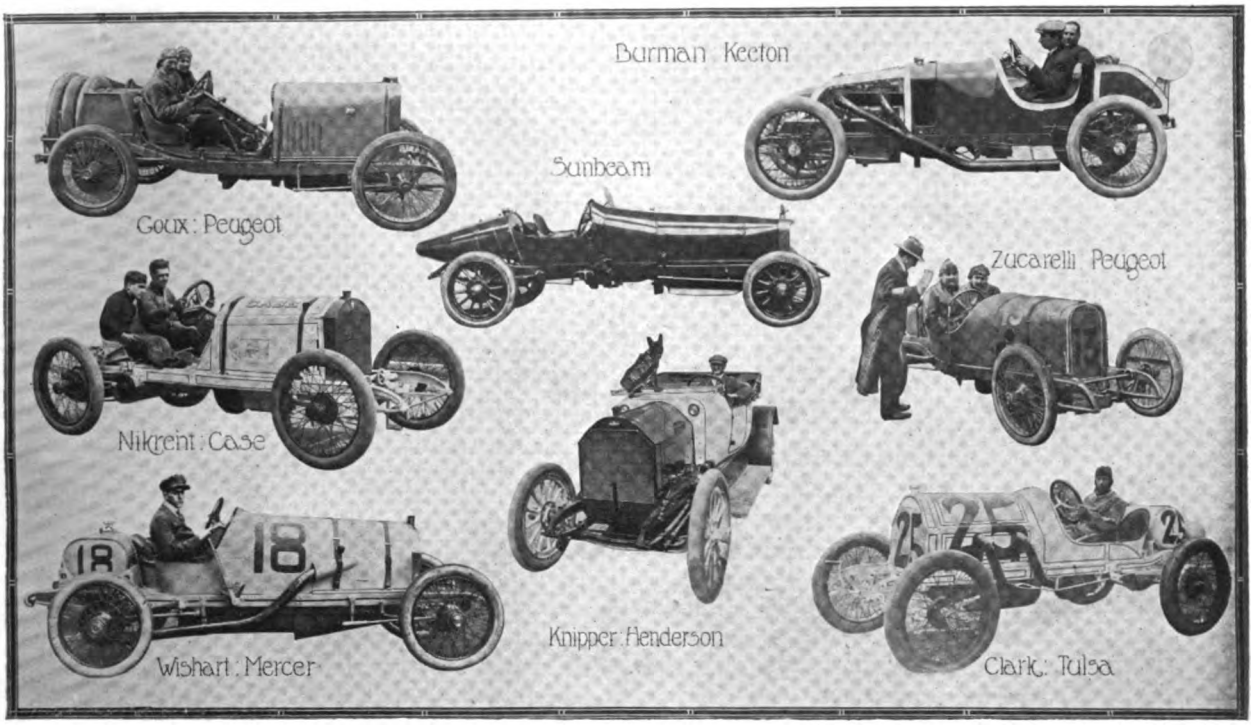
Stutz, Anderson; Stutz, Merz; Nyberg, H. Endicott; Keeton, Burman; Mason, Evans; Mason, Tower; Unknown, ———; Stutz, Herr; Sunbeam, Guyot; Henderson, Knipper; Fox Special, Wilcox; Smada, Adams; Peugeot, Goux; Peugeot, Zucarrelli; Amel, Liesaw; Schacht, Jenkins; Mercer, DePalma; Mercer, Bragg; Mercer, Wishart; Mercedes-Knight, Pilette; Pennebaker-Stearns-Knight, Pennebaker; Tulsa, Clark; Mercedes, Mulford; Isotta-Fraschini, Grant; Isotta-Fraschini, Tetzlaff; Isotta-Fraschini, Trucco; Case, Disbrow; Case, W. Endicott; Case, J. Nikrent; Unknown, ———; Mason special, Haupt.

The Indianapolis track is one of the best known in the world. The course is 2.5 miles long, and the surface is of vitrified brick. A cement wall, three feet high and 11 inches thick extends around the outer edges of the turns. All stands are protected by a heavy wire fence of wide mesh. During the race the course will be patrolled by a special organization of 350 men

Digitized by Google

under the command of Capt. W. P. Carpenter, I. N. G.

The speedway management has posted a purse of $50,000, divided as follows: First prize, $20,000; second, $10,000; third, $5000; fourth, $3500; fifth, $3000; sixth, $2200; seventh, $1800; eighth, $1600; ninth, $1500; 10th, $1400. In addition, the Bosch Magneto Company, maker of Bosch magnetos and plugs; Hartford Suspension Company, maker of Truffault-Hartford shock absorbers, and Emil Grossman, maker of Red Head spark plugs, offer special cash awards for certain place cars, conditional upon the use of their equipment. The Findeisen & Kropf Manufacturing Company, maker of Rayfield carburetors, has donated a handsome gold and silver punch bowl, valued at $1000, and $1000 in cash, for the winner, provided the car uses its make of carburetor. To the leader at 200 miles, the Remy grand trophy and Remy grand brassard, the latter carrying a salary of $50 a week, will be awarded by the Remy Electric Company, conditional upon the use of Remy ignition. The Prest-O-Lite trophy, a solid silver brick with a replica of the speedway in bas relief on its obverse, will go to the car which is ahead at the end of 300 miles. The Wheeler-Schebler trophy, a heroic cup of silver, valued at more than $10,000, will go to the driver leading at 400 miles, and $1000 in gold will accompany it if the car is using a Schebler carburetor. It will be seen that the inducements are many and well distributed.



As a further indication of the importance of this year's event, may be cited the fact that the visiting members of the Institute of Automobile Engineers of Great Britain will be the official guests of the speedway during the race. Another distinguished guest will be Charles Faroux, editor of La Vie Automobile of Paris, France, who accompanies the Peugeot team. A special entertainment programme has been arranged for the evening preceding the race.

The officials of the meet are:

President, C. G. Fisher; vice president, A. C. Newby; second vice president, F. H. Wheeler; secretary-treasurer, J. A. Allison; director of contest, C. W. Sedwick; auditor, T. E. Myers; director of public safety, Capt. W. P. Carpenter; general press director, Paul R. Martin; chairman contest board, William Schimpf; representative contest board, David Beecroft; honorary referee, Larens Enos.

Referee, A. R. Pardington; chairman technical committee, F. E. Edwards; starter, Charles P. Root; director of timers, Joseph Frisby; director of scorers, John Cox; scorers, Ellis Hunter, Will J. Dobyns; judges, Howard Marmon, H. B. Joy, Henry Ford, Roy Chapin, F. A. Seiberling, H. S. Firestone, Howard Coffin, J. N. Willys, W. H. Brown, Thomas Hay, J. L. Gavin, C. A. Pfeffer, George M. Dixon; umpires, George Weidley, Harry Hammond.

Announcing director, John P. Dods; director of signals, J. A. Barclay; clerk of course, Carl Walerick; assistants to contest director, Homer McKee, W. L. Esterly, T. B. Shoemaker; assistant starter, John G. DeLong; assistant technical committee, B. Salzgaber, Henry Law, Chester Ricker, Harry Vissering; assistant scorer, A. S. Heiskell; chairman press reception, H. C. Bradfield; surgical director, Dr. Frank R. Allen; superintendent of gates and roads, Frank L. Moore; paddock manager, W. S. Gilbreath; superintendent, E. B. Pierce.

A Few of the Machines Which Will Compete in the Third Annual International 500-Mile Sweepstake Race.

Digitized by Google

WHO IS WHO AMONG THE DRIVERS

George H. Clark—Tulsa.

Although connected with racing for some years, Clark came into prominence while driving a Mercedes car at the Galveston beach races of August, 1912. He formerly was with the Cutting team, driving in many western meets with Burman and others. He also drove Mercedes cars in last year's Elgin, Vanderbilt and Grand Prize events.

Albert Guyot—Sunbeam.

Guyot is one of the best known racing drivers in France, where he has finished a winner in a number of events of importance. This is his first appearance in America.

Joseph Nikrent—Case.

While his brother Louis was better known in the industry previous to 1912, Joseph Nikrent has gained an enviable reputation since he first came into national prominence while driving a Marmon in California races in 1911. Last year he drove a Case, winning third place in a number of victories for the year.

Paul Zucarrelli—Peugeot.

Zucarrelli is an Italian, but has been driving French cars for years. Both he and Goux have driven together in many of the important races in Europe, including the French Grand Prix, and Zucarrelli has returned a winner several times.

Jules Goux—Peugeot.

While Burman still holds the world's record for speed, Jules Goux of France recently created a new world's record with his Indianapolis Peugeot on the Brooklands track, when he covered 106 miles, 307 yards in an hour. Burman's speed was 141.73 miles an hour, but for only a single mile. Goux and the Peugeot have a long list of victories to their credit, including the 1912 Sarthe Grand Prix, and others almost as important in Europe.

Ralph Mulford—Mercedes.

Mulford is best known as the winner of the Vanderbilt cup in 1911, in which event he drove a Lozier, although with a car of this make he won the Elgin National trophy in 1910, and created numerous 24-hour records. His first race was on the Point Breeze track in Philadelphia in 1907, this being a 24-hour event. In 1908, he set a new 24-hour record and three weeks later finished in second place in another event of this character, lowering his former time. Last year he drove a Knox.

Louis Disbrow—Case.

Disbrow finished the racing seasons of 1911 and 1912 in second place, considering the list of victories. He has been racing for seven years, his first mount being a Pope-Hartford, which he designed and built himself. Most of his driving, until within the past two years, has been in cars of this make, although he has created a number of hill climbing records in the Knox.

Howard Wilcox—Fox Special.

Wilcox is best known as one of the National racing team in 1911, helping to place cars of that make in the first rank among winners that year. He also has an enviable record as a driver in hill climbing events. He holds the stock chassis record for a mile, having covered the distance in a National car in 0:40.32, and the five-mile beach championship also in a National.

William Endicott—Case.

William Endicott retired from racing at the end of 1910 and bought a farm. He was the first racing driver of the Cole Motor Car Company, and when he learned that this concern was not to be represented in the first 500-mile race, he returned to the track for that event. Previously he had won a number of events with Cole cars, including that for the Massapequa Sweepstakes trophy. Last year he drove a Schacht.

Harry Grant—Isotta-Fraschini.

Few men in America are better known than Grant, chiefly because of his having won the Vanderbilt cup two years in succession with an Alco car. He made his racing debut with a car of this make at Readville, Mass., in 1907. His Vanderbilt victories of 1909 and 1910 brought him into international prominence, and his style of driving—consistent from the beginning to the end of the race—has been adopted by a large number of drivers since that time. He retired from racing in 1911, although last year he was seen at the wheel of a Stutz in a few events in New England.

William Knipper—Henderson.

This will be Knipper's third appearance in a 500-mile race on the Indianapolis speedway, although in 1911 he was relief driver for Burman and in 1912 he acted in the same capacity for the Stutz team. He has driven in races all over the country, but is better known as a driver in long distance endurance trials and as a pathfinding driver.

F. L. Adams—Smada.

Adams has the distinction of being the youngest racing driver in America. The machine he will drive in this event was designed by himself, and it will be noted that its name is that of the driver spelled backward. This is his first race of prominence.

William Liesaw—Amel.

Liesaw is the tallest driver registered by the American Automobile Association, being six feet high. He is a college graduate and a mechanical engineer by profession, but since 1906 has been driving in races in a limited way. Last year he drove a Marquette-Buick in this event, and this year his mount will be a special machine built at Battle Creek, Mich.

Caleb Bragg—Mercer.

Bragg's most notable victory was with a Fiat in the Grand Prize race of 1912. He was an amateur until 1910, and soon after turning professional he astonished the spectators at one of the Brighton Beach races by piloting his car back onto the track after it had crashed through a fence. In last year's 500-mile race he acted as relief driver for Tetzlaff.

Digitized by Google

IN THE INDIANAPOLIS 500-MILE RACE.

Spencer Wishart—Mercer.

Wishart is known as a millionaire driver, and until last year he always was seen at the wheel of his own cars, these being machines of foreign make. He acted as relief driver for DePalma in the 500-mile event, and later went with the Mercer, creating new world's dirt track records at Columbus, O.

Gilbert Anderson—Stutz.

The first Stutz car was designed for the first 500-mile race, and Gilbert Anderson drove it the entire distance without stopping. He has driven Stutz cars ever since, and with splendid credit to himself and the maker of these machines. Anderson is a Norwegian by birth. He began his racing career in 1909, when for about 50 miles he lay on the hood of a Marion car, driven by Monsen, adjusting a carburetor.

Harry Endicott—Nyberg.

Harry Endicott has been driving cars since 1904, when he first appeared on the Harlem race track in Chicago. Unlike his brother, he has been something of a free lance, changing from one make of car to another with some little frequency. During the past two years he has been a consistent winner, finishing a victor in a Mason car in the race for the Wisconsin trophy at Milwaukee last fall.

Robert Burman—Keeton.

Besides holding the world's speed record, for which he was crowned the "Speed King" just before the 500-mile race of 1911, Burman has a list of victories to his credit which would fill a small volume. He stood at the head of the list of winners last year. His world's record was made in the "Blitzen" Benz.

Donald Herr—Stutz.

Herr was one of the members of the victorious National team in 1911, and last year went with the Stutz team. His most notable victory was in the race for the Illinois trophy in 1911. He began his career as a car tester and entered the racing field incidental to his other duties. For some 90 miles he relieved Dawson in the winning National in last year's 500-mile event.

John Jenkins—Schacht.

Jenkins began racing as a teammate of Venus, a noted Italian driver, in Europe several years ago. Subsequently he became a pugilist, and it was while on the Pacific Coast early in 1911 that he returned to this field, taking part in a 24-hour event. The Cole Motor Car Company secured him as a member of its team, where he did good work. Among his best known victories was the race for the Hamilton trophy in Cincinnati in 1911.

Charles Merz—Stutz.

While still a boy in short trousers Merz had his first experience at the wheel of a National racing car in Indianapolis, Nov. 4, 1905. The machine crashed through a fence and was badly smashed, but within two weeks Merz was back at the wheel of a National, alternating with Clemens in a 24-hour race, in which new records were created from 650 miles to 24 hours. Since that time he has been a consistent winner, until last year with National cars. He won the Illinois trophy in 1912 with a Stutz.

Ralph DePalma—Mercer.

In last year's 500-mile race DePalma was at the wheel of a Mercedes car, which failed him on the next to the last lap. A similar experience befell him on the last lap in the Grand Prize event, when he was taken to the hospital with what was expected to prove to be fatal injuries. He won the Vanderbilt cup, the Elgin National trophy, the Jepson cup and the Elgin free-for-all in 1912.

Teddy Tetzlaff—Isotta-Fraschini.

Tetzlaff is another California boy. He came into prominence by winning the Santa Monica road race in 1910 with a Lozier, creating a new American road race record. He was less fortunate in 1911, but last year he finished the Santa Monica race in a Fiat with a new world's road racing record. He also took the 200 and 250-mile events at Tacoma, Wash., and finished the 500-mile race in second place, with the same machine.

Robert Pennebaker—Pennebaker.

Pennebaker has had no track experience, although he has driven cars on the road for a number of years and is reputed to be an expert driver, cool headed and scientific. He is a wealthy garage owner in Memphis, Tenn., and his car is a rebuilt Stearns-Knight.

T. Pilette—Mercedes-Knight.

Pilette is a Belgian driver of some little prominence, although he has not been seen on this side. The car he will drive was built especially for this race and has a Knight motor.

Robert Evans—Mason.

Evans and Tower have been teammates for a number of years. Early in 1911 Evans won a one-hour race at New Orleans in a Warren-Detroit. He assisted Tower in a Jackson in the first 500-mile race, and in the fall of 1911 he finished in second place with an E-M-F in the race for the Tiedeman trophy at Savannah, when three E-M-F cars finished in one, two, three order. Last year he drove a Flanders.

Jack Tower—Mason.

Tower began racing in 1901, but it was not until 1907 that he came into prominence. After Heath won the first Vanderbilt Cup race, his Panhard was sold to Edward Hearne. Tower was given the job of rebuilding it, after which he drove it in a number of races in the middle west. He has driven the Buick, Jackson, Warren-Detroit, E-M-F and Flanders.

Harry Haupt—Mason Special.

Haupt has been devoting his attention to the sales end of the industry during the past few years, although he formerly was one of the country's best drivers.

Vincenzo Trucco—Isotta-Fraschini.

Trucco is an Italian driver with a long record in Europe. He is understood to represent the Isotta-Fraschini factory in the race.

AMERICAN VISIT OF BRITISH ENGINEERS.

SOME 30 members of the Institution of Automobile Engineers and the Society of Motor Manufacturers & Traders of Great Britain and

The Two Presidents: Howard Marmon, S. A. E.; T. B. Browne, I. A. E.

relatives left London, England, for Tillbury, where they boarded the Minnewaska for New York. Thus was begun the official visit of the British engineers to the Society of Automobile Engineers of America. The party is due to arrive in this country Monday, May 26. A tour of inspection and the midsummer meeting of the American society will occupy the attention of the visitors for the succeeding three weeks. The members of the party include the following:

Institution of Automobile Engineers—President T. B. Browne, London; Secretary Basil H. Joy, London; Councillors T. C. Pullinger, Paisley, and Charles Wheeler, London; F. S. Bennett, H. Massac Buist, F. E. Filer, London; Carl F. Benson, T. A. Mackle, Lucien Bollack, Coventry; C. A. Branston, Cambridge; T. Clarkson, Chelmsford; J. B. Ferguson, Belfast; J. Inglis Ker, Glasgow; J. A. Prestwich, Tottenham; R. W. Smith, Redditch; E. B. Wood, E. Wooler, Bristol.

Society of Motor Manufacturers & Traders—J. B. Dunlop, Dublin; C. Gilbert Moore, Twickenham; Tom Norton, Llandrindod Wells; E. C. Paskell, Birmingham.

Relatives—Mrs. T. B. Browne, London; Mrs. T. Clarkson, Chelmsford; Mrs. T. C. Pullinger, Paisley; Mrs. E. B. Wood, Bristol; Mr. Smith, Jr., Redditch.

The event is of decided importance to the industry, both in this country and in Great Britain. The trip was planned as a return visit for that which was enjoyed by members of the Society of Automobile Engineers while abroad in November and December, 1911. As such it will serve to renew friendships made at that time, but it also will afford opportunity for British engineers and manufacturers to become familiar with production methods in vogue in America, and for American manufacturers and others to gain valuable information from their guests.

The exact time of arrival in New York is uncertain, but it is expected that it will be between 10 in the morning and 3 in the afternoon. The party will be met at the pier by officials of the Society of Automobile Engineers and members of the Metropolitan section, the latter being the New York hosts, and conducted to the Hotel McAlpin, which will be the official headquarters during the two-day stay in the city. Thereafter the programme of entertainment will be as follows:

Monday, May 26—Afternoon, baseball game; evening, beefsteak dinner.

Tuesday, May 27—New York City. Morning, visit to the tower of the Woolworth building, Battery park and Wall street, Brooklyn bridge, Prospect park in Brooklyn, Williamsburg bridge, and inspection of testing laboratory of Automobile Club of America. Luncheon at the club. Afternoon, drive uptown, going through Central park, Riverside drive, Eastern boulevard and Grand concourse. Demonstration of fire department apparatus. Evening, regular May session of the Metropolitan section, S. A. E., at which papers on the various phases of motor starting devices will be read.

Wednesday, May 28—En route to Pittsburg. Leave New York over the Pennsylvania railroad at 10:50 in the morning and arrive in Pittsburg at 7:55 in the evening.

Thursday, May 29—Pittsburg. Breakfast at Pittsburg Athletic Club. Trolley to Carnegie-Homestead Steel Works for inspection of plant. Luncheon on the boat to McKeesport for inspection of works of the National Tube Company. Dinner at Fort Pitt hotel. Leave for Indianapolis at 8:55 in the evening.

Friday, May 30—Indianapolis. Arrive at 7:20 in the morning. As guests of the Indianapolis motor speedway management, party will be conveyed to the speedway, where a special stand will be reserved during the 500-mile international sweepstakes race.

Saturday, May 31—Indianapolis. Morning, inspection of Wheeler & Schebler and Prest-O-Lite plants. Luncheon at the Canoe Club. Afternoon, drive around the city, ending in a barbecue. Leave for Detroit at 9 in the evening.

Sunday, June 1—Detroit. Arrive at 7:20. Party will be met by delegates to the annual midsummer meeting of the S. A. E., and escorted to the Hotel Pontchartrain. Automobiles will be placed at the disposal of the guests that they may visit points of interest at their discretion.

Monday, June 2—Detroit. Morning, inspection of Ford Motor Company's plant. Luncheon at Ardussi's. Afternoon at the works of the Cadillac Motor Car Company. Evening at Temple theatre.

Tuesday, June 3.—Detroit. Morning, inspection of Packard Motor Car Company's plant, the party being the

Vice President John G. Perrin, S. A. E.; Councillor T. C. Pullinger, I. A. E.

guests of the company at luncheon. Afternoon, visit to Timken-Detroit Axle Company's factory. Evening, official banquet of the S. A. E. to the I. A. E. at the Hotel Pontchartrain.

Digitized by Google

Wednesday, June 4.—Detroit. Morning, inspection of the works of the Hudson Motor Car Company, the Continental Motor Manufacturing Company and the Chalmers Motor Company, with luncheon as the guests of the last named concern. Afternoon, embark at 3 on the lake

Vice President Russell Huff, S. A. E.; Councillor Charles Wheeler, I. A. E.

steamer City of Detroit III for the three-day midsummer outing and meeting of the S. A. E.

Thursday, June 5—Saulte Ste. Marie. First and second sessions of the midsummer meeting will be held on board the boat traversing Lake Huron on the way to Saulte Ste. Marie, which will be reached in the afternoon. Return to the boat at 6 in the evening, with special entertainment on board, leaving late at night for Mackinac island.

Friday, June 6—Mackinac island. Morning, third session of S. A. E. meeting on board ship. Arrive at Mackinac island at 3 in the afternoon. Ashore during the afternoon. Leave at 7 in the evening, with entertainment on shipboard.

Saturday, June 7—Detroit. Morning, fourth session of S. A. E. meeting on shipboard. Arrive at Detroit at 3 in the afternoon. Leave at 10 in the evening by D. & C. steamer for Cleveland.

Sunday, June 8—Cleveland. Arrive at 7 in the morning. Party will be met by local reception committee and escorted to Hotel Statler. The day will be devoted to motor car drives about the city and at country clubs in that vicinity.

Monday, June 9—Cleveland. Morning, inspection of the factories of the Peerless Motor Car Company, Winton Motor Car Company and White Company. Afternoon, drive to Akron, O., for inspection of Goodyear Tire & Rubber Company's plant. Leave by boat for Buffalo at 8 in the evening.

Tuesday, June 10—Buffalo. Arrive at 7 in the morning. The party will be the guests of the Pierce-Arrow Motor Car Company, and will be conveyed in automobiles from the boat to the factory, where luncheon will be served after the inspection of the plant. Afternoon, trolley to Niagara Falls for the inspection of the electric power plant. (Those who desire to return to England on board the Mauretania will leave Buffalo for New York during the afternoon. The remainder of the party will take the extension trip to New England.)

Wednesday, June 11—Providence. Arrive at 11 in the morning, after a night trip from Buffalo with a change of cars at Worcester. Breakfast on the train. Inspection of works of the Brown & Sharpe Manufacturing Company and Potter & Johnson Company, Pawtucket. Leave at 6:35 in the evening. Dinner on the train en route for Bridgeport. Arrive at 9:30.

Thursday, June 12—Bridgeport and New Haven. Morning, inspection of plants of the Locomobile Company of America and the Spring Perch Company. Luncheon as guests of the Locomobile Company of America. Afternoon, motor to New Haven. Arrive 2:30. Visit to plant of New Haven Carriage Company. Night at Hotel Taft.

Friday, June 13—Hartford. Leave New Haven by automobile at 9 in the morning for Hartford. Inspection of Pratt & Whitney, Pope Manufacturing Company and Hartford Rubber Works Company (subsidiary of the United States Tire Company). Leave by boat for New York at 4 in the afternoon.

Saturday, June 14—New York. Arrive at 7 in the morning. Official tour ends.

It will be seen that the programme is one which leaves but little time unaccounted for, and it may be added that it was with difficulty that the committee of arrangements was able to decide which plants should be inspected, when there was so much to be considered. There remains the programme for the midsummer meeting of the Society of Automobile Engineers, at which papers will be presented by members of the Institution of Automobile Engineers and Society of Motor Manufacturers & Traders. This follows:

Morning, June 5—Presidential address, Howard Marmon; treasurer's report; election of new members; new business; reports of iron and steel division, Henry Souther, chairman, and ball and roller bearings division, David Ferguson, chairman; paper, "Manufacture and Physical Properties of Malleable Iron," Enrique Touceda; paper, "A New Tensile Test-Piece and Holder," K. W. Zimmerschied; paper, "Pneumatic Tires," Paul W. Litchfield; paper, "Lubricating Oils," Harry Tipper; topics for discussion, "Design and Treatment of Leaf Springs" and "Worm Gears."

Afternoon, June 5—Paper, "Public Service Vehicles," T. B. Browne, president I. A. E.; paper, "Steam Buses," Thomas Clarkson, member of Society of Motor Manufacturers & Traders; paper, "Calculating Depreciation on Commercial Automobiles," Charles Wheeler, I. A. E.; paper, "Jackshaft vs. Double-Rear-Wheel Brakes," Arthur M. Laycock; paper, "Metal Wheels," Arthur J. Slade; report of truck standards division, William P. Kennedy, chairman; report of commercial car wheels division, William P. Kennedy, chairman; topic for discussion, "Comparative Efficiency of Solid Motor Tires."

Morning, June 6—Paper, "Automobile Production Inspection Methods," F. F. Beall; paper, "Influence of the Sales Department on the Design of Motor Cars," F. E. Moskovics; paper, "Wire Wheels," George W. Houk; paper, "Motor Construction," Claude E. Cox; reports of divisions, electrical equipment, Andrew L. Riker, chairman; broaches, C. W. Spicer, chairman; pleasure car wheels, Henry Souther, chairman; nomenclature, Elliott J. Stoddard, chairman; miscellaneous, Arthur Holmes, chairman; topics for discussion, "Electric Motor Starters," "Possibilities and Limitations of Utilization of Electricity in Operative Motor Car Functions," "Possibility of Weight Reduction in Motor Car Design" and "Hobbing Methods."

Morning, June 7—Paper, "Engine Testing," E. B.

The Two Secretaries: Coker F. Clarkson, S. A. E.; Basil H. Joy, I. A. E.

Wood, I. A. E.; paper, "Motor or Carburetor Test Data," Herbert Chase; paper, "Tests of Automobiles," Prof. L. V. Luddy; report of motor testing division, John O. Heinze, chairman; topics for discussion, "Gasoline Motor Fuels," "Carburetor Nozzle Action" and "Motor Manifolds."

GENERAL NEWS OF THE INDUSTRY.

Automobile Chamber of Commerce Supplants Older Manufacturers' Organizations—Announcement of First Kerosene Car—Concerns Increase Capital.

AS FAR as active work is concerned, the National Association of Automobile Manufacturers, organized 13 years ago, and the Automobile Board of Trade, organized two years ago, after the dissolution of the Association of Licensed Automobile Manufacturers, have ceased to exist and all affairs of both organizations are now transferred to the Automobile Chamber of Commerce. The first steps to bring about a consolidation were taken at a meeting in Chicago in 1912, when each of the associations appointed a conference committee.

The Automobile Chamber of Commerce was incorporated March 18 by the 14 men who had composed the executive committee of the N. A. A. M., and C. C. Hanch, the only director of the Board of Trade who was not also a member of that committee. The necessity of observing certain legal requirements delayed the actual transfer of all funds, records and books of both bodies to the new organization until now. All the departments of the old associations will be continued under the same management. S. A. Miles, for 10 years general manager of the N. A. A. M., retains that position with the new organization, with H. A. Bonnell as assistant general manager. The traffic department remains in charge of J. S. Marvin and the commercial vehicle work in charge of H. W. Perry, to whose department will probably be added a bureau of publicity with particular reference to the interests of good roads. The officers of the Chamber of Commerce are:

President, Charles Clifton; vice president, Wilfred C. Leland; vice president in charge of gasoline vehicle department, Hugh Chalmers; vice president in charge of commercial vehicle department, W. T. White; vice president in charge of electric vehicle department, H. H. Rice; treasurer, George Pope; secretary, R. D. Chapin; patent committee, C. C. Hanch, W. H. Van Dervoort, L. H. Kittredge, Alvan Macaulay, L. E. Latta; show committee, George Pope, H. O. Smith, Wilfred C. Leland; traffic committee, A. L. Pope, W. E. Metzger, H. H. Rice; legislative committee, J. N. Gunn, G. H. Stilwell, J. I. Farley.

DIVIDES WITH EMPLOYEES.

Williams Foundry & Machine Company Presents Men with Part of the Profits.

J. K. Williams, president and founder of the Williams Foundry & Machine Company, Akron, O., recently personally presented each and all of the employees of that concern with an envelope containing a substantial sum of money. An accompanying card presented the reason for the gift. The company has had a prosperous year and recognizing the part played by its faithful non-salaried employees dispensed among them $1500.

Five hundred dollars was divided according to the length of service with the company, by which was meant uninterrupted service, except for necessary absence, for more than a year previous to March 29, 1913, and $1000 was apportioned according to the number of hours worked during the year regardless of amount earned. Last year the company distributed $1000 among its employees and that labor troubles are and have always been unknown in its factory may be ascribed, in part at least, to the above action.

STEWART-WARNER PERSONNEL.

Three Well Known Men Selected to Head Various Departments.

The Stewart-Warner Speedometer Corporation, Chicago, announces the appointment of three new men as department heads. Gridley Adams, who throughout the life of that organization was a member of the staff of the United States Motor Company, becomes advertising manager with headquarters at the Chicago plant. Mr. Adams is not only well known in the automobile industry, but has a wide acquaintance in the musical field, having at one time been connected with the Aeolian Company. He is regarded as an advertising man of large capabilities and his many friends are confident of his success in the accessory field.

F. W. Baum, for many years one of the best known figures in the motorcycle industry and with a wide reputation as a brilliant writer on motorcycle subjects, has become the head of the motorcycle speedometer department. Mr. Baum will devote his entire time to the demonstration of the new Stewart two-belt instrument in various sections, spending a week or more in each of the Stewart-Warner branch houses.

W. G. Tennant, who has been connected with the sales department of the Peerless Motor Car Company, will call on the entire trade in the interests of the Stewart-Warner instruments. He

Digitized by Google

will devote much of his time to special sales work with motor car manufacturers and large dealers.

ONLY ONE CHANGE MADE.

Officers and Directors of Paige-Detroit Company Re-Elected With This Exception.

Only one change was made in the official personnel of the Paige-Detroit Motor Car Company, Detroit, maker of Paige cars, at the annual meeting of the directors. Alexander McPherson announced his resignation from the directorate and his place was filled by J. F. Borquin, general manager of the company. The election resulted as follows: President, H. M. Jewett; vice president, E. H. Jewett; treasurer, Gilbert Lee; secretary, William B. Cady; general manager, James F. Borquin; directors, E. J. Jewett, H. M. Jewett, Sherman L. DePew, E. D. Stair, Willis E. Buhl, C. B. Warren, Charles H. Hodges, Gilbert Lee, J. F. Borquin.

Plans were discussed to provide for increased facilities needed to care for future business. Beginning May 1, H. M. Jewett, president of the corporation, severed all active participation in all other interests to devote the major portion of his time to the development of the Paige industry.

JOINS STEARNS COMPANY.

Guy Vaughan Leaves Olds Motor Works to Take up New Engineering Work.

Guy Vaughan, automobile designer and engineer, well known throughout the country, has resigned from the General Motors Company and severed his connection with the Olds Motor Works, Lansing, Mich., a subsidiary of that concern, to take an executive position with the F. B. Stearns Company, Cleveland, O., maker of Stearns-Knight cars. His connection with the Stearns company gives Mr. Vaughan a newer and broader field of endeavor and his activities with that company will be of a general engineering nature, covering every phase of automobile engineering, motor, chassis and body designing.

Mr. Vaughan at one time brought out a car under his own name, which was very successful both from an engineering and selling standpoint. Later his health compelled him to give up active association with the company building his machine, and take a rest of about a year. Just previous to his connection with the General Motors Company as consulting engineer of the Olds Motor Works, he designed the light duty electric truck chassis for the Buffalo Electric Vehicle Company.

WITH G. C. VAPORIZER.

Well Known Advertising Man Becomes General Manager of New Concern.

Arthur Waterman is now general manager of the G. C. Vaporizer Company of America, Inc., recently organized to produce the G. C. vaporizer, a device for using kerosene and the heavier products of petroleum as fuel for motor cars, motor trucks, motor boats and practically all internal combustion engines. Mr. Waterman has been connected with the automobile industry practically since its inception and has had a highly successful career.

Arthur Waterman, General Manager, G. C. Vaporizer Company.

He is perhaps best known in conjunction with his eminently successful record as manager of the advertising and sales departments of the Hartford Suspension Company, Jersey City, N. J., maker of the Truffault-Hartford shock absorber, which position he held for six years. During his incumbency his progressive methods and keen insight into the exigencies of the business served to create a large and insistent demand for the company's product, thereby greatly increasing the output of its factory and necessitating provision for additional manufacturing facilities.

Mr. Waterman resigned his position last winter and has been closely identified since that time with the organization of the G. C. Vaporizer Company of America. His many friends in the industry are congratulating him upon his advancement and judging from his past record there is every reason to believe that his future success will be as pleasing to them as is the contemplation of his past achievements.

ANNOUNCES KEROSENE CARBURETOR.

Henderson for 1914 Will Be Fitted with Harroun Device if Desired.

Following the plan adopted last year, the Henderson Motor Car Company, Indianapolis, Ind., will make its formal announcement of the 1914 Henderson line during the progress of the 500-mile race on the Indianapolis motor speedway, Memorial Day. The new cars will be on exhibition at the Claypool hotel.

A particularly interesting feature in connection with this announcement, some advance information concerning which has been supplied by the company, is that the new series will offer what the maker believes to be the first practical kerosene carburetor. It is understood that this will be supplied in the nature of an optional equipment, and the device is the invention of Ray Harroun, the performance of which was mentioned in these columns in the last issue.

SHOCK ABSORBER SUIT.

Blackledge Company Alleges That J. M. Concern Infringes Its Patent.

The John W. Blackledge Manufacturing Company, Chicago, maker of the Velvet shock absorbing springs, has brought suit in the United States district court for the northern eastern district, eastern Illinois, against the J. M. Shock Absorber Company, Philadelphia, maker of the J. M. shock absorber, alleging infringement of patent 988,229, issued March 28, 1911. The Blackledge company claims that it owns the basic patent applying to spring shock absorbers, operating on the principle of connecting at the shackle joint.

According to the plaintiff in this action the Blackledge Velvet spring, operating on the principle in question, was placed on the market and in general use before the J. M. company was in existence, either in Europe or this country.

TO ADD NEW BUILDINGS.

United States Tire Company to Enlarge Its Production Facilities at Detroit.

Several of the 16 new buildings which are contemplated as additions to the United States Tire Company's Detroit plant, the capacity of which will be more than doubled, have been completed and are being utilized in maintaining an increased tire production which this year's business has demonstrated will be necessary.

In addition to extensive improvements at its three other plants, it is the aim of the United States Tire Company to make the Detroit factory its chief base of operation and as a result of this determination more than 1,000,000 feet of floor space will be added to the present dimensions of this mill. President Samuel P. Colt of the company reports that the company's sales the first three months this year show an increase of about 40 per cent. over those of the corresponding months last year.

TREASURY STOCK SOLD.

Miller Rubber Company Plans to Increase Capital to $2,000,000.

Subscriptions for the $200,000 treasury stock of the Miller Rubber Company, Akron, O., maker of Miller tires, which was offered to the stockholders, were received up to and including May 5. Payments are to be made in three installments and the new stock certificates will be issued July 5. A meeting will be called later to increase the capital stock from $1,000,000 to $2,000,000.

A letter to stockholders states that the company is completing buildings which will practically double the factory space. With new machinery which has been ordered the company will be in a position to make about 1000 automobile tires a day and increase all other producing departments.

TO PRODUCE NEW RIM.

George Drake Organizes Company in Detroit to Develop His Invention.

George Drake, 200 King avenue, Detroit, who recently obtained a patent on a new type of demountable and detachable automobile rim, has planned to organize a stock company to place the rim on the market. The plant of the company will be located in Detroit, according to the plans of the inventor and those associated with him in the enterprise. The firm name will be Drake-Promenchenkel Rim Company.

The rim works with intersecting threads and grooves. It can be used on either side, according to those who are familiar with the device. An inner flange works on the same principle and a fork contrivance prevents the rim from slipping off when the automobile is backed up.

Digitized by Google

UTILIZING CHEAPER FUELS.

Manufacturers Adopt Plan Which Is Expected to Result in Decided Gasoline Saving.

As a reaction against the high price of gasoline, automobile manufacturers are beginning to employ cheaper fuels for testing purposes and while this practise has not yet become general, from present indications it is safe to predict that it represents a possible saving of upwards of 3,000,000 gallons of gasoline within the next 12 months. On the same basis of calculation the employment of cheaper fuels for motor testing will involve a direct saving of at least $1,750,000.

This was one of the many phases of the gasoline situation considered at a meeting held at New York City by the special investigating committee of the Society of Automobile Engineers recently appointed to co-operate with the gasoline producers and others in seeking a solution of the automobile fuel problem. A preliminary canvass of the work to be done has disclosed that the investigation should be organized upon a rather more elaborate basis than seemed needful at the outset. In view of this actual productive work cannot be undertaken until certain pending arrangements with respect to laboratory facilities and other matters are perfected.

LEAVES INTERNATIONAL MOTOR.

R. W. Hutchinson, Jr., Well Known Motor Truck Writer, Resigns.

Rollin W. Hutchinson, Jr., advertising manager of the International Motor Company, New York City, maker of Mack, Saurer and Hewitt trucks, has resigned his position, to take effect June 1. His future plans are not yet announced. Mr. Hutchinson has had charge of the advertising and publicity of the International company and its predecessor, the Saurer Motor Company, since their establishment, and has acquired a unique reputation among motor writers for his broad and comprehensive knowledge of motor truck subjects and the attitude of business interests toward them.

Being a graduate engineer and a student of mechanical sciences, his view of the motor industry has been especially intelligent and comprehensive and his articles on trucking subjects and traffic economies have given him a national reputation as a writer and student of these topics. As a producer of genuinely educational publicity he has been prolific and distinguished.

JOINS EMPIRE FORCES.

Lawrence R. Wilbur Becomes Assistant General Manager, Aiding C. E. Gibson.

Lawrence R. Wilbur, a prominent member of the Indianapolis motor world, has been made assistant general manager of the Empire Automobile Company, Indianapolis, Ind., maker of Empire cars, popularly known as the "Little Aristocrat." Mr. Wilbur has been identified with the automobile industry since 1908, when he became connected with the Willys-Overland Company at Toledo, O.

In the fall of 1910 he went to Indianapolis and as secretary-treasurer helped to organize the Marion Sales Company, which at that time sold the entire Marion output. When in July the new Marion Motor Car Company took over the sales and manufacturing of Marion cars, the new A. & M. Sales & Service Company of Indianapolis, Marion and American distributor, was organized with Mr. Wilbur as secretary-treasurer.

Lawrence R. Wilbur, with Empire Automobile Company.

In his new connection with the Empire Automobile Company he will have direct charge of the business management of the company's executive office and this will permit C. E. Gibson, general manager, to devote more time to the production of the plant, which in view of the extensive enlargement planned for next year, is of utmost importance.

FIRST CYCLECAR FACTORY.

Economycar Company of Indianapolis Claims That Honor in America.

Since the appearance of the Bedelia, which is regarded as the first cyclecar of Europe, 87 dif-

Digitized by Google

ferent factories have been established abroad for the production of this type of machine. Reports from Detroit indicate that no less than four companies are contemplated in this field during the present year. Indianapolis claims the honor of having the first factory in operation, this being the plant of the Economycar Company, which expects to have its first machine for inspection by manufacturers and dealers during the 500-mile race, Memorial Day.

More details are promised later, but it may be stated that the motor is a two-cylinder, air-cooled unit rated at 8-10 horsepower, drive is by chain or V belt as with conventional motorcycles, wheelbase is 106 inches and tread 36. Wire wheels will be utilized, these taking 28 by three or four-inch tires.

GARAGE OWNERS ORGANIZE.

Massachusetts Concerns Form Association to Benefit Conditions.

The Massachusetts Garage Association, Inc., was formed in Boston, May 1, the object being to place the garage owners of the state on a much higher plane than they have occupied heretofore. It also is expected that the organization will aid greatly in impressing the automobile owner that by dealing with a member he will be safeguarded against overcharge for service rendered or supplies furnished. Any garage owner in the state, who is vouched for by a member of the association, is eligible to membership.

The following officers and directors have been elected:

President, J. S. Hathaway, White Company, Boston; vice president, J. E. Savell, Motor Car Service Company, Boston; secretary-treasurer, Chester I. Campbell, Boston; directors, V. A. Charles, Inter-State Automobile Company, Boston; F. W. Boynton, Hyde Park Auto Station, Hyde Park; John F. Fleming, Brookline Garage, Brookline; J. S. Hathaway; C. E. Harris, Harris Garage Company, Easthampton; J. W. Robertson, Robertson Motor Car Company, Taunton; R. H. Hartley, Church Street Corporation, Lowell, and J. E. Savell.

ERECTING LARGE ADDITION.

Rauch & Lang Carriage Company to Increase Plant for Production of Electrics.

The Rauch & Lang Carriage Company, Cleveland, O., maker of the Rauch & Lang electric automobile, has broken ground for a four-story building at West Twenty-sixth street and Chatham avenue. The new structure will have a frontage of 199 feet on West Twenty-sixth street and 112 feet on Chatham avenue. It will be of brick and steel and will have an unusual amount of light, the walls being largely a framework for the windows.

The structure will be in architectural keeping with the buildings of the present plant, but it will also be designed with regard to the ornamental. A sprinkling system will be installed throughout. This will represent an addition of 78,000 square feet to what is claimed already to be the largest manufacturing plant in the world devoted exclusively to the production of electric pleasure vehicles.

GILBERT SUCCEEDS JEWETT.

Latter Retires as Lozier Head to Devote Entire Time to Paige Cars.

Joseph M. Gilbert has become president and general manager of the Lozier Motor Company, Detroit, maker of Lozier cars, having resigned the general management of the United States Tire Company to engage directly in the manufacture of the automobile. At the election of new officers of the Lozier company held at Detroit, Mr. Gilbert was chosen to succeed Harry M. Jewett of Detroit, who for some months has been president of the company, making a considerable sacrifice of time and business interests to act in that capacity until the contemplated reorganization could be carried into effect.

At the same meeting Harry A. Lozier was elected vice president; Fred Gies, secretary and assistant treasurer, and N. R. Feltes, treasurer. Mr. Jewett, who is a large coal operator in Detroit, will hereafter devote himself chiefly to the Paige-Detroit Motor Car Company, maker of Paige cars, of which he is president and in which he is heavily interested financially. He remains a director and member of the executive committee of the Lozier company.

TO CROSS THE CONTINENT.

Maker of Haney Fire Apparatus to Remove from California to Florida.

The Haney Fire Fighting Apparatus Company, Stockton, Cal., through its president, Edward H. Haney, and its general manager, Edward Olds, announces that it will move to Tampa, Fla., where it will manufacture fire fighting apparatus and motor trucks. The company, which is incorporated for $2,000,000, is said to have purchased 31 acres of land southwest of Tampa and has contracted to build a plant at a cost of $50,000.

Digitized by Google

NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS

Maxi Carburetor.

The Maxi carburetor, type B, manufactured by the Maxi Company, 37 Wall street, New York City, has a mixing chamber which is virtually a tube with two openings to the outer air, either one of which may be utilized for connecting to the source of hot air. There are two fuel adjustments, a low and high, also a low speed air control. There is no adjustment to the main air supply, the object being to admit air to the motor without restriction. A channel leading from the float chamber supplies fuel to the high speed regulating valve, and also furnishes gasoline to the low speed nozzle, which has a gauged orifice at its upper end. When the engine is idling the vacuum is allowed to operate through a low speed regulating valve having a seat, taking the proper amount of fuel through an orifice. The emerging liquid is mixed with air and the mixture passes up through a channel entering the mixing chamber above the throttle valve. Here it is further mixed with air controlled by the low speed air member. The channel has a number of drilled holes, which when the throttle valve is closed, are open to the atmosphere by way of the main air ports. The air passing through the holes partially reduces the vacuum around the orifice member, A bushing, also open to the atmosphere, operates in a similar manner to the holes. As the throttle valve is opened the holes are successively brought into a position above it, increasing the vacuum about the orifice, and supplying more liquid. From one-quarter to the full open position of the throttle valve, high speed jets are brought successively into action, increasing the suction, resulting in the supply of fuel being augmented in proportion to the air supply. All fuel before entering the carburetor passes through two fine screens.

Miller Polishing Cloth.

Chas. E. Miller, 97-103 Reade street, New York City, is marketing salesmen's sample blankets, which are used for washing, wiping and polishing cloths. They are made in three sizes, 20 by 5.5, 20 by 8.5 and 20 by 11.5 inches, and are double and crochet stitched around the edge. The cloths are strong and elastic, will not tear and can be washed and used over and over again. They are inexpensive.

Vesta Motorcycle Rear Lamp.

The Vesta Accumulator Company, 2100 Indiana avenue, Chicago, is manufacturing a lamp especially adapted to motorcycles. It is an electric unit, is provided with the conventional red semaphore and has a vertical ray of white light for illuminating the license number. The last named is secured to the bracket and the lamp is adjustable. The construction is sturdy and the workmanship and material are high grade.

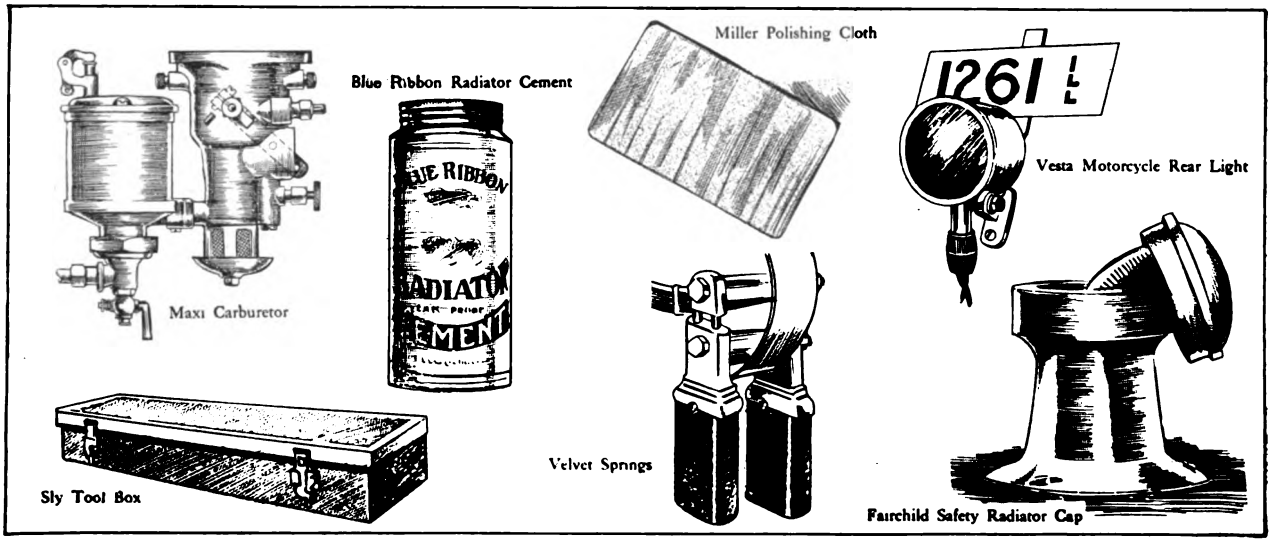
Blue Ribbon Radiator Cement.

Blue Ribbon leak proof radiator cement is the product of the International Metal Polish Company, Indianapolis, Ind., and is guaranteed by the maker to repair an ordinary leak in a few minutes. It is placed in the radiator and mingling with the water, is carried throughout the circulating system, stopping leaks through the composition hardening when exposed to the air. It is pointed out that the cement will not injure the metal, nor is the efficiency of the radiator impaired by its use. It comes in small screw top cans and is a valuable addition to the equipment when touring as leaks may be mended in out of the way localities.

Sly Steel Tool Box.

The Sly steel tool box is marketed by Smalley Daniels, Detroit, and all sizes are made to order at short notice to meet individual requirements. The finish is made to match that of the car and the fittings may be brass or nickel plated as desired. The best type of toggle or suit case lock is utilized. Battery boxes are also constructed to order.

Velvet Springs.



The Blackledge shock absorbing Velvet springs are marketed by the John W. Blackledge Manufacturing Company, 2112 Michigan avenue, Chicago, and are noticeable for their compactness and neat design. When attached to the car they become a part of the main springs and the design of the shock absorbers is such that they adjust themselves to varying loads and roads. The springs are so held that side sway is eliminated and among the advantages of the Velvet springs is that they may be attached in a few minutes. No boring or special fittings are necessary. They come in sets of two for the rear springs of the car and are designed for machines of varying weights.

Fairchild Safety Radiator Cap.

H. C. Fairchild, Maplewood, N. J., is manufacturing the Fairchild safety spring radiator cap, which is designed for model T Ford cars. The device replaces the usual member, is neat in appearance, and being retained by a spring is easily removed and replaced. It is impossible to lose the cap, and considerable time is saved in examining the radiator to note if it contains the proper supply of water, as there are no threads. Sticking caps are eliminated and the device serves as a safety valve as it is displaced when steam is generated by the overheating of the motor, thus notifying the operator of a hot engine. The Fairchild cap is easily attached and is moderately priced.

Apco Ford Foot Accelerator.

The Auto Parts Company, Providence, R. I., maker of Ford specialties, is marketing the Apco foot accelerator, designed especially for model T Ford cars. By its use the driver is enabled to control the throttle by the foot, leaving both hands free to operate the car, an advantage when travelling in crowded traffic or on long trips. It enables the setting of the wheel throttle lever to 10 miles an hour for example, and when high car speed is desired,

Digitized by Google

the accelerator is depressed. The device requires but a short time to attach and does not interfere in any way with the regular control of the machine. The pedal is secured by two screws and does not multilate the floorboard.

Simplex Water Economizer.

The B-L Sales Company, Chicago, is manufacturing the Simplex water economizer, which is designed to be attached to the end of a hose. It is fitted with a nozzle and includes a valve actuated by a thumb plunger which when pressed, allows the water to pass through and automatically closes when the pressure is released. It is claimed that the device saves a large percentage of water from being wasted. It is moderately priced.

Harris' Gasoline Gauge.

The Approved Auto Specialties Company, 1731 Broadway, New York City, is marketing Harris' gasoline gauge, which presents practical features in that the height of the fuel in the supply tank is correctly indicated, and the readings are not affected when the car is on grades, etc. The gauge operates on the principle of liquid balance and is free from mechanism or moving parts. The gauge proper comprises a short section of heavy glass tubing, protected by nickel plated metal trimmings. An U tube carrying a red fluid is connected to the gauge and the rise and fall of the fuel in the tank raises or lowers the colored liquid in the gauge through compression of the air, compressed by hydrostatic pressure. All connections are made air tight and a small cup in the gasoline tank has a small notch at its lower edge. This allows the fuel to flow into the cup when it is poured into the container. Upon the liquid reaching the height of the notch the tube leading to the U shaped member is closed. As the fuel rises in the tank the air in the tube is compressed, the red liquid rising in the gauge proportionately to the amount of gasoline, and vice versa. When a pressure feed is utilized an additional tube connects the top of the tank to the top of the gauge. The gauge may be placed at any height above or below the tank, and is adaptable to fuel or oil systems.

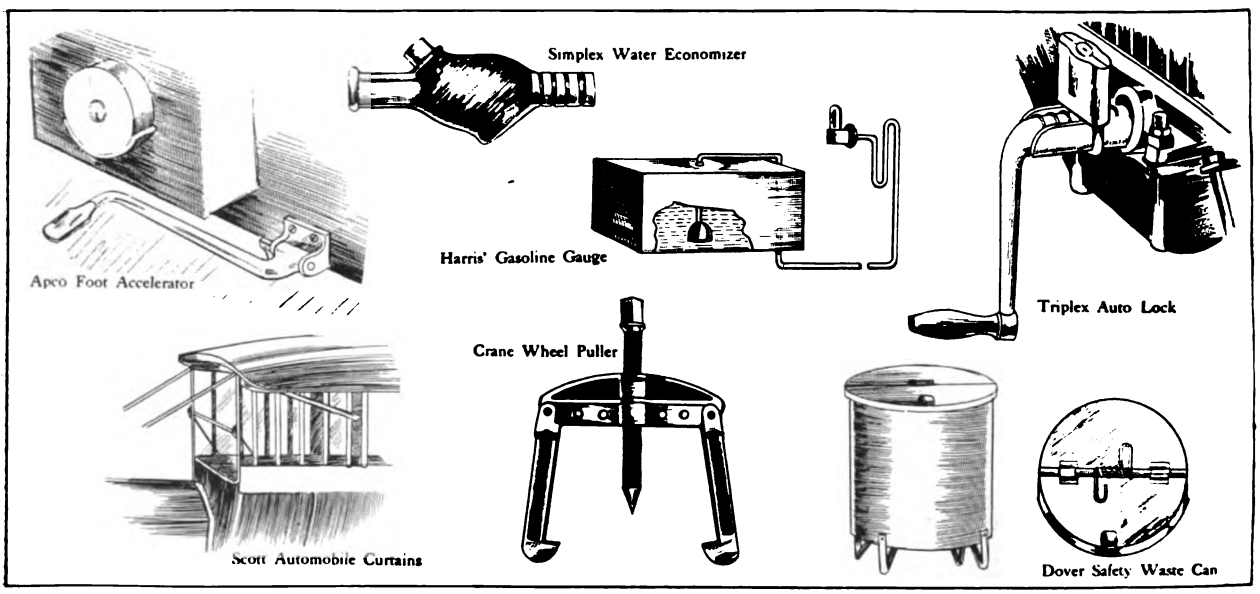
Dover Safety Waste Can.

The Dover Stamping & Manufacturing Company, Cambridge, Mass., is marketing the Dover safety can, which is a receptacle for oily waste and a positive safeguard against spontaneous combustion. It is constructed of heavy galvanized metal and is provided with a self-closing cover, making it impossible for the workmen to leave the container open. The can is fireproof and is made in varying sizes.

Triplex Auto Lock.

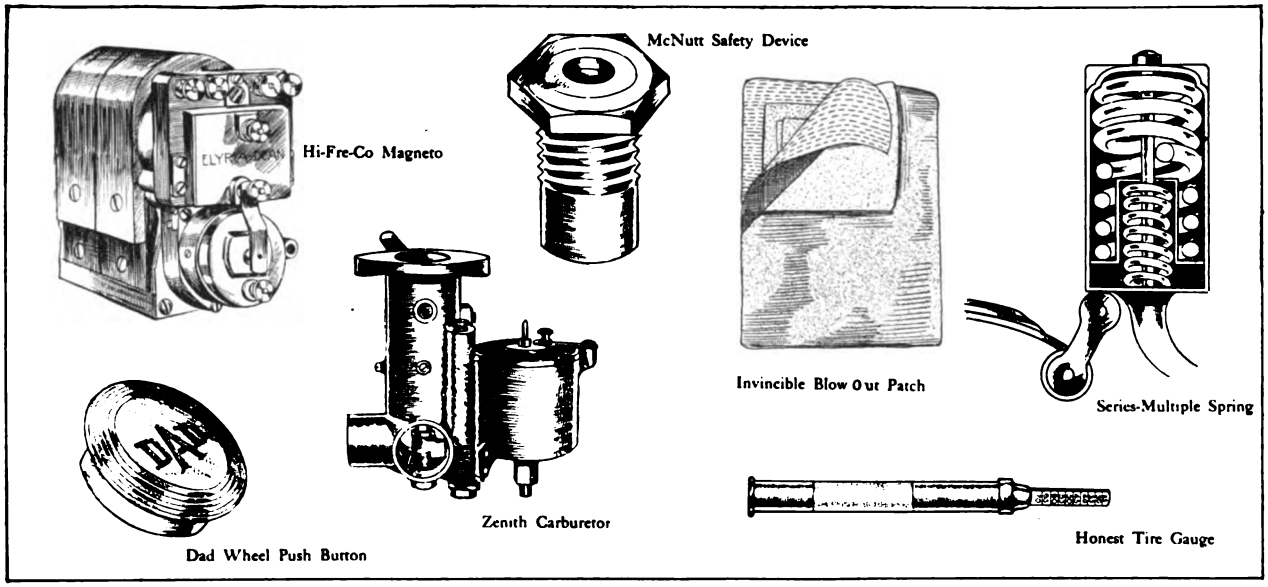
The Bremer-Wilson Manufacturing Company, 1421 Michigan avenue, Chicago, is producing the Triplex auto lock, designed for model T Ford cars and others of a similar size. It comprises a lock with steel shackles, these being secured to a semi-circular clip, which is placed around the starting crank, preventing the latter from being pushed in or meshed with the crankshaft of the motor. The padlock is sturdily constructed and is so arranged that the shackle springs open when unlocked. A stop is also provided so that the device may be fitted easily in the dark. Two keys are supplied with each lock and there are no duplicates outside of those furnished.

New Scott Automobile Curtains.



The Star Storm Front Company, Troy, O., is manufacturing what is termed the New Scott automobile curtains, which make for convenience in that they are not removed and may be placed in position in a few seconds. The fixtures consist of a pair of double-channel housings of pressed sheet metal, one for either side of the car, and each contains two all-metal rollers on which the curtains operate automatically. The fixtures, which are attached to the front bow, are held in place at the top and bottom, and the connections are rattle proof. All curtains are operated and fastened from the inside, and when drawn are held securely in place by hooks. The tension of the spring members is said to keep the curtains free from wrinkles. Any size or shape celluloid lights may be fitted. When not in use the curtains roll up and the fixtures do not detract from the appearance of the car.

Crane Wheel Puller.



The William Crane Company, Boston, is marketing the Crane improved patent wheel and gear puller, which is constructed in two sizes. The larger tool has two or three arms, beam radius of seven inches and hook and extension arms 10 inches long. The small size is made with two or three arms, has a five-inch beam radius, with hook arms six and nine inches long. The puller is drop forged from a high grade carbon steel, and the screws are cut by special machinery and case hardened all over. It can be employed on work of considerable diameter by heating the arms and bending them to fit. The company offers to replace any puller broken on any legitimate work. The Waite Auto Supply Company, 81 Exchange Place, Providence, R. I., is distributor.

Hi-Fre-Co Magneto.

The Hi-Fre-Co magneto is an Elyria-Dean product, being manufactured by the Dean Electric Company, Elyria, O. It differs from the conventional types of magnetos in that a high frequency spark is produced. It is oscillatory in character, 500,000 to 1,000,000 cycles a second being used. The gas is ignited by ionizing, and embracing a larger volume of gas molecules, makes for a more rapid and complete combustion. It is stated that poor mixtures are easily ignited. The wiring carries low voltage currents and little resonator coils step-up the pressure. It is held that leakage is eliminated and that the use of high insulation in the magneto, switch and connecting wires is not necessary. High cylinder pressures are held to have less effect on the spark than with conventional systems. A feature of the Hi-Fre-Co is

Digitized by Google

that wide spark plug gaps are permissible, .0625 to .09375-inch, and that the disruptive action of the spark overcomes fouling. It is pointed out that the motor may be operated on the magneto at very low speeds and that the gas will ignite below 50 revolutions a minute, making the magneto especially adaptable to motor starting systems. The Hi-Fre-Co is made with resonators, also with a dual coil and combined dash switch, and for four and six-cylinder motors.

McNutt Safety Device.

The McNutt safety device is the product of the McNutt Can Company, 352 Pearl street, New York City, and is designed for installation in fuel tanks of all dimensions. It sounds a warning as soon as a dangerous pressure occurs by making a loud whistling noise, and a safety valve releases the pressure. The screw cap is provided with a fusible disc valve, which when the tank is subjected to contact with fire, will give vent to the pressure, thus preventing explosion. The valve seat will melt at 300 degrees Fahrenheit, and the entire valve will blow out, leaving a clear opening and preventing bursting of the container. Further protection is afforded by a fire sceen located at the bottom of the device, it preventing the flame back-drafting into the tank. The safety screw cap is provided with a check valve for gravity systems, preventing vapors from leaving the tank, but permitting air to enter to break the vacuum. It is utilized on the battleships of the United States navy.

Invincible Blow-Out Patch.

The Invincible Tire Company, 53 Sabin street, Providence, R. I., has brought out a blow-out patch in which is incorporated the non-puncture and non-blow-out features of the Invincible tire. The patch differs from those of conventional practise in that in addition to the usual fabric there are two layers of chrome leather. These are between the layers of fabric, and being very pliable conform readily to the casing when inserted. One side of the outer fabric is coated with pure para gum, protected from dirt, etc., by a holland cover. When use of the patch is desired, the cover is stripped and the gum surface moistened with gasoline. This side of the patch is applied to the interior of the casing and being self-vulcanizing, it is impossible for the patch to creep or slip. With the Invincible blow-out patch the use of an outside sleeve is not necessary as the chrome leather reinforces the construction and posseses an additional advantage in that it cannot be punctured. The Invincible is moderately priced and can be utilized over and over again.

Series-Multiple Springs.

The Series-Multiple springs are marketed by the Series-Multiple Spring Company, 1926 Broadway, New York City, and comprise two spirals superimposed and of different capacity. The small spiral yieldingly supports the empty car, the larger member the partly or fully loaded machine, and the leaf spring takes the overload, all working in series. The Series-Multiple are attached to the end of the leaf spring, the spirals being separated by a pressed steel thimble. The nut on the top is to give the small spiral initial tension for either a runabout or a five-passenger car. The housing is of bronze, the spring bracket a drop forging, and all parts are water and dust proof.

Dad Wheel Push Button.

The Dad steering wheel push button is marketed by the Dean Auto Devices Company, 120 South Sangamon street, Chicago, and presents interesting features, among which is that it will close the electrical circuit by touching it at any portion of the moving element. The device is mounted on one of the spokes of the wheel, about .25 inch from the rim, and is so constructed that the slightest touch will operate it. The button member is constructed of a high grade insulated material, nicely finished, and is roughened to prevent slipping of the finger. One of the advantages of the Dad push button is that it may be actuated when the hands are covered with mittens, etc. The equipment includes suitable length of braided cable, and the outfit is moderately priced.

Zenith Carburetor.

The Zenith carburetor, employed on leading makes of cars abroad, is being manufactured in this country by the Zenith Carburetor Company, Detroit. It is claimed that it will provide a perfect mixture regardless of car speeds and is not affected by changes in altitude or by various grades of fuel. The usual springs, valves, pistons, etc., are eliminated, and the throttle is not connected to any moving part to correct operation of a single nozzle. The spraying nozzle is of the compound type and is such that the motor receives a constant mixture at all speeds, and all the air goes past the nozzle. Two jets are utilized, a compensating member which corrects the action of the main jet, and which has a predominating influence at low speeds, as when climbing grades. Easy starting is obtained by a priming tube which extends into the secondary well and opens just below the butterfly valve. When the latter is partially open, a powerful suction is created, effectively priming the cylinders. The Zenith is made in several sizes and enjoys an enviable reputation abroad.

Honest Tire Gauge.

The Honest tire gauge is manufactured by the National Motor Supply Company, Cleveland, O., and by it the pressure of the tires may be ascertained easily and quickly. It is of the pencil type, is very accurate, and is nicely finished. The pressure of the shoes is recorded automatically, the plunger coming to a stop until released. The Honest tire gauge comes in a box on which is printed the proper pressure for each size of tire marketed. It is moderately priced.

HIGH-TENSION MAGNETO ON FORD CAR.

Novel Installation of Bosch Without Altering Power Plant Increases Speed About 20 Per Cent.—Provides Two Independent Ignition Systems.

(By C. P. Shattuck.)

RARE indeed is the motorist who at times has not wished that his engine developed about five horsepower additional in order to cope with

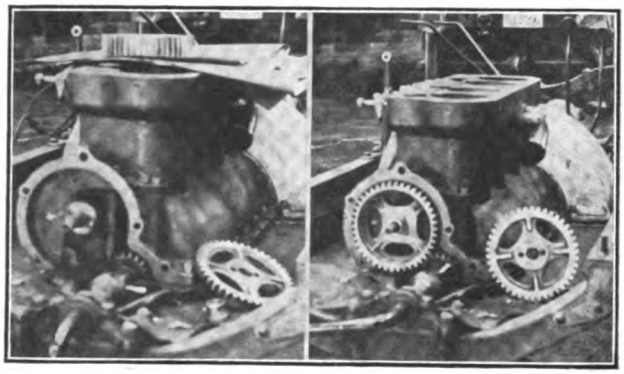

Fig. 1—Showing the Old Gear Displaced (at Left) and Special Gear in Place (at Right).

temporary conditions, such as a strong head wind, steep grades, sandy roads, etc. It is but natural to desire to do as much driving as possible on the high gear, and if this be of such ratio as to give good results normally, more power is usually wanted under abnormal conditions. A given motor to develop its maximum horsepower must in addition to having its reciprocating parts in first class condition and in harmony with each other, be supplied with a perfect mixture and an absolutely synchronized spark. The advantages of synchronization may be summed up as follows: Maximum power, a smooth operating and cool motor, and economy of fuel.

An improvement over normal conditions came under the observation of the writer recently, the car in question being a model T Ford, the owner of which was influenced to install a true high-tension magneto by the performances of similar chassis fitted with such magnetos on the Brooklands track, Weybridge, England. Reports state that mile-a-minute and better speeds were attained.

The installation of the magneto, the various steps of which are shown in the accompanying illustrations, was complicated in that the owner desired the retention of the standard ignition system—the flywheel magneto, commutator and coil—stipulating that no changes were to be made that would interfere with the use of the regular equipment. The silent chain drive utilized on the models abroad was not adaptable under these conditions without alterations involving considerable expense, etc. Ordinarily it would have been possible to replace the timer by a gear, meshing the latter with a gear on the armature shaft of the magneto, and obtaining crankshaft speed by suitably proportioning the driving and driven members.

The problem was solved by Walter G. Swift of the A. C. Danver Company, Inc., Providence, R. I., whose installation presents interesting features in that the magneto is positively driven and the gears are completely enclosed, without altering or cutting the crankcase of the motor. It provides for two separate and independent systems of ignition by utilizing a double system or dual spark plugs, and a triple system may be obtained by the use of dry cells or a storage battery. The third source of current would not, however, be necessary.

Figs. 1 and 2 present the installation clearly. The usual gear on the camshaft, which is retained by dowel pins integral with the shaft, was replaced by a specially designed gear, one providing room for a bearing on the shaft for the commutator. This gear is shown in place at the right at Fig. 1, as well as the old member, the former

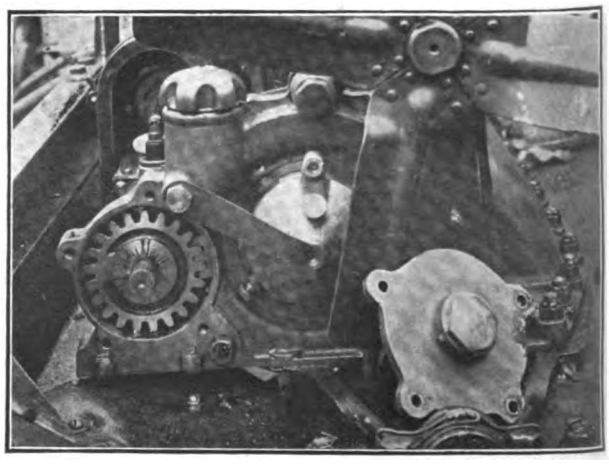

Fig. 2—The Usual Gear Housing Plate Is Replaced by a Special Design, One Carrying a Gear, and the Magneto Is Mounted on a Base Bolted to the Crankcase and Cover Plate.

Digitized by Google

having the same number of teeth as the displaced gear, 42.

In order to obtain a magneto drive at crankshaft speed, necessary with four-cycle, four-cylinder motors, the pinion driving the magneto was cut with 21 teeth. A pattern was made for a special front cylinder cover or housing, it being machined carefully to make it oil tight as the gears operate in lubricant supplied from the crankcase. A removable cover was fitted to the housing, making the magneto gear accessible for timing, etc.

Similar ingenuity is noticeable in the mounting of the magneto, which is a Bosch, made by the Bosch Magneto Company, New York City. A plate is bolted to the upper half of the crankcase and to the special cover, the method of retention being shown at Fig. 2. The magneto is secured in the usual manner, a strap being em-

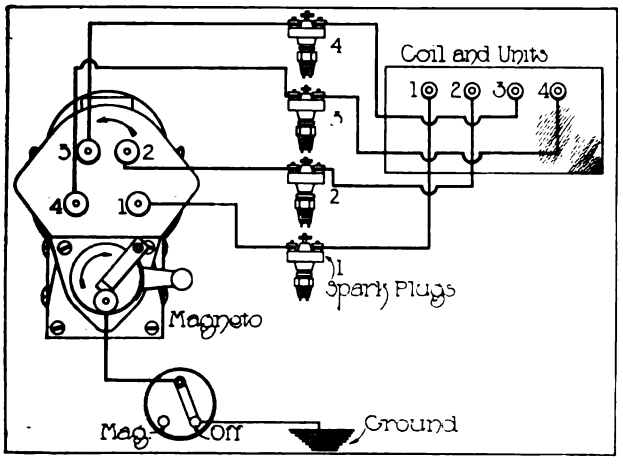

Fig. 3—Wiring Diagram of True High-Tension Magneto and Regular Ignition, Providing Two Independent Systems by Use of Dual Spark Plugs.

ployed. Drive is through a special form of Oldham coupling, which compensates for any possible misalignment.

The advance and retard of the magneto and commutator are simultaneous and are controlled by the usual spark lever. A rod connects the timer with the control rods of the breaker box, bell cranks and ball and sockets being utilized, although these are not shown in the illustrations, as the photographs were taken before the work of the installation was completed.

The writer accompanied Mr. Swift in the trial trips during which three different makes of carburetors were utilized. The first gave the most satisfactory results, the other types showing a tendency to starve the cylinders at high speeds, although apparently providing a good mixture up to 45 miles an hour. The tests were conduct-

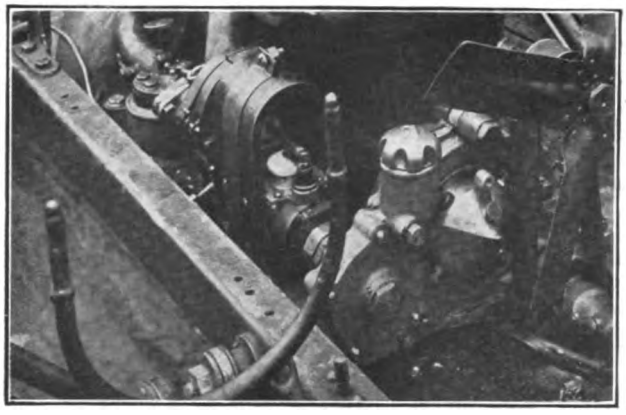

Fig. 4—Showing the Installation of the Magneto on Model T Ford Without Altering the Design of the Power Plant or Removing the Timer.

ed on the road and after the final tuning up a trial was made early in the morning to ascertain the limit of speed.

Previous to the installation of the magneto the car is said to have attained 56 miles an hour, and in explanation it should be stated that it is geared up, the ratio being about 1.4375:1, the usual gearing being 4:1. A standard high grade speedometer was fitted to the chassis and upon entering a straight, level stretch of road the throttle was gradually opened. The motor responded quickly in spite of the high gearing and the indicating hand of the speedometer climbed rapidly, reaching 40 miles an hour in a very brief period. A maximum throttle resulted in 68 miles an hour, and although the adjustment of the carburetor was changed, this speed was not exceeded. Later, the writer was informed that the chassis was driven at a rate of 72 miles an hour.

The car held the road remarkably well in spite of the high speed and in turning out to pass a team straightened up without undue skidding. Although driven at high speeds, there was no in-

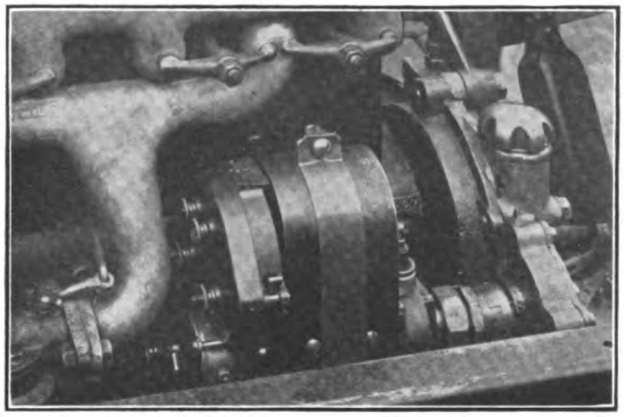

Fig. 5—Side View of the Magneto, Showing Method of Drive Through an Oldham Coupling.

Digitized by Google

dication of heating and the hands could be placed on the radiator without discomfort. During the trip several stops were made to set the carburetor and the motor was subjected to racing that would ordinarily result in boiling of the cooling fluid.

The car showed exceptional hill climbing qualities in spite of the high gearing and took several steep grades much faster, in the opinion of the writer, than similar cars with stock gearing. The engine responded quickly to the throttle and was started easily by a quarter-turn on the Bosch magneto. Mr. Swift is authority for the statement that the mileage a gallon of fuel was considerably more than formerly, according to speedometer readings.

It is the intention of the owner of the car to utilize the flywheel magneto for lighting, the machine being equipped with standard electric headlights. Although the expense of the installation was considerable, due to the special cover, etc., the A. C. Danver Company, Inc., intends to manufacture the fittings in quantities which should bring the cost within the reach of those of moderate means. Any true high-tension magneto of suitable proportions may be utilized and as all parts are accurately machined, the installation should not require any knowledge other than that of timing a magneto.

NATIONAL DEALERS' BODY.

Proposed Meeting for Organization Purposes Scheduled for Indianapolis.

It is understood that a meeting will be held in Indianapolis, Ind., shortly before the holding of the 500-mile race, at which steps will be taken toward the organization of a national association of automobile dealers. This decision was reached at a conference in New York City recently, the details being left to Frederick H. Elliott.

The proposition embraces a plan for united endeavor on the part of the various local associations throughout the country, and it is felt that the interests of dealers would be greatly served by co-operation in such matters as credits, legislative campaigns, etc.

LONG DISTANCE TOURING.

Mr. and Mrs. Williams Plan to Visit Every State in the Union.

To say that he has driven his car into every state in the Union will soon be the proud boast of Howell L. Williams of Bristol, R. I., if present plans do not miscarry. Mr. and Mrs. Williams made a long trip from Rhode Island to Los Angeles, Cal., last summer in a Knox four-cylinder car, made by the Knox Automobile Company, Springfield, Mass., going by way of Chicago, Denver, Salt Lake City, Seattle, and thence down the Pacific Coast, visiting a large number of states en route, as a result of numerous side trips.

They now plan to return by a zig-zag route through the Grand Canyon to Texas, thence north to Montana and the Dakotas, east to Chicago, down the Mississippi valley to the gulf and finally north again, through the Atlantic Coast states. This routing will take them through all the remaining states of the Union.

ANNUAL ORPHANS' DAY.

New York Dealers Place Cars at Disposal of the Committee.

Judging by the way the automobile dealers of New York City and vicinity are offering their machines to give the orphans of New York City their annual automobile ride and outing on June 5 at Glen Island, New Rochelle, N. Y., it is evident that this year's outing will be a most successful one. Thus early touring cars have been offered by the following:

Whiting Motor Company, Mercer; Knox Automobile Company, Knox-Martin tractor and touring car; Rodney K. Haines, two Regals; W. A. Allen, Metallurgique; K. C. Pardee, two Detroiters; A. G. Spalding & Bro., Stevens-Duryea; De Dion-Bouton Selling Branch, two De Dion-Bouton touring cars and one truck; C. H. Larson, Oldsmobile; F. L. Sample, Chalmers; Poertner Motor Car Company, three to seven Nationals; Thomas B. Jeffery Company of New York, Rambler; American Locomotive Company, Alco; Oakland Motor Company, Oakland; Garland Auto Company, Velie truck; Francis H. Leggett & Co., Alco truck.

With the Chicago-Boston non-stop reliability run starting June 25, a number of Indianapolis manufacturers who had hoped to enter the event will be unable to do so. The Indianapolis Automobile Manufacturers' Association tour to the Pacific Coast starts July 1. This would not allow time after the run to Boston to get the cars back and in shape for the long, hard grind west.

A San Francisco, Cal., man has computed that the tires on his machine have had 10,500,000 chances to blow out. They are still in good condition after 3.5 years of use. His estimate is based on 7000 miles of European touring and 13,500 miles through California. By multiplying the mileage by the number of revolutions each wheel makes a mile he has arrived at his big total of blow-out risks.

CORRESPONDENCE WITH THE READER.

Examinations for License.

(1584)—What states, if any, require an owner of a motor car to pass an examination the same as a chauffeur?

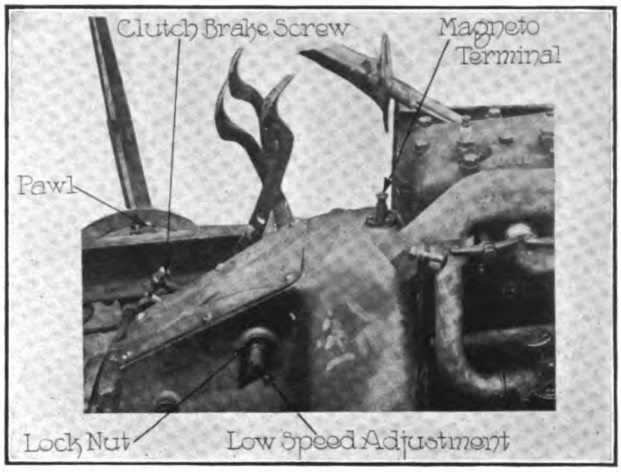
What is the meaning of a poppet valve and where derived? M. P. F.

Boston, May 11.

There is little uniformity in the provisions of the laws of the various states respecting the issuance of driving licenses. It would appear that only the states of Massachusetts, New Jersey and Rhode Island require both the owner and chauffeur to take the same examination. New Hampshire provides for the examination of both, but the wording of the law would indicate there was to be a separate and special examination for chauffeurs. Maryland calls for the examination of all operators between the ages of 14 and 16, and the secretary of state may require examinations for others. Connecticut permits the secretary of state to require an examination of either owner or chauffeur at his discretion. Chauffeurs are required to pass an examination in Illinois, Minnesota and New York, and the new law in Indiana, which goes into effect, July 1, makes the same provision. In Maine and Vermont, chauffeurs are required to give evidence of their qualifications.

The term poppet or mushroom valve is derived from its mechanical action, it being a lift valve and defined as a small member. It consists of a rounded or flat disc like head attached to a cylindrical shaft or spindle, called the valve stem, and having a seating in the head or port of the cylinder.

Adjustments to Ford Car.



(1585)—Noting that you supply information to owners I am availing myself of the privilege. I purchased a second hand model T Ford automobile which has given good satisfaction up to the present time. I am having trouble when the motor is running on the magneto, but not on the batteries. What is the cause? The low speed does not take hold; that is, the motor races when I use this speed. How is it remedied? When I use the emergency brake lever to secure a neutral position in going down hills the brakes take hold when the lever should be neutral, and the clutch is not entirely out. How can this be overcome? Sometimes the lever will jar out of place and let the high speed in. How can this be fixed? I do not possess an instruction book and would like to get one. Where can I secure the book? SUBSCRIBER.

Phenix, R. I., May 15.

The fact that the motor runs smoothly on the batteries indicates magneto trouble. It is probable that the magneto terminal spring in the transmission cover is covered with metal particles attracted from the crankcase. In the accompanying illustration is shown the terminal which may be removed easily and cleaned. This will doubtless cure the trouble. If not, the services of an expert will be required to test the magnets.

The low speed is easily adjusted. As will be noted by the illustration there is a threaded member extending from the crankcase and locked by a nut. Loosen the latter, turn the screw to the right and relock with the nut. If the speed fails to operate properly and further adjustment does not give the desired results, the transmission cover should be removed and the band examined. It may be worn so badly that a new one will have to be fitted.

The emergency brake lever trouble may be corrected by adjusting the screw member shown in the illustration. This is secured by a lock nut. By screwing the adjusting member in, the clutch

Showing Low Speed Adjusting Screw of Model T Ford and Clutch Brake Control.

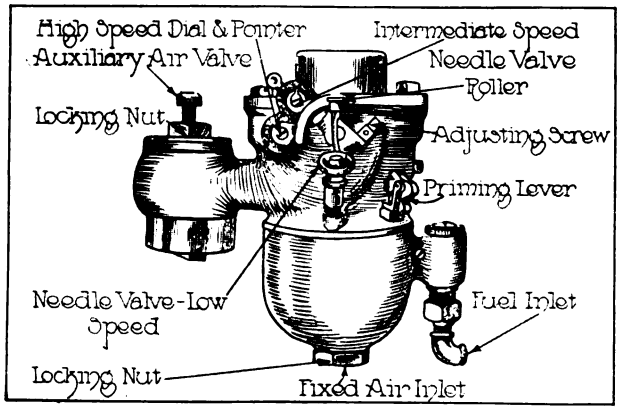
will be thrown out earlier or quicker. By changing the position of the screw the clutch can be moved to neutral without the brakes dragging. Any of the Ford agencies will supply you with an instruction book. Dutee Wilcox Flint, 17 Snow street, Providence, R. I., is the state agent.

Adjusting Schebler Carburetor.

(1586)—I have a Schebler carburetor on my car and there are two dials with pointers. I took the carburetor down to clean it and must have changed the adjustments in the work as it does not act right on any speed. If you will supply me with instructions I believe I can reset it.

A JOURNAL READER.

Willimantic, Conn., May 11.



The type of carburetor referred to with its components lettered is shown in an accompanying illustration. Three adjustments besides the air are provided, these being for low, intermediate and high speeds.. The first step is to set the low. Screw in the needle valve until it seats, being

Digitized by Google

careful not to exert pressure. Next turn it to the left about a turn and a half, and prime or flood the carburetor.

Open the throttle about two-thirds of its movement and close it slightly, retard the spark and start the motor. If the engine does not run smoothly change the low speed adjustment by means of the needle valve, cutting down or increasing the amount of fuel as may be necessary. To throttle down the motor, screw in the adjusting screw just above the needle valve member. This restricts the opening in the intake pipe by closing the butterfly valve.

After securing the desired adjustment on the low speed, the needle valve will not require further attention as the intermediate and high speeds are secured by moving the arms or pointers on the dials. The latter are provided with figures 1, 2, 3. First adjust the pointer on the intermediate speed dial by moving it from the figure 1 toward

Illustrating Components of Schebler Carburetor Utilized in Making Adjustments for the Various Speeds.

the figure 3, about half-way between these numbers. Next advance the spark and open the throttle so that the roller moving on the track like member beneath the dials is in line with the intermediate speed dial. The auxiliary air valve should seat lightly.

If the motor backfires with the throttle and spark lever in this position, increase the amount of fuel by moving the pointer toward the figure 3. If the mixture be too rich, which can be noted by watching the exhaust for black smoke, or by acrid or pungent odors, the pointer should be moved toward the figure 1.

The adjustment for high speed is made with the throttle wide open and in the same manner as the intermediate. In adjusting the carburetor in this manner there is apt to be a tendency of too rich a mixture and it is suggested that in making three adjustments, low, intermediate and high, the fuel be cut down until the motor shows signs of slight backfiring, then increase the supply until it operates evenly and smoothly. In utilizing the needle valve, turn it one notch at a time, and in setting the pointers on the dials, do not move these members more than half way. It is possible that although the motor runs perfectly when idle, a slight change may be necessary when under load. A slight variation of the adjustments should obtain the desired results. A lean mixture is to be preferred to a rich one as greater efficiency and economy will be possible.

It may be that in replacing the carburetor the gaskets do not fit tight and that auxiliary air is being taken in. This would cause irregular operation at low speeds and affect higher ratios, in that the mixture would have to be enriched at low to compensate for the extra air being taken in. Examine the gaskets, especially those between the intake manifold and cylinders.

Double Sets of Spark Plugs.

(1587)—I have a four-cylinder car with eight spark plugs. Most of the automobiles have only four. Can you explain the advantage, if any, of having eight?

A SUBSCRIBER.

New Bedford, Mass., May 17.

Eight spark plugs are utilized with ignition systems of the true dual or double type. One set is employed on the battery side and the current to the other is supplied by the magneto. Of course both sets could be used with two sets of batteries or two magnetos. In the system referred to the advantage is that either set of plugs may be used independently of the other, providing two separate systems. Usually current to the plugs on one side of the motor or over the exhaust valves, is furnished by a battery, and the other plugs are supplied by a true high-tension magneto. The advantage of such an installation is that in the event of one system failing to operate the other can be employed.

It differs from the dual ignition now in general use in that the circuit breaker of the dual system is utilized to interrupt the primary current and the distributor distributes the spark to the plugs, both when the instrument is generating current and when electricity is being supplied by dry cells or a storage battery.

Maker of Speedometer.

(1588)—Will you kindly inform or ascertain for me the name of the company making the Ever Ready Autocrat speedometer? It bears the name of the Auto Improvement Company, N. Y., but I have been unable to reach them, and would like to know what company is making it as I want a new front. W. F. D.

Bristol, R. I., May 10.

The name and address of the maker of the Ever Ready speedometer is the American Ever

Digitized by Google

Ready Company, 308 Hudson street, New York City.

Anti-Dazzle Lens.

(1589)—I noticed an article in a recent issue of your publication on an anti-dazzling lens. Will you kindly give me the name and address of the concern making the device or the company that is marketing it? Any information concerning same will be very much appreciated.

H. L. S.

Cleveland, O., May 8.

The lens referred to is made by Salisbury Lamps, Ltd., 124 Long Acre, London, W. C., England. The writer does not know of any company in this country handling the device. George Sumner, Inc., 1926 Broadway, New York City. has taken over the rights of the Diva headlight, another English product, a feature of which is the elimination of the anti-dazzling rays. Elsewhere in this issue will be found a description of the lamp.

Gasoline Gasket Material.

(1590)—As a subscriber to your book I wish you would kindly advise me as to what material to use as a gasket or washer in the gasoline strainer along the gas line assembly; that is to say, the gasket between the lid and the bowl of the strainer? We have tried leather and asbestos, both of which have been but a partial success.

R. S. S.

Bethelehem, Penn., May 9.

Cork is an excellent material as it is not affected by gasoline. Leather or asbestos is not suitable for the reason the fluid penetrates these materials. If a cork washer cannot be secured chamois might be tried or a gasket made of heavy paper or cardboard and treated with shellac or hard soap. Charles D. Brown & Co., 43 Federal street, Boston, markets a special gasket for this work called vellumoid, which is impervious to the action of gasoline, grease, etc., and which is not expensive.

Gobron-Brillie Motor.

(1591)—Kindly give me information regarding the Gobron-Brillie motor. What advantages a motor of this type (two-piston) has over the ordinary, or vice versa? Why is such a design not more popular? C. H. B.

Chicago, Ill., May 19.

The earlier forms of the Gobron-Brillie motors were designed by Frenchmen in an attempt to solve the vibration problem by mechanical means. One was a double-cylinder, vertical engine and the four pistons were actuated by a three-throw crankshaft. The cylinders were open at both ends, two oppositely moving pistons sliding in each, with the valves, ignition apparatus and compression space located midway in the length of the bore.

The lower pistons worked on one crank, and the two upper, through a crosshead bar at the top, upon two other cranks set at 180 degrees from the first. The result was that both cylinders had the out-strokes and in-strokes of the pistons simultaneously, the power stroke in one cylinder taking place with the suction stroke in the other.

According to some authorities the arrangement is exceedingly efficient in overcoming motor vibration, while the highest velocity of expansion is secured, the rate being nearly doubled, as compared with the ordinary type of motor. Of course the connecting rods between the upper pistons and their cranks must be twice as heavy as those from the lower pistons to their common crankpin. Structurally, the main advantage presented is that all joints are absent from the cylinders; hence no leakage is possible, as in some motors. The principle is incorporated in aviation engines.

The Gobron-Brillie aviation motor is of the inclined type, having eight cylinders. One design has a bore of 90 mm and stroke of 160. Another has a bore of 120 mm and stroke of 200. The stated number of revolutions of both is 1400, and weight 330 and 352 pounds respectively. The smaller motor is rated at 53.8 horsepower, the larger unit, 120. Both are water-cooled.

The last question is difficult to answer, being a matter of individual opinion.

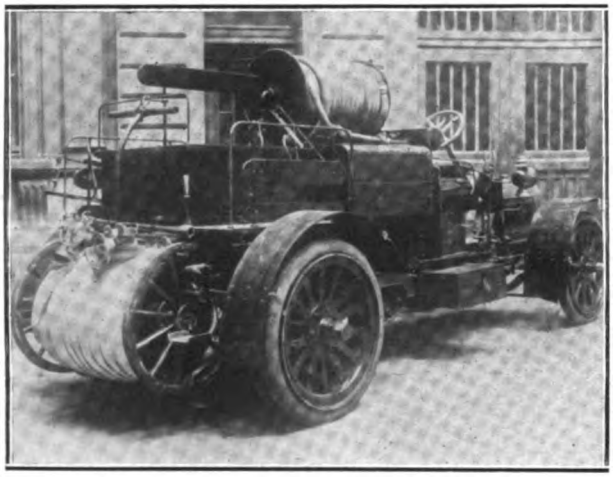
Dirt in Carburetor.

(1592)—I am troubled with dirt getting into my carburetor. The car is not fitted with a pan or shield, and I have to take the carburetor down and clean it every so often. I find that it is full of dust and when scraping carbon off the tops of the pistons found more or less dirt on these. As I do not care to go to the expense of fitting a pan, what can I do to prevent the entrance of the dust?

INFORMATION.

St. Louis, Mo., May 13.

More or less road dust finds its way into the carburetor and to the cylinders, especially where the air intake is not protected. The trouble may be overcome by fitting a tubing of the same diameter as the carburetor, 1.25 inches inside diameter for example, if that be the size of the vaporizer, and carrying the other end of the tube to a hood encircling the exhaust pipe or manifold. This will prevent to a great extent the entrance of foreign elements and will be an advantage in that the vaporization of the fuel will be accelerated. This method is largely employed on modern cars. The attachments and tubing complete may be purchased, being carried by any large supply house. One can be made, but the manufactured article would be more advantageous.



Several makers of carburetors manufacture hot air attachments which can be fitted easily and without alteration.

WITH THE MOTORING INTERESTS ABROAD.

Features of New Type of Fire Fighting Apparatus Recently Introduced in Paris—Motoring Permitted in Prince Edward Isle—Important British Conference.

THE fire fighting service of Paris, France, has undergone a complete transformation, automobile apparatus having entirely transplanted horses. Changes, however, are still taking place, the latest being that of installing what is known as first aid pumping engines. The city is divided into 12 sections, each having a barracks and stations, the company of firemen being quartered in the former, while the latter are served by a detachment from the barracks and relieved every 24 hours. The so-called regiment of firemen is under the command of Col. Cordier, who conceived the idea of restricting the larger pumping engines to certain stations and of supplying the others with the first aid apparatus. These are light ve-

Delahaye-Farcot Frst Aid Pumping Engine Used by Fire Department in Paris, France.

hicles, so designed as to reach the scene of blaze rapidly and extinguish the fire before it has attained serious proportions.

The chassis does not differ materially from the usual truck chassis produced by Delahaye. The pump was designed by Farcot. The same four-cylinder motor operates both. A reel of small hose carrying a nozzle 10 millimeters in diameter is located directly back of the driver's seat in the space sometimes occupied by the chemical hose in the combination wagons in the United States, and serving a similar purpose in a measure. This is connected with a reservoir, directly underneath, with a capacity of about 100 gallons of water. The size of the nozzle permits direct attack where the blaze commences.

When the apparatus reaches the scene of the fire a lever is so placed that the power of the motor drives the pump, which is a multiple-cylinder unit said to have a capacity of 7500 to 8000 gallons an hour. A suction tube is joined to a three-way valve, which permits the discharge of the pump into the reservoir, the suction of the pump and pipes from the reservoir, the directing of the pump onto the fire or the filling of the reservoir without the aid of the pump. The part played by the first aid apparatus is similar to that of the chemical engine, in that as soon as the vehicle reaches a fire the pump begins playing upon the blaze, utilizing the water in the reservoir until such time as the suction tube can be connected. It is estimated that this will be sufficient in at least one-third of the fires, while in a majority of others the first aid will be able to hold the blaze in check until the arrival of the larger pumping engines.

THREE DAYS A WEEK.

Automobiles Will Be Permitted to Enter Prince Edward Island This Year.

It was freely predicted in New Brunswick last summer that automobiles would be permitted to enter Prince Edward Island this year. It appears that the prediction was well founded, the legislature of that province having decided that motor cars may be operated three days a week—Monday, Wednesday and Thursday. Tuesday and Friday are market days, and it has not been thought best to permit motor vehicles to mingle with the horse drawn wagons on those days, and it does not appear that any special reason is assigned for eliminating Saturday and Sunday.

Several years ago a number of tourists visited Prince Edward Island, it being a matter of record that there were nine cars in all. Horses were so badly frightened that at its next session the legislature passed a bill excluding automobiles from the province. Last year a bill was introduced incorporating a company to manufacture cars at Charlottetown, and later permission was given to demonstrate machines on this company's private grounds. This year's law requires registration of

Digitized by Google

the cars, examination and licensing of the chauffeurs, and very stringent regulations to safeguard pedestrians and other users of the highways. The revenue will be devoted to maintenance of roads.

ONTARIO MOTOR LEAGUE.

Recent Affiliations Make It an Important Factor in Canadian Automobile Circles.

Eighteen automobile clubs in as many leading centres of population throughout Ontario, Canada, are now affiliated with the Ontario Motor League, and promise to do important work in furthering the activities of that organization in their respective districts. So extensive is the membership of the league that there is no city and practically no town in Ontario where several members are not to be found.

Motorists everywhere in Ontario are coming to a full realization of the importance of organized effort. The influence of a score of automobile clubs, comprising in their membership the leading citizens of as many towns and cities, is bound to prove considerable when all work together in such causes as that of good roads or sound motor vehicle legislation.

IMPORTANT BRITISH CONFERENCE.

Government Officials and Commercial Interests to Discuss Motor Transportation Problems.

During July an imperial conference will be held at London, England, to deal with the question of motor transport, including all the industrial uses of motor vehicles. Invitations have been sent to all parts of the Empire and it is hoped that the government departments of all the colonies interested in the development of road transport will be represented at the conference. Representatives of chambers of commerce, boards of trade, agricultural and planters' societies, municipal and road authorities and important concerns in the engineering and motor trades, will be present.

It is expected that H. R. H., Prince Arthur of Connaught, who is president of the conference, will receive the delegates July 18. The following day they will visit the industrial motor vehicle exhibition organized by the Society of Manufacturers & Traders, at Olympia. During the course of the conference the delegates will visit garages, depots, etc., where industrial motors are operated in considerable numbers. The following subjects will be discussed at the conference:

The question of fuel supply; present needs and future prospects; the possibility of creating adequate supplies within the Empire.

The consideration of the problems of imperial military motor transport with special reference to the production of types of vehicles, useful both for military work and for industrial work in the dominions and colonies.

The organization of motor transport systems for the carriage of goods, and their value to the mercantile life of the community. The adaptation of existing methods of delivery required to enable traders to take full advantage of the capabilities of mechanically propelled vehicles.

The relations between the British manufacturers and buyers overseas. Desirable arrangements for satisfactory supply, agencies, etc.

Road transport in cities. The carriage of passengers and the municipal uses of motor vehicles. Fire fighting and ambulance services. Postal services.

Rural transport and the uses of the motor to the agriculturist.

NOTES FROM FOREIGN LANDS.

Ninety per cent. of the automobiles used in Aguascalientes, Mex., and in that vicinity, are of American manufacture. Owing to the amount of quartz rock the life of tires is short.

The French government recently laid before the Chamber of Deputies a proposal to increase the automobile tax materially in order to raise more money for the upkeep of the roads. The plan calls for an extra annual duty of from $10 to $50, according to the horsepower. The industry is organizing a strong protest against the tax. It is estimated that about $1,600,000 yearly would be obtained by such means.

According to Auto, the organ of the German Society of Automobile Engineers, the German automobile industry during the last few years has experienced serious setbacks in its export business and its representatives in the foreign countries have ascribed the rapid and untoward change to American competition. An automobile show in Berlin at the earliest possible moment, preferably during the coming summer, is suggested as a suitable remedy and a means of averting a crisis.

An interesting reliability trial was held recently by the Canterbury Automobile Association, New Zealand, the route being from Kaikoura to Christchurch. There were 18 cars in the contest. In the open class the winner was W. B. Scott, who drove a Vauxhall car, made by an English firm. He was awarded the gold medal and certificate for reliability and also the first prize for the lowest gasoline consumption. Mr. Scott made a nonstop run and his gasoline consumption was 44 ton-miles and 29 car-miles a gallon.

The German Imperial Automobile Club, in conjunction with the German Society of Motor Manufacturers, recently held a series of comparative road tests of gasoline, heavier spirit and benzol. The trials lasted nine days and the cars were divided into three groups, so that on each day the three different classes of fuel could be in use. Thus the group using gasoline on the first day used heavy spirit on the second and benzol on the third. Those entering cars were allowed to provide three separate carburetors for use with the different classes of fuel, or, in the alternative, they might use and adjust a single carburetor. The trials were conducted not so much as a competition between rival systems as for the purpose of procuring data of the relative consumption and cost of the different fuels.

According to United States Consul Edward J. Norton at Bombay, India, it is quite practicable to cover a large part of that country by automobile. He reports that a party recently left Calcutta in a 30 horsepower, four-cylinder Studebaker car, made by the Studebaker Corporation, Detroit, Mich., on a journey of 1472 miles, which included the following points on the most practicable, direct route: Mhow, Jhansi, Cawnpore, Allahabad, Benares, Delhi and Calcutta. In laying out a northern tour it is believed that the most desirable route could be found by leaving the Bombay-Calcutta road at Cawnpore, going thence to Lucknow and Agra. Side trips can be made to Gwalior, Delhi and other places and the journey continued with many detours as far north as Peshawar. The best touring season is from October to March.

MECHANICAL NOTES FOR OWNERS.

Timing the Valves of Model T Ford Motor---Adjusting Mechanical Lubricators---Treatment of Slipping Cones---Handy Wire Stripper---Starting Small Screws.

TIMING the valves of an internal combustion motor is not a difficult task and as the efficiency of the engine depends largely upon the correct opening and closing of these members it is important that they be given proper consideration. Valves are timed correctly at the factory, but after considerable service the stems and pushrods will wear, causing the valve to open late and to close early, thereby decreasing the power of the motor. When this condition exists the remedy is to retime the valves.

There are two methods, one by utilizing the marks on the flywheel, and the other the piston travel. The latter plan is employed in resetting the valves of the model T Ford car and in an accompanying illustration is presented a timing diagram, the opening and closing points for the intake and exhaust members being shown.

Adjusting Mechanism of Lubricator on Overland.

As the work involves the removal of the cylinder head it will be an excellent plan to examine the valves and grind these before checking up the timing. Assuming that this has been done, the first step is to check the timing of the intake valve of the first cylinder—that nearest the radiator.

As will be noted by the diagram at A, the intake valve opens .125-inch past top dead centre on the completion of the exhaust stroke of that cylinder. It should be borne in mind that there are four strokes to each cylinder, these being intake, compression, firing and exhaust, in that order. Consequently, in timing the intake valve of the first cylinder it should open when the piston has completed one-eighth of the downward stroke or piston travel. As the stroke of the piston is four inches this is a simple case of mathematics.

The intake closes one-quarter past lower centre, or in other words, the piston has completed the intake stroke and has begun the compression stroke as shown at B. With the piston in this position the valve should be on its seat with a suitable space between the valve stem and pushrod or tappet as illustrated in the drawing.

The timing of the exhaust valves is accomplished in a similar manner. The exhaust opens one-quarter before the piston reaches lower dead centre as shown at C and closes on top dead centre as illustrated at D. The valves of each cylinder should be timed separately.

The clearance between the valve stem and the pushrod should never be greater than .03125 inch nor less than .015625 inch. If the space is too small the valve is likely to remain partially open, causing faulty operation of the motor. It should be remembered that there is more or less expansion of the metal when hot and this should be taken into consideration in making fine adjustments, and when lengthening the stems or fitting new pushrods.

As the valve mechanism is not adjustable the valve stems will have to be lengthened when too short. This involves drawing them out just above the hole into which is fitted the pin retaining the spring collar. Care should be exercised in the work as it is an easy matter to bend the stem. A simpler method is to fit the Apco valve stem adjusters, made by the Providence Auto Parts Company, Providence, R. I. These devices are constructed especially for the work and are attached easily, being slipped over the stem.

The sketch at E will be of service in replacing the camshaft if this member has been removed in the overhaul or in case of trouble. As the crankshaft and camshaft gears are marked, it is a simple matter to remesh them. If either is broken so that the mark has been destroyed the gear should be replaced so that the cam and piston occupy the positions shown in the drawing. The first cylinder is utilized for this timing. As the direction of rotation of the crankshaft, cams, etc., is shown in the drawings and the stroke of the piston defined by arrows, one should not experience any difficulty in retiming the valves.

Oily waste should not be allowed to remain in the garage unless stored in a suitable container, owing to danger of spontaneous combustion.

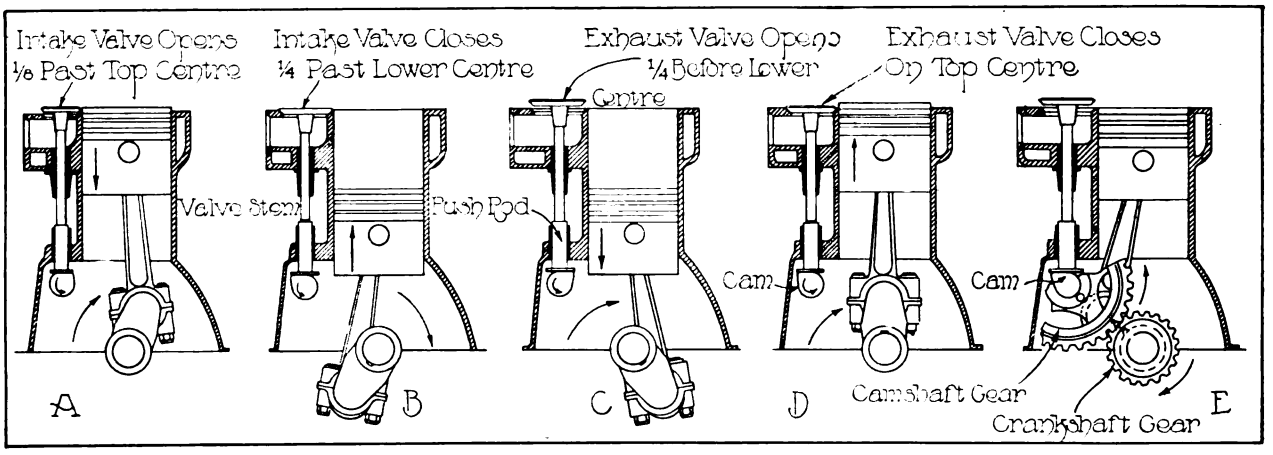
Digitized by Google

REMEDYING SLIPPING CONES.

Some of the older types of cars are fitted with ball bearings which are adjusted by moving the outside cone on the spindle toward the hub. When the small cone has been replaced a number of times the spindle becomes worn and the cone does not fit snugly, resulting in its rotating with the wheel. This condition not only produces friction, but wear of the spindle and adjusting nut follows. When it is found that the cone is slipping it may be cured by taking a small cold chisel and nicking the spindle so that a drive fit of the cone is secured.

STARTING SMALL SCREWS.

Small screws are difficult to start, especially when located in places not accessible with the fingers. A small wire, bent double at one end and slipped under the head of the screw will hold the latter steady while the threads are being caught. Another method is to cut a V slot in a small strip of tin. This plan is recommended because the device will take several sizes of screws. Another suggestion is to take a piece of stiff paper and push the screw through it.



ADJUSTING MECHANICAL OILERS.

The practise of increasing the amount of oil fed to the working parts of the motor after an overhaul or adjustment of bearings is to be recommended. With the type of lubricator shown in an accompanying illustration, and used on the model 69 Overland car, means are provided for augmenting the supply or reducing it as desired.

When the bearings have been taken up it is a good plan to increase the amount of lubricant until they are worked in, after which the setting may be returned to its original position. The operation of the oiler is mechanical, a cam raising and lowering a plunger, which forces the lubricant past a check valve to the working parts. As the amount of oil forced depends upon the stroke of the plunger, this member is made adjustable.

The variation of the stroke is accomplished by restricting or increasing the movement of the yoke member, and an adjusting nut secured by a lock nut is provided for this purpose. To decrease the amount of oil the adjusting nut is screwed down, diminishing the quantity of lubricant, while raising or lengthening the stroke increases the amount.

The oiler is very efficient and the only trouble likely to be experienced is through clogging of the feed pipes. This can be avoided, however, if one be careful to utilize a clean oil, one free from foreign elements. A clogged pipe is indicated by the plunger remaining up or stationary. The obstructions can sometimes be removed by operating the plunger by hand. When the oiler is set temporarily to increase the amount of lubricant, in cutting down the quantity, care should be taken to make the adjustment so that the proper level will be maintained in the crankcase. This can be determined with a little experience.

Illustrating Timing of Valves of Model T Ford by Position of the Piston and Its Travel, Also Showing Method of Replacing Camshaft and Meshing the Gears.

WIRE STRIPPER.

In stripping wire of its insulation one is apt to cut into the strands. An excellent tool for this work is a clip, such as utilized for cutting the finger nails. One that has seen considerable service is best adapted to the work.

THE GUESTS OF THE INDUSTRY.

During the next 20 days it will be the privilege of the American automobile industry to assist the Society of Automobile Engineers in entertaining members of the Institute of Automobile Engineers and the Society of Motor Manufacturers & Traders of Great Britain. The event is one of decided importance, as indicating the friendly relations existing between the representative bodies of the two countries.

The entertainment programme has been arranged to afford a wide diversity, including not only the official midsummer meeting of the American society, at which papers will be presented by the British engineers, but abundant opportunity to inspect many of the largest plants in the industry and in lines closely allied therewith. It is proper to assume that the visitors have elected to come to America for the purpose of studying American methods at first hand, and the industry of this country greets them with a cordial welcome.

The splendid development of the automobile industry in America is a matter for pardonable pride on the part of Americans, but it hardly will be contended that it has yet reached the point where there is nothing further to be learned. The British engineers and manufacturers can bestow as much information as they can absorb, and it would prove extremely unfortunate if full advantage were not taken of this opportunity for an exchange of opinions and methods.

CONCERNING RECKLESS DRIVING.

The legislative season now drawing to a close has devoted considerable attention to the reckless driver, many states having enacted more stringent laws covering this point. The menace is one which affects all users of the highways—other motorists as well as pedestrians and occupants of horse drawn vehicles—and is one in which the majority of automobilists are as deeply interested as the others.

But, as is quite often the case in other fields, it is an open question whether there is need for additional legislation. The conviction of a reckless chauffeur by a Chicago jury, four members of which were motorists, and the subsequent sentence of 14 years, is sufficient indication in itself, not only of the position held by motorists, but of the possibilities under existing laws.

The trouble has been in the past that many of those upon whom has devolved the duty of seeing that laws were enforced have been more intent upon maintaining speed traps, which have resulted in the apprehension of those who were but slightly exceeding the law's provision rather than in the arrest of those guilty of recklessness. It need not be contended that the former should be entirely overlooked, but it would seem that there might be greater activity in reaching the real offenders. And it may be added that the courts have a certain responsibility as well.

Public opinion is a valuable asset in any field of endeavor, and the motorist must appreciate its effect in solving the good roads problem. Successful agitation by automobile owners and users has done much, but as yet little more has been accomplished than to demonstrate the need. There is still the subject of ways and means.

OVERHAULING THE MOTOR CAR CHASSIS.

Describing the Construction of Components Subject to Wear and Method of Inspection and Restoration---Suggestions for Facilitating the Work.

(By C. P. Shattuck.)

COMPONENTS of the motor car other than the power plant need attention and much of the work may be performed successfully by

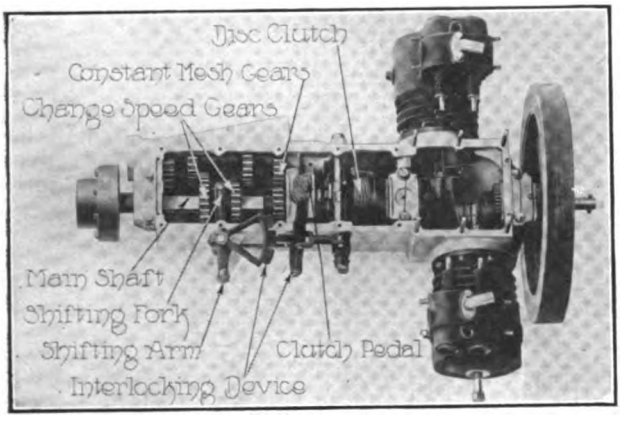

Fig. 1—Conventional Type of Multiple Disc Clutch and Transmission and Parts Requiring Attention.

the owner. There are a number of small jobs which require time rather than experience, and some involve tasks entering into the regular routine, such as adjusting the clutch and brakes, replenishing the supply of lubricant, etc. While the mechanism may appear complicated to the novice, it is simple, and by studying the principles involved not only will considerable beneficial knowledge be obtained, but much economy will be effected.

Although there are a number of repairs which should not be attempted by the inexperienced, there is no reason why the greater part of the work cannot be undertaken, this depending of course upon the condition of the car, etc. While the suggestions contained herein may be familiar to some they will be of value in that they will serve to facilitate the overhaul. Several of the groups of components are shown disassembled and with the steps illustrated in sequence.

It is assumed that the motor has been placed in first class condition and is in the chassis. The next step is to inspect the clutch, which may require only cleaning and adjusting. If it be of the multiple disc type with the plates operating in lubricant, similar to that shown at Fig. 1 for example, it should not be disassembled unless one is familiar with the work or under the supervision of a competent workman. Even if the parts are in good condition the old oil ought to be removed and the plates and housing flushed with kerosene. Remove the plug under the casing and drain off the old lubricant, after which use plenty of kerosene. With the clutch out spin the starting handle to flush the plates, also let the clutch in and throw it out several times. After draining off the kerosene inspect the clutch, collar, yoke, etc.; adjust the spring if necessary and refill with the lubricant recommended by the maker. If the clutch has been giving trouble and cleaning and adjusting fail to secure results, it may be necessary to call in the expert and have the discs examined for burrs, etc.

The design of clutch shown at Fig. 5 differs from the one previously mentioned in that the plates are alternately of bronze and steel, the former carrying 64 cork inserts, which come in contact with the steel members. The cork is filed smooth with the metal, but upon being subjected to the oil bath in which the clutch operates, the material distends beyond the surface of the bronze. As with the plain disc type it is necessary that the plates be cleaned and new lubricant

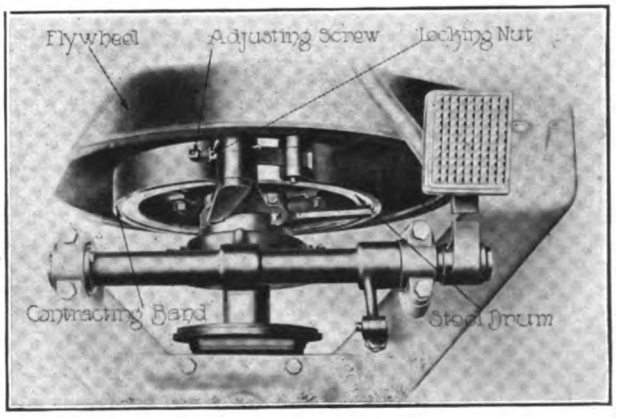

Fig. 2—Showing Contracting Type of Clutch and Method of Adjustment.

utilized. The method of assembly, as well as adjustment, is outlined in the illustration.

There are various forms of clutches and at

Digitized by Google

Fig. 3 is shown one in which the flywheel carries 16 coil springs, which exert a powerful pressure against a driving plate and the energy is transmitted by a driven plate, which carries a number of cork inserts. This is a three-plate clutch, which does not operate in oil.

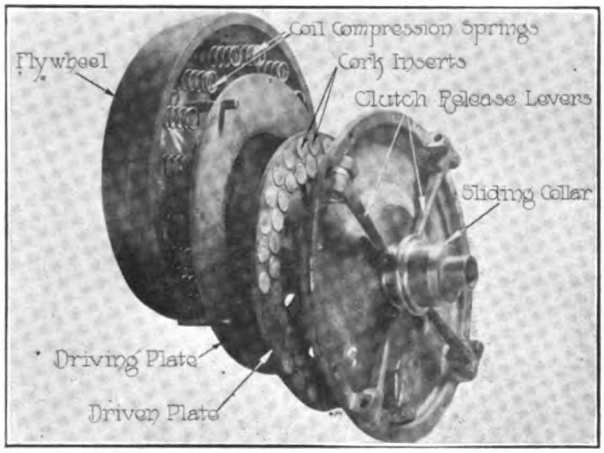

Fig. 3—Three-Plate Dry Disc Clutch Having Cork Inserts and Coil Springs.

The clutch shown at Fig. 2 is of the contracting band type and consists of a heavy steel band which encircles a large steel drum. When engaged the band grips the drum throughout its entire circumference, and when disengaged, the drum rotates free. The contraction and expansion are accomplished by a wedge shaped shipper head. This type is easily adjusted, by loosening the locking nut and setting an adjusting screw.

The design at Fig. 4 is of the leather faced cone type. The male member is forced into contact with the flywheel by three clutch springs carried on studs and the tension of the springs is regulated by an adjusting nut. Screwing the latter up increases the tension. While there are a number of other types of clutches the principle on which they operate is similar to those outlined, and by studying the arrangement of those illustrated one should not experience trouble in making any needed adjustments.

Dealing first with the plain type of leather faced cone clutch: Two points are subject to wear, the facing and the bearing surface of the male member where it revolves on the shaft. It is possible that the clutch has been slipping and that treating the face with oil has not cured the trouble. If the operator has made it a practise to slip the clutch it may be found that the facing is worn to the heads of the rivets. It may be that the leather is in such poor condition that a new facing is necessary. While a piece of leather may be prepared, treated and fitted, it is best to procure a new facing from the maker. In fitting it the heads of the rivets must be well countersunk.

When the clutch slips and the leather has been treated too freely with oil, thereby reducing the co-efficient of friction to a low point, and the pressure of the spring is not sufficient to maintain the parts in frictional engagement, the surplus lubricant must be absorbed. Fuller's earth, well rubbed into the surface is recommended, but if the clutch is not to be removed, the material may be inserted by using a small bellows or a blow gun.

A harsh or gripping clutch should be remedied as its failure to yield exerts undesirable stresses upon the driving components of the chassis. Treating the facing with neatsfoot oil to render it soft and pliable will usually remedy the trouble. In some types of leather faced cone clutches springs are fitted under the facing to make for easy and gradual engagement. When the clutch bites and the leather is in good shape it is possible that the springs are not adjusted properly; that is, they do not lift the facing.

In the examination of the clutch the bearings should not be overlooked. If worn the male member will have a tendency to drag and if this condition exists it will explain the reason for the difficulty experienced in changing speeds. If a clutch stop is fitted, it may require resetting. The thrust bearings are equally important in the proper operation of the clutch and these members should be cleaned and fresh lubricant utilized.

Faulty clutch action may be due to a number of conditions existing outside of the clutch,

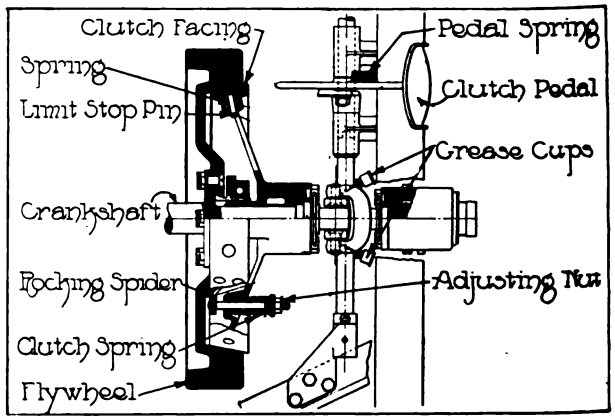

Fig. 4—Illustrating the Leather Faced Cone Clutch and Components Needing Inspection.

such as wear of the various operating parts. Worn or improper adjustment of the linkage, including levers, rods, shifting collars, pins, etc.,

Digitized by Google

often hinders disengagement, and sometimes the wear is so pronounced that a complete depression of the pedal does not wholly disengage the

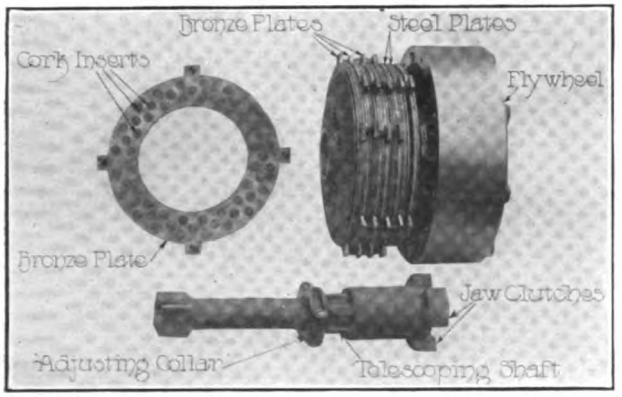

Fig. 5—Multiple Disc Clutch with Plates Having Cork Inserts and Operating in Oil.

clutch. As the type of control varies it is not possible to give other than suggestions for inspection. By carefully studying the design and following the instructions of the maker as to adjustments, faulty operation may be corrected.

Aside from a very thorough cleaning and inspection the writer does not advocate that the novice attempt repairs to the transmission, either the sliding gearset or the planetary. The parts of the former may be examined by removing the old lubricant and washing the components until all foreign elements are removed. It will then be a simple matter to note if the gears are worn badly, the bearings snug and the shifting mechanism in order. The change speed lever can be utilized and the meshing of the gears watched to note if they slide by each other freely and easily. If not the expert should be called in. If the transmission is in good condition all that will be necessary will be to renew the supply of lubricant.

Although a large majority of cars are equipped with the sliding gearset, there are a number of machines fitted with the planetary or epicylic type of transmission. These are easily cleaned and adjusted, the friction being secured for the low and reverse speeds by means of contracting bands. These should be examined for undue wear and if needed, new bands fitted. In inspecting the transmission the high speed plate should be cleaned as sometimes slipping of the clutch is due to the plate being cracked. In adjusting the low and reverse speed bands care must be taken not to have these members bind. This can be determined by cranking the motor with the spark off and brakes released. If the machine "crawls" it may be assumed that the bands are too snug. This means lost power as well as worn facings. As with the other forms of transmission the housing containing the gears should be cleaned and refilled with fresh lubricant. The linkage of the planetary type is subject to wear and means are usually provided for taking up lost motion.

The overhaul of the rear system will depend upon the age of the car and its condition. Owing to the different designs it is not possible to give complete instructions and the owner will have to be guided by the construction. When the rear axle is of the full floating type it is an easy matter to disassemble the driving and driven components and without jacking up the rear of the chassis. On the other hand, with other designs, it may be necessary to disconnect the rear springs and jack up the frame before attempting to disconnect the universal joints, etc.

The front wheel should be blocked to prevent rolling of the chassis. If the garage be equipped with a falls and tackle the work will be simplified. If not, jacks will have to be employed. Disconnect the spring clips at the top or bottom half of the springs, depending upon the design, also the brake rod connections. If possible place a piece of joist under the frame, utilizing a jack at each end of the wooden member. The chassis should be lifted gradually and care must be taken that the jacks are balanced. After the universal joints and radius rods are disconnected, the rear system may be rolled out and the jacks reinforced by placing heavy boxes under the rear cross frame member. This will prevent damage in the event the jacks slip and will also safeguard the

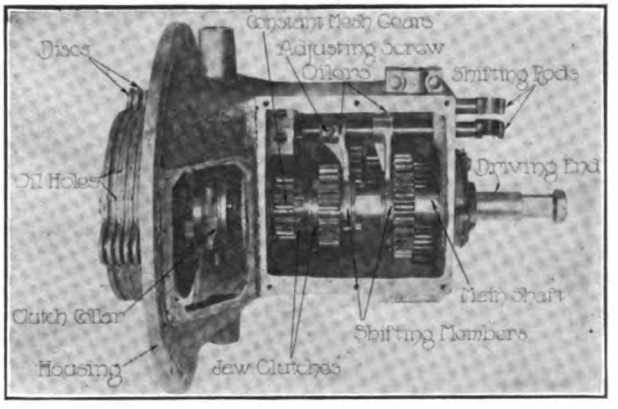

Fig. 6—Components of Sliding Gearset, Multiple Disc Clutch and Operating Mechanism of the Latter.

workman when obliged to get under the car.

Before disassembling the rear construction remove the drain plug under the differential cas-

Digitized by Google

ing and allow the lubricant to run out, for if it be in a fluid state the separation of the casing will flood the floor with dirty lubricant. Before un-

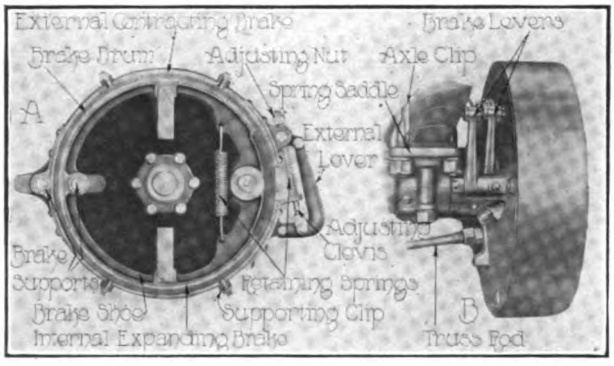

Fig. 7—Conventional Types of Brakes: A, Illustrating External Contracting and Internal Expanding Designs and Parts Requiring Inspection; B, Enclosed Type and Brake Levers, Etc.

bolting the halves of the housing place it on supports so that it will be relieved of undue strains. It will also be found that the work of removing the bolts will be simplified by this arrangement.

At Fig. 10 will be noted full floating constructions with the driving groups clearly outlined. That at A is a conventional design and is shown with the hub cap displaced and the axle shaft partially withdrawn to illustrate the operation of removal. It will be seen that the drive is imparted from the jaw clutch of the axle to that on the hub of the wheel. That at B is similar in design and the parts are entirely disassembled to show their construction. The type illustrated at C is on the same principle, differing only in the method of retaining the axle. It will be seen that the driving member is secured to the flange and that the latter is bolted to the wheel proper. An advantage claimed in this construction is that opportunity for lost motion or wear of jaw clutch is eliminated. The axle is removed easily by displacing a few nuts, after which the axles are withdrawn without jacking up the car.

A feature of the full floating design is that the differential may be taken out easily and Fig. 8 illustrates the steps in alphabetical order, which if followed will simplify the work. If the car has been in service for some time it is an excellent plan to disassemble the differential, clean and inspect it. The reassembly can be accomplished by reversing the order of the letters. As previously pointed out, the method of overhauling the axle will depend upon the design. The drive shaft should not be overlooked, or the universal joints. The latter should be cleaned and the bearings examined and if too much play exists the elimination of the lost motion will require the services of a machinist or expert. The end thrust bearings of the drive shafts will also require attention and the shaft should be tested for longitudinal as well as side movement. The majority of machines are fitted with means for adjusting these parts and in the reassembly care must be taken in meshing the driving gear with the driven or crown gear. This is a delicate task and it may be necessary to make several alterations before the gears run quietly. They should not bottom nor be too far out of mesh, or the humming noise will be in evidence.

Torque tubes and radius rods are important factors and when the latter are employed they should be given a careful inspection to make sure that undue play does not exist. Their adjustment requires care and one should not be subject to more stresses than the other. As with the clutch there are varying types which will require different treatment.

Too much emphasis cannot be laid upon the attention to be given the brakes and their actuating mechanism, especially with the sliding

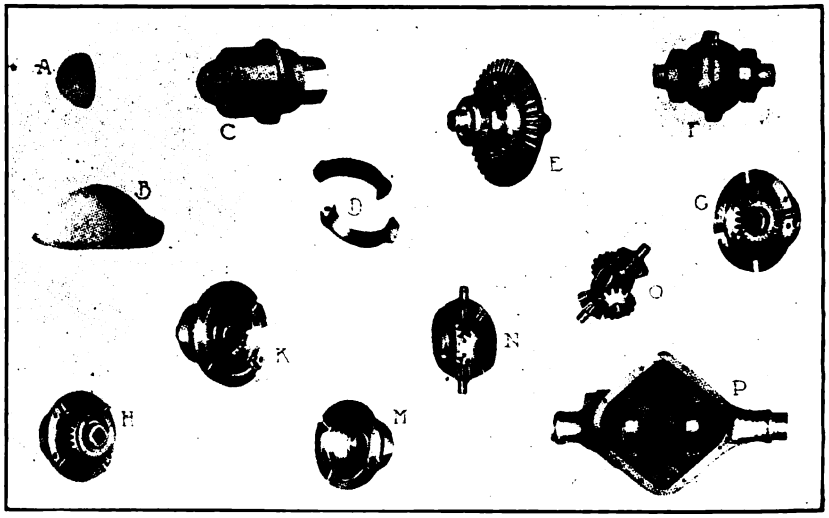

Fig. 8—Showing Steps in Disassembling the Differential—To Reassemble Reverse the Alphabetical Order.

type of gearset. As the operator must rely wholly upon them and, unlike with the planetary type of transmission, cannot resort to the use

Digitized by Google

of the reverse in an emergency, it will be seen that the overhaul of the braking system must be carefully and thoroughly supervised.

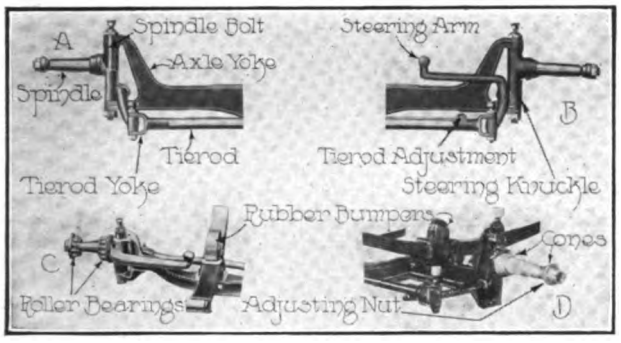

Fig. 9—Front Axle Assembly and Parts Subject to Wear: A, Steering Knuckle Cut Away to Show Bolt; B, Adjusting Devices for Aligning Wheels; C, Conventional Type of Roller Bearings; D, Cones Employed with Ball Bearing Wheels.

Brakes are divided into two classes, contracting and expanding, and in the majority of cases are fitted to the rear wheels, although the drive shaft is utilized by some makers for the service brake. The external contracting type, such as shown at Fig. 7 A, is favored by many makers for the service member and an internal expanding member is utilized for the emergency. With the first named design the components and actuating linkage are readily accessible and may be disassembled easily. The various parts, including the adjusting mechanism, are outlined in the illustration and the operation should be understood easily with a little study.

To examine the internal brakes the wheels will have to be removed and the old lubricant cleaned out before the cams, springs, etc., can be inspected. The cams may be worn and require new members; the springs may have lost their tension, permitting the brakes to drag, or the linings be worn so that the heads of the rivets are exposed. The method of repairing and relining brakes was discussed and illustrated in the Feb. 25 issue. Before leaving the brakes their levers should be examined and if the pins are badly worn new ones fitted. If the design is similar to that presented at B the grease cup will need cleaning and refilling with fresh lubricant. Truss rods are important, reinforcing as they do the rear axle, and these members should be snug, not too tight, else they are likely to break. In connection with the rear axle should be mentioned the advisability of replacing old felt washers with new, especially if there has been a tendency toward leakage of lubricant around the axles into the brake drums. In replacing the hub caps pack with grease, but do not use so much that the cap cannot be screwed home, otherwise a loss of the cap may follow.

The spring saddles, clips, etc., should be gone over and if the threads of the nuts or retaining members are damaged through lost motion or careless handling, fit new. Clean and lubricate the springs. There is an inexpensive tool marketed for separating the leaves, which should be thoroughly cleaned and their faces treated with a lubricant. The writer prefers graphite, as it fills the pores of the metal and reduces friction to a minimum.

The overhaul of the steering gear and its linkage should be very thorough. While a slight amount of wheel play is permissible it should not be excessive, neither should there be any longitudinal movement. The mechanism is tested easily by rotating the wheel and noting the amount of lost motion. A conventional type of steering gear is shown at Fig. 11, and the components are illustrated individually. With this design it is possible to reduce any lost motion by changing the position of the worm gear in its relation to that of the worm. The worm gear shaft is squared at one end and has a groove cut in each corner to take the ball steering arm. The

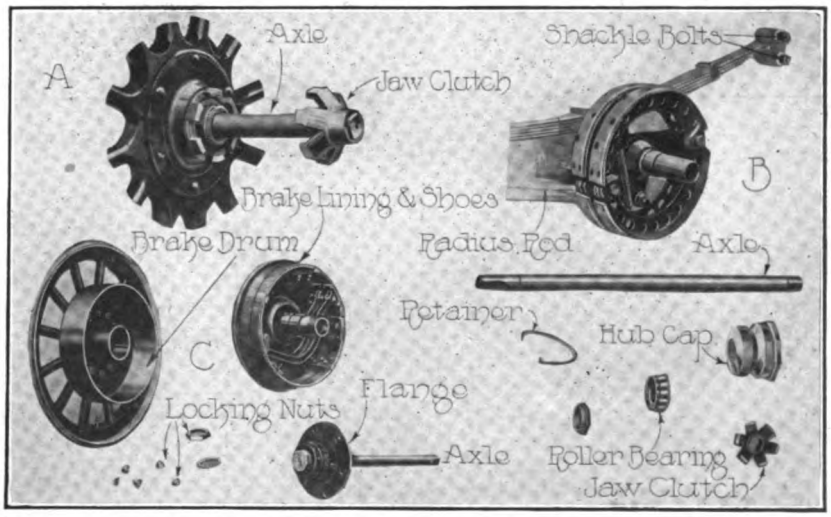

Fig. 10—Rear Axle Construction: A, Full Floating Type with Jaw Clutch; B, Similar Design with Axle, Etc., Removed; C, Illustrating Method of Retaining Axle by Flange Bolted to Wheel.

Digitized by Google

parts are secured by a clamping screw, which permits the turning of the worm gear a quarter of a turn, thus bringing a new section of the gear into mesh. Longitudinal movement is restricted by the adjustment of the thrust bearings. In reassembling the components be sure that each nut and bolt is set up snugly and that the usual lock washer is in place. Repack with grease in accordance with the instructions of the maker.

Next examine the drag link. This may be the source of some of the lost motion and as these members are usually adjustable, remove the cotter pin and adjusting plug, clean out the lubricant and repack with new before replacing the adjusting member. Another cause of play in the steering linkage is due to the tierod connections, the bolt and bushing being subject to wear. The fitting of new bushings and bolts will eliminate the trouble, after which the wheels should be aligned. This is accomplished by loosening the clamp device shown at Fig. 9 B and lengthening or shortening the tierod as is necessary.

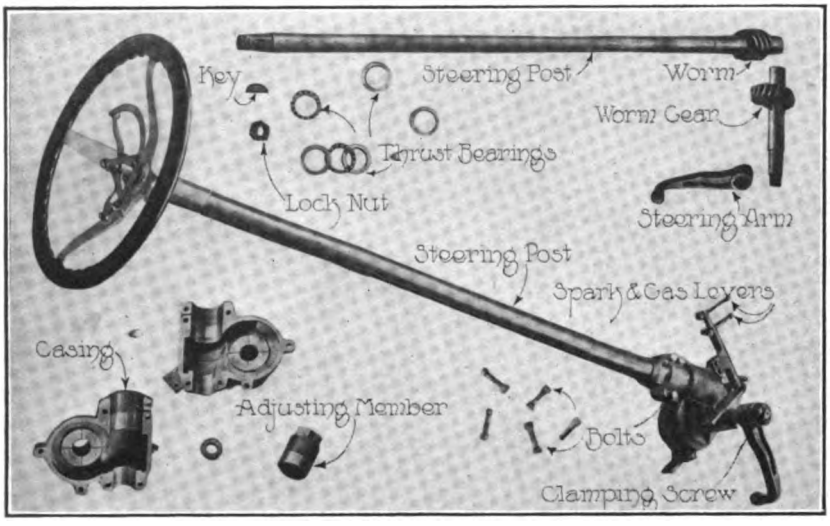

Fig. 11—A Typical Steering Gear and Its Parts—Lost Motion Is Eliminated by Meshing Unworn Part of Worm Gear with Worm.

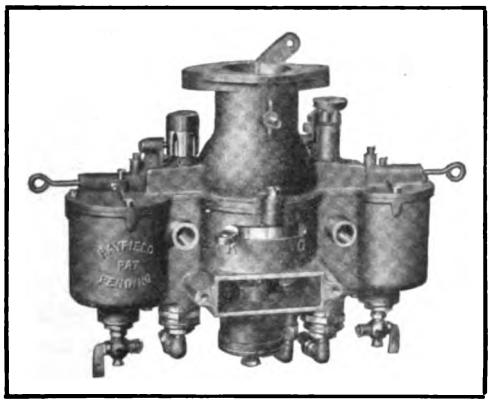
Remove the spindle bolts and clean out the oiling grooves and holes, and if the bushings, are worn replace with new. Also use a new pin if the latter shows signs of wear. By moving the bolt around slightly some lost motion will be eliminated.

If the front wheels are fitted with ball bearings, remove the wheels, and clean the races, cones and balls. Examine these parts carefully for wear and if one or more of the balls are worn replace with a complete new set. Observe the same treatment with the cones, and in replacing the bearings, repack with a high grade grease, one free from acid. In adjusting the bearings tighten up until they appear to bind, then slack off about half a turn and lock. Try the wheel to see if it revolves freely, as it may bind at one section. If it cannot be adjusted examine the spindle. It may be possible that the latter is bent. Roller bearings are adjusted in a similar manner. Clean and refill all grease cups and replace worn boots with new, repacking same with grease.

Before testing out go over the chassis and try all nuts and bolts to make sure they are snug. If the tires have been removed, as they should have been, clean the rims and either paint or graphite them. There is a graphite paint on the market made especially for this work. The chassis should be tested out before replacing the body, as it permits of the changing of any adjustment or tightening of parts not easily accessible with the body in place. Before fitting the body go over the nuts and bolts a second time as some will be found that will permit of tightening.

Before going out on the road with the chassis make sure that the crankcase is supplied with plenty of lubricant and that the oiler is full. If the bearings have been taken up it is a good plan to adjust the oiler to feed more than the usual amount until the bearings are run in. The road trial is recommended as it affords opportunity to readjust the carburetor, test the brakes and to make a number of minor adjustments which are usually needed. Before going out it is advisable to note if the license plates are attached as in some states the law covering these members is strictly enforced. In the replacement of the accessories, such as lamps, speedometer, horn, etc., these members should be cleaned and inspected if the work was not previously performed.



As a reward for her services in obtaining the conviction of leaders of a band which for two years has defrauded dealers in automobiles and tires, Miss Margaret M. Burnet, an attorney of 2 Rector street, New York City, has been made secretary of the Automobile & Accessories Dealers' Protective Association.

NEW RAYFIELD CARBURETOR.

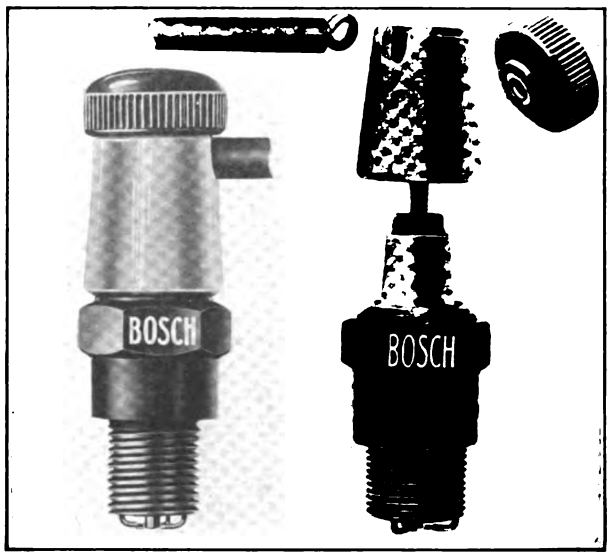
Combination Vaporizer Utilizing Gasoline or Kerosene Independently.

Announcement is made by the Findeisen & Kropf Manufacturing Company, Chicago, of a new combination Rayfield carburetor. It is the invention of Chas. Rayfield, who also designed the conventional Rayfield carburetor, and is for use on traction, stationary and marine engines, although it is understood that the inventor is conducting a series of experiments with a similar instrument applicable to automobile motors.

Rayfield Combination Kerosene and Gasoline Carburetor.

The operation of the new carburetor is automatic, and it is held that a perfect mixture is supplied to the cylinders at all speeds and under varying loads when using kerosene, distillate or other low grade fuels. Water is automatically fed with the kerosene.

As will be noted by the accompanying illustration, two float chambers are employed. The shifting of a small lever by the operator shuts off the supply of gasoline and opens the kerosene port, instantly changing the mixture from one fuel to the other. Two separate adjustments are provided. The required heat for vaporization is obtained from the exhaust manifold, a pipe connecting the latter to the air intake of the kerosene member.



BOSCH SPARK PLUG HOOD.

Simple and Easily Attached Device for Preventing Short Circuits, Due to Moisture, Etc.

The tendency of a high-tension current to stray from its intended path is augmented when terminals, such as those of the spark plug for example, are exposed to dampness or moisture. Water is a well known conductor of electricity and during heavy rain storms the spark plugs are subjected to moisture unless the hood of the motor is water tight. To prevent short circuits and to protect the plug as well, the Bosch Magneto Company, New York City, has perfected and is marketing a hood which is easily and quickly attached or removed, and without interfering with the usual plug.

The spark plug hood is shown in an accompanying illustration and comprises but three parts, the hood, asbestos washer and an insulated terminal thumb cap. To apply it the usual plug terminal is removed and the asbestos ring pressed into the groove at the base of the hood, after which the latter is slipped over the regular plug. The cable is then set in the recess of the hood with its terminal over that of the electrode or central pin of the plug. The insulated thumb cap is next screwed in place, it not only serving to retain the parts, but its large inside diameter bearing against the insulation of the cable, expanding it sufficiently to seal the opening. The hood is of steatite.

The construction of the hood is such that the parts carrying the high-tension current to the gap of the plug or ground side of the shell, are insulated, and it would be possible to obtain perfect ignition even if the hood were subjected to a stream of water. A feature of the device is that the cable may be detached with the motor operating, and without danger of shocks, by removing the thumb cap. The hood may be displaced and reassembled by the fingers and locking as it does the connections, makes for convenience. It is made in all sizes for Bosch plugs, including those for motorcycles.

Bosch Spark Plug Hood, a Practical and Simple Construction for Completely Insulating High-Tension Current Carrying Parts of Spark Plug.

MOTORING LAWS AND THEIR ENFORCEMENT.

Provisions of Amended Law in New York State---What Maine Is Doing for Good Roads---Special Registration Fees for Trucks---Legislative Briefs.

AFTER Jan. 1, 1914, under the provisions of the new motoring law passed by the New York legislature, all automobile operators, whether chauffeurs or not, must be licensed. Only chauffeurs will be required to pass an examination, however. The license fee is made $1 a year instead of $5, as at present.

Although several automobile bills were introduced early in the session, the new statute amends the so-called Callan law in only a very few particulars. The most important of these, aside from the provision for licensing all operators, is found in the new section 291, which reads as follows:

Suspension and revocation of a certificate of registration and license of operator—The secretary of state may suspend any certificate of registration, or any license, issued to any person under the provisions of this article for any one of the following causes: a, for a third violation of the speed provision of this article within one calendar year; b, upon the conviction of the holder of a license of a felony under this act; c, because of some physical or mental disability of the holder arising since the original issuance of the license or its renewal, or the disability of the holder by reasons of intoxication or the use of drugs; d, because of the gross negligence of the operator whereby person or property has been injured; e, for going away without stopping and giving his name and address after causing injury to any person or property. Before revoking such certificate of registration or license, the holder thereof shall be entitled to a hearing before the secretary of state or his deputy, upon 10 days' notice in writing; on the revocation of a certificate of registration or license to operate, neither the license nor the certificate shall be reissued unless upon investigation the secretary of state shall determine that the operator may again be legally permitted to operate. Upon the conviction of a person for an offense involving a third violation of section 287 (speed) of this article, within one calendar year, or of operating a motor vehicle while under the influence of intoxicating liquors or drugs, or for injuring a person or property by reasons of gross negligence in operating, or of going away without stopping or giving his name and address after causing injury to any person or property, the secretary of state may immediately revoke the license of the person so convicted and if any person convicted of any such offense shall appeal from the decision of such trial court, the secretary of state may suspend forthwith the license of the person so convicted and appealing and may order the license delivered to him and shall not reissue the same unless such person is acquitted upon such appeal, or unless the secretary of state shall decide that such license shall be reissued. Whenever any license or certificate shall have been revoked under the provisions of this article no new license or certificate shall be issued unless by the secretary of state to such person until after 30 days from the date of such revocation, nor thereafter, except in the discretion of the secretary of state. Notice of the revocation and suspension of any license or certificate of registration shall be transmitted forthwith by the secretary of state to the chief of police of the city or prosecuting officer in the locality in which the person whose license or certificate of registration so revoked or suspended, resides.

It would appear that those interested in the use of motor trucks were successful in defeating the measures introduced to limit the weight of vehicles used on the highways, since this subject is not covered in the new law as passed. And there is no change in the registration fees.

THE MAINE LEGISLATURE.

Creates Highway Commission, Adopts State Road System and Limits Truck Weight.

The Maine legislature has adjourned. The Maine Automobile Association is particularly pleased with the creation of a state highway commission and the adoption of a state road system, but it is not at all enthusiastic respecting the new law limiting the weight of motor trucks. The last named action appears to have been patterned somewhat after those which met with decided opposition in Massachusetts, New York, New Jersey and Pennsylvania. It provides that no vehicle of nine tons, including its own weight, shall be allowed on a highway without a special permit from the highway department or the municipal officers of the town. Motor trucks of between four and five tons are limited to 15 miles an hour, and those between six and nine tons are limited to six miles an hour. The size of tires also is regulated according to the weight of the vehicles.

The state highway commission will have jurisdiction over the expenditure of the $2,000,000 bond issue authorized by the voters last fall. None of this money can be used in the thickly settled portions of towns of 2500 population or more, and another provision is that it must be expended on through roads, in continuous sections of at least seven miles, provided there is that distance that can be constructed in the county before it reaches the county line or another piece of improved road. These state roads are to be built wholly at the expense of the state, the municipalities to pay the state $60 a mile annually for their maintenance. Another class of highways, designated state aid roads, is contemplated, in the construction of which the state is to render assistance in exactly the same proportion as the towns, the maintenance to be under the supervision of the state highway commission, the towns being required to pay $30 a mile annually for this purpose.

PROTEST TARIFF SCHEDULE.

Committee Representing Automobile Manufacturers Prepare Brief for Congress.

Protesting against the automobile schedule in the proposed Underwood tariff, by which the duty on chassis is reduced from 45 to 30 per cent. and that on parts from 45 to 20 per cent., while the duty on complete automobiles is retained at 45 per cent., a committee of automobile manufacturers representing 27 of the leading plants in the country is preparing to present its case to the ways and means committee of Congress.

The brief prepared purports to show that the reductions would throw much of the American automobile trade into the hands of the foreign manufacturers, as the only things they desire to import are chassis and parts, which can be assembled in this country at small cost. The manufacturers represented by the committee which makes the protest are as follows:

John S. Clark, vice president, Autocar Company, Ardmore, Penn.; C. Arthur Benjamin, general sales manager, American Locomotive Company, New York City; V. A. Longaker, general manager, American Motor Company, Indianapolis, Ind.; J. J. Cole, president, Cole Motor Car Company, Indianapolis, Ind.; G. W. Bennett, vice president, Garford Company, Elyria, O.; Elwood Haynes, president, Haynes Automobile Company, Kokomo, Ind.; Charles D. Hastings, secretary, Hupp Motor Car Company, Detroit; S. T. Davis, Jr., president, Locomotive Company of America, Bridgeport, Conn.; G. A. Kissel, president, Kissel Motor Car Company, Hartford, Wis.; H. M. Jewett, former president, Lozier Motor Car Company, Detroit; Leo A. Fief, general sales manager, Mitchell-Lewis Company, Racine, Wis.; George M. Dickson, secretary, National Motor Vehicle Company, Indianapolis, Ind.; George O. Daniels, vice president, Oakland Motor Car Company, Pontiac, Mich.; O. O. Hutchinson, vice president, Olds Motor Works, Lansing, Mich.; L. H. Kittredge, president, Peerless Motor Car Company, Cleveland, O.; George Pope, treasurer, Pope Manufacturing Company, Hartford, Conn.; H. M. Snyder, secretary, Reo Motor Car Company, Lansing, Mich.; H. B. Staver, Staver Carriage Company, Chicago; W. H. Whiteside, president, Stevens-Duryea Company, Chicopee Falls, Mass.; Frederick F. Fish, president, Studebaker Corporation, Detroit and South Bend, Ind.; Robert W. Allen, general manager, Warren Motor Car Company, Detroit; Windsor T. White, president, White Company, Cleveland, O.

TAXING MOTOR TRUCKS.

Special Registration Fees Already Required in Several of the States.

In view of the activity on the part of certain states, as represented by their legislators, in seeking to impose what is regarded as heavy restrictions upon the use of commercial motor vehicles, there is interest in learning what action already has been taken. In many commonwealths motor truck owners and users have been busy during the past few months protesting against bills that have been introduced. They were successful in Rhode Island and New York, and it remains to be seen what the outcome will be in Massachusetts, Pennsylvania and California. New Hampshire, New Jersey and Michigan enacted provisions which hardly can be conceded as representing progress in this respect.

A majority of the states make no specific mention of motor vehicles utilized for commercial purposes, the inference being that they are subject to the same fees as the so-called pleasure cars. An investigation of the laws now in force, or soon to go into effect, reveals the following special provisions for business motors:

Alabama, act of 1911—Motor vehicles used for public hire in transporting passengers or freight, $25.

Connecticut, act of 1912—Cars of 1000 pounds capacity, $5; above that, $2 for each 1000 pounds or fraction thereof.

Indiana, act of 1913—Flat rate of $5.

Maine, act of 1911—Flat rate of $10.

Maryland, act of 1912—Flat rate of $3.

Massachusetts, act of 1909—Flat rate of $5.

Michigan, act of 1913—Fifty cents a horsepower.

New Hampshire, act of 1913—One ton capacity, $10; one to two tons, $12.50; two to five tons, $15; over five tons, $20.

New Jersey, act of 1913—Over 4000 pounds capacity, $10 in addition to regular fees according to horsepower.

New York, act of 1913—Flat rate of $5.

Rhode Island, act of 1909—Flat rate of $2.

LEGISLATIVE BRIEFS.

It appears that Chief Edward Bromage of the police force in West Springfield, Mass., has revived the speed trap, with the result that during April 54 arrests were made in the Riverside section of that town, netting $340 in fines.

Mayor Gaynor of New York City has signed the new speed ordinance passed by the board of aldermen creating a speed limit of 20 miles an hour, but with a provision that in case of accident 15 miles an hour shall be deemed presumptive evidence of negligence. The ordinance goes into effect June 2.

The motor vehicle department in New York State has decided that no special license can be demanded for the use of a side car attachment on motorcycles. Until the matter was taken up recently by the Federation of American Motorcyclists it had been the plan of the department to class motorcycles with side cars as automobiles and to demand a fee accordingly.

Secretary of the Interior Lane has decided to permit automobiles in the Yosemite national park in California. This is looked upon as the entering wedge which will break up the transportation monopolies heretofore existing in the various national parks, and it is expected that cars will be admitted to other public lands of like character. The plan includes the imposition of an entrance fee, the fund to be expended in improving the roads.

The town of Eden, Me., in which Bar Harbor is located, has passed a new traffic ordinance, in which provision is made for automobiles. The speed limit is fixed at 10 miles an hour, and operators are cautioned to sound their warning signals in approaching curves. All vehicles, both motor driven and horse drawn, are required to carry lights from one hour after sunset to one hour before sunrise. It would appear that Bar Harbor was to receive motor tourists this year.

A Chicago jury, of which four members were automobile owners, recently found a defendant guilty of murder as the result of an automobile accident in which the victim was struck by the machine and rolled along the ground for some distance. The evidence tended to show that the chauffeur neglected to stop or make any attempt to see what injury had been inflicted. The court sentenced him to prison for 14 years. The case has served to indicate that automobile owners have little desire to condone reckless driving.

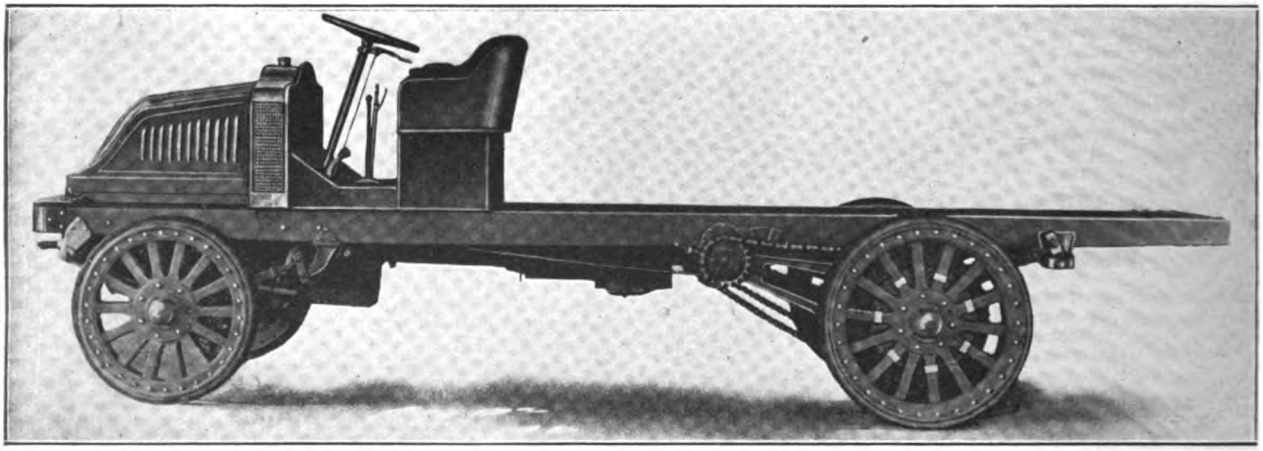
IN THE COMMERCIAL VEHICLE FIELD.

Constructional Details of the New Kelly Line, Now Equipped with Water-Cooled Motors---Two Interesting Additions to the Light Delivery Wagon List.

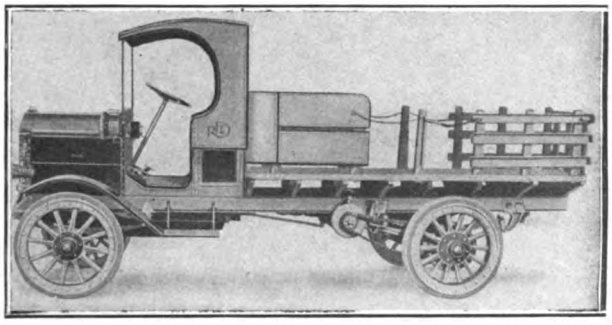


CONSIDERABLE interest attaches to the 1913 Kelly truck line, produced by the Kelly-Springfield Motor Truck Company, Springfield, O., largely because of the substitution of a water-cooled motor for the original blower system of cooling by air utilized in these machines when they were known as the Frayer-Miller. It also will be noted that the general design has been changed materially, this including a more elastic chassis frame, a radiator in front of the dash and behind the motor, and a so-called foreign type hood. The accompanying illustration is that of the three-ton model, and the company is producing a one-ton vehicle differing only in the type of motor and the jackshaft construction.

The larger motor is a four-cylinder, four-cycle, water-cooled T head type with the cylinders cast in pairs, the bore being 4.5 inches and the stroke 6.5, while the smaller is of the L head type with cylinders cast en bloc, the bore being 3.75 inches and stroke 5.25. The former is rated at 38.75 horsepower at 900 revolutions, to which maximum speed it is regulated by a governor, and the latter is rated at 30 horsepower. With both machines the motor is installed in the frame with a three point suspension, two at the forward end and the third at the rear.

The engine is lubricated by a dry base self-contained force feed system, the oil being stored in a reservoir in the base of the crankcase which has a capacity of 2.75 gallons. A centrifugal pump creating high pressure forces the lubricant through a system of tubing to all the bearings through a hollow crankshaft and to all the timing gears, the normal flowage being about 2.5 gallons a minute. The oil drains back to the reservoir and is filtered and used over and over. Cooling is by a circulation of water forced by a centrifugal pump driven by the cross shaft at the forward end of the motor through the water jackets, and the tubular radiator is incorporated with the dash. Ignition is by an Eisemann high-tension magneto fitted with a governor that automatically advances and retards the spark. The fuel also is controlled by a governor of the vertical loose ball type.

The cone clutch is coupled to the driving shaft by a double universal joint, and the main driving shaft is enclosed in a torque tube that is supported at its forward end in the centre cross frame member by a double swivel joint. The transmission gearset, incorporated with the jackshaft, is of the selective sliding gear type with three forward speeds and reverse. With the smaller vehicle the jackshaft is of the semi-floating type, and by removing either the top or the bottom of the jackshaft housing the differential gear may be taken out.



Springs are semi-elliptic. Two sets of brakes are fitted, these being internal expanding on rear wheel drums. Wheels are of the conventional artillery type, the larger machine being shod with 38 by five-inch single solid tires in front and 42 by five-inch dual tires at the rear. The smaller has

Side View of Three-Ton Kelly Truck Chassis, Utilizing Water-Cooled Engine, Foreign Type Hood and Radiator Behind the Motor.

Digitized by Google

36 by 3.5-inch solid tires in front and 36 by four-inch in the rear, with an option of 38 by 5.5-inch pneumatics at slight additional cost. The stand-

Reo Delivery Wagon of 3000-4000 Pounds Capacity.

ard wheelbase of the three-ton machine is 150 inches, although options of 130 and 172 are permitted. The standard loading space is 12 feet three inches, and the options, nine, 15 and 17 feet. The standard wheelbase of the one-ton is 120 inches, with loading space of nine feet, which may be increased to 12 feet upon option. The driver is located at the left with levers in the centre.

REO DELIVERY WAGON.

Use of Sectional Radiator Insures Against Failure of the Cooling System.

The new Reo delivery wagon of 3000-4000 pounds capacity, made by the Reo Motor Car Company, Lansing, Mich., has a number of interesting features, among which may be mentioned the sectional radiator, this being of the tubular design, constructed in 24 sections, so arranged that one or more may be removed and the machine used wih efficient radiation. The motor is a four-cylinder, water-cooled unit, with valves in the side and head, and the cylinders are cast in pairs. The crankcase is a single casting of aluminum, carrying three main bearings that are adjustable from the outside. The crankshaft is large and of manganese steel.

The motor is cooled by a circulation of water by a gear driven pump, aided by a belt driven fan and a fan spoked flywheel. The lubrication is a combination splash and force feed, the bearings being flooded by a plunger pump, and splash supplying the other moving parts. The excess from the constant level of oil is drained to the reservoir, filtered and used over again. The carburetor is an automatic float feed type with hot air intake, adjustable from the dash. Ignition is by a low-tension magneto and auxiliary battery.

The clutch is a dry multiple disc design, the discs being faced with anti-friction material, contained in a dust tight housing. The transmission is of the selective type, giving three forward speeds and reverse. The drive is through a shaft having two universal joints and side chains. The differential is of the four-pinion construction.

Springs are semi-elliptic. The brakes are external contracting with bands two inches wide, acting on 12-inch drums on the jackshaft and 17-inch drums on the rear wheels. The frame is a steel channel section. The front axle is a round steel section and the rear axle a hammered forging, both being fitted with Timken bearings. The wheels are 36 inches diameter with four-inch single tires forward and three-inch dual tires rear. The wheelbase is 130 inches. The driver is located at the left and the control levers in the centre.

BROWN USES INTERNAL GEAR.

Constructional Details of Light Delivery Wagon Produced in Peru, Ind.

Beginning the production of a 1500-pound delivery wagon late last year, the product of the Brown Commercial Car Company, Peru, Ind., may be regarded as among the newer additions to the industry. It is designed for fast, light delivery, and its principal feature is the use of the internal or concentric gear drive.

The motor is a vertical, four-cylinder, four-cycle, water-cooled L head unit with cylinders cast en bloc. The bore is 3.75 inches and the

Brown Commercial Car for Fast, Light Delivery.

stroke 5.25, giving a rating under the S. A. E. formula of 22.5 horsepower. Lubricant is circulated by two plunger pumps driven by eccentrics

Digitized by Google

on the camshaft, through a system of tubing to the main bearings and timing gears, and drains into the crankcase, where a constant level is maintained for splash lubrication of camshaft bearings, cams, valve tappets, connecting rods, pistons and cylinders. Water is forced through a vertical radiator by a centrifugal pump, and cooling is further aided by a fan driven by a flat belt. The radiator is suspended on coiled springs and is insured against stresses of any kind due to chassis distortion. The carburetor is of the automatic float feed type, and ignition is by a Remy magneto.

The clutch is a dry plate design with 27 plates, 14 of which are faced on either side with an anti-friction material. The transmission is selective, giving three forward speeds and reverse. Drive is through a 1.75-inch tubular shaft fitted at either end with dust proof universal joints, and the torque and driving strains are taken by two large tubes extending from the brake spiders to a cross member in the centre of the chassis frame. The forward ends of the tubes are mounted with a globe that is carried in a bracket on the cross frame member. The shaft extends through an opening in the heavy drop forged rear axle web to a countershaft bolted at the rear of the axle, and a pinion meshes with the bevel gear of the differential. Pinions at the outer ends of the shafts mesh with the internal gears bolted to the rear wheels.

Springs are semi-elliptic. Two sets of brakes are fitted, internal expanding and external contracting. The wheelbase is 122 inches. The wheels are of the artillery type, fitted either with 34 by 4.5-inch pneumatic tires on demountable rims, or Motz cushion tires, 34 by 3.5 inches forward and 34 by four inches rear.

WELL PLEASED WITH KNOX.

California Owner Reports Splendid Record for Machine During Past 2.5 Years.

C. W. Ayers, mining engineer of Jamestown, Cal., has driven his four-cylinder Knox car, made by the Knox Automobile Company, Springfield, Mass., over the most unfrequented roads of the Sierra Nevada mountains and across the hot, sandy desert and oil fields of the South, during the last 2.5 years, covering over 20,000 miles. During that time he states that the machine has never been taken down or overhauled.

He gives a further brief history of his car as follows: Had valves reground twice; engine compression apparently as good today as on the first day's run; has the same spark plugs, valves and springs furnished with the car; carburetor, magneto and sparking system never disturbed; oiling system as perfect as when put in; can speed up to 60 miles an hour and take all grades on the Altamont hills on high gear.

PANAMA-PACIFIC EXPOSITION.

Director Feels Proposition Was Not Placed Before Industry in Proper Light.

Robert Alexander Crothers of San Francisco, Cal., editor of the San Francisco Bulletin and director of the Panama-Pacific Exposition, is disappointed because plans for a great automobile building at the exposition did not meet with the approval of the industry, and recently interviewed several prominent motor car manufacturers on the subject. He believes that there was a wrong impression relative to the project and says:

> I find that at other expositions selling of automobiles has not been allowed, and that the manufacturers have not been allowed to change their exhibits during the exposition. We intended to make this great exhibition hall a place for business. I am going to try to bring about the exhibition just the same, believing that under the plan we had in mind, and which apparently was not placed before the makers in the right light, the show will be a pronounced success.

WANTS LICENSE NO. 1.

Haynes Automobile Company Makes This Request of Secretary of State.

The Haynes Automobile Company, Kokomo, Ind., maker of Haynes cars, has made a request of L. G. Ellingham, secretary of state of Indiana, for license No. 1 under the new Indiana motor vehicle registration law, which goes into effect July 1. The request is based upon the claim that the first automobile in the United States, which was a Haynes, made by Elwood Haynes, who was born at Portland, Ind., is due this recognition in the State of Indiana.

The secretary of state's attention is called to the fact that the "Pioneer," the machine which inaugurated the American gasoline automobile industry, and brought fame to Indiana, is now in the custody of the Smithsonian Institute at Washington, D. C.

The Merchants' Association of New York City has removed from 54-60 Lafayette street to new headquarters in the Woolworth building, 233 Broadway, where much needed room will be at the disposal of the various bureaus.

Digitized by Google

AVAILABLE LIQUID MOTOR FUELS.

THE automobile owner naturally is deeply interested in the subject of fuel. The increased cost of gasoline has brought the matter directly to his attention, and has served in no slight measure to urge greater activity among engineers in an effort to secure a satisfactory substitute. Devices for carbureting kerosene and mixtures of kerosene and gasoline are making their appearance both in this country and abroad. The problem has assumed definite form and the effort to find the proper solution may be described as universal.

As is more or less well known the American Society of Automobile Engineers has undertaken a systematic investigation of the subject, and without doubt much important work will be done by this body during the coming year. The experiments hardly will be limited to the engineers connected with the production of cars and carburetors. The owner has played an important part in the development of the industry, and it may be expected with reason that some very valuable suggestions will be received from that source in the present instance, particularly during the summer, when the matter of vaporization is unattended by the difficulties met in colder months. With this fact in mind, it is of interest to consider from time to time some of the discussions presented by members of the S. A. E. at the meetings of its various sections.

In a paper read by N. B. Pope before the Metropolitan section early in the year, the importance of this subject was brought out very forcibly. After citing the increased demand for hydrocarbon fuels, Mr. Pope said:

In this connection two circumstances stand out conspicuously. The first is that the lust of the automobile industry for producing low and medium priced cars in huge quantities continues unsatiated; and the second, that the output of commercial vehicles has begun to assume proportions of magnitude. Despite the rate of obsolescence that is comparatively high (though tending to decrease as the art becomes more familiar), and the upbuilding of substantial foreign markets, the curve of annual automobile consumption in the United States continues to sweep upward. Nor is it even remotely possible to foretell when the maximum will be reached and when, in consequence, the automobile industry itself may become truly stabilized. Automobile fuel consumption, while in large measure responsive to conditions affecting the general welfare, must, naturally, be forced upward by net production; that is, production which is not offset either by obsolescence or exportation. So long as the number of automobiles in use increases, just so long the fuel demand of the country must increase; and to foresee the limit to the growth of the one is no easier than to foresee a limit to the growth of the other. Decreased production, due to whatever cause, would, however, not mean decreased fuel consumption, save as both might be subject to the same external influences. In other words, while there is no way of foretelling just when the fuel market will cease its present rapid expansion, it is practically certain that little short of a total cessation of business activity throughout the country—a serious panic—could materially affect it, and then only temporarily.

Mr. Pope quoted estimates from official sources which tended to show a rate of increase in automobile fuel consumption of more than 40 per cent. a year, while the world's production of petroleum, as based on government statistics, showed an increase of only five per cent. from 1910 to 1911. And he further stated that this gain was due wholly to increased production in what formerly was termed "fuel oils," or the asphaltic oils of the gulf, mid-continent and California fields, which was increased by about 12.7 per cent., so that the so-called "refinery oils" actually decreased by a trifle under 2.5 per cent.

The paper made a plea for a standardized fuel and added: "Despite the immensity of the demand the automobile fuel market is without an acknowledged competitor for gasoline. * * * Had the automobile industry, or a substantial portion of it, set out to design motors to use kerosene, distillate or any other fuel than gasoline a couple of years ago, the present situation might have been averted."

A more recent discussion is that presented by A. E. Potter, in a paper read before the Indiana section of the society, entitled, "Liquid Motor Fuels." This took up in detail some of the fuels available for automobile use and was in part as follows:

Of the liquid fuels proposed for use in automobile motors but two, wood and grain alcohol, belong to the carbohydrates, while the hydrocarbons, with which we are more familiar, include besides naphtha and kerosene, the two best known, benzene, benzol, distillates, compressed natural gas, gasoline, etc.

Alcohol.

Wood alcohol cannot be considered as a possible fuel for internal combustion motors, for the reason that formic acid, resulting from the action of heat, has an extremely deleterious effect upon the metal of the cylinders, pistons and rings. Its high cost of production also renders it unavailable.

Grain alcohol possesses many disadvantages, such as its necessarily high cost of manufacture, low fuel value, necessity of an abnormally high compression to secure efficiency and difficulty in the matter of efficient lubrication.

Several years ago I made some exhaustive investigations as to the possibility of using grain alcohol as a fuel for marine internal combustion motors, and as a result made some seemingly radical statements, declaring it unsuitable for such use. At the time President Roosevelt's commission, headed by Professor Lucke, were engaged in the investigation of the alcohol question abroad. Motor boat and yacht clubs were laboring to influence federal legislation to secure free alcohol for use for industrial purposes, and farmers were contemplating the installation of stills for utilizing the waste from their crops. I was taken severely in hand, my published conclusions being in the nature of cold water doused upon a very hot get-rich-quick scheme. A few months later the report of the free alcohol commission convinced my critics, against their will, bearing me out completely in my conclusions. It was later found that instead of laboring for free alcohol for use in marine motors, they wished

Digitized by Google

the remission of the internal revenue tax for entirely different industrial purposes.

I am just as confident today as I was seven years ago that grain alcohol will never be used to any appreciable extent for the propulsion of motor cars or motor boats, and I do not hesitate to predict that motor car owners would rather pay 50 cents a gallon for naphtha than 25 cents a gallon for grain alcohol, and that they would be able to secure greater mileage a unit of cost with the higher priced fuel. I think we should not consider any carbohydrate for motor fuel.

Hydrocarbons.

Of the hydrocarbons, benzol derived from the distillation of coal, shale oil from oily shales found in various localities, compressed natural gas and gasoline, should on account of their very much higher cost of production, be eliminated. This leaves us as available motor naphtha, benzene, kerosene and crude distillates.

It is only within a few years that refiners have ceased the production of gasoline lighter than 86 degrees Baume. The 88 and 90 gasoline formerly offered now all goes into the 86 grade to increase its gravity and add to the volume of the higher-priced product. Considerable of the so-called naphtha fraction lighter than 76 and heavier than 86 degrees, which formerly was recovered as 76 naphtha, is now marketed with the so-called 86 gasoline used largely for the purpose of illumination and the recovery of oils.

The term gasoline, it may be noted, is here used to designate the volatile distillate of 86 degrees and lighter, while naphtha was formerly the term used for distillates known as 74 and 75 degrees naphtha, and benzene was offered in gravities between 58 and 66 degrees. Kerosene is the next heavier of the light distillates. It may be news to many that there are several grades of kerosene, of different standards of fire test and color. Today the principal commercial grades in the order of their gravity, the lighter being mentioned first, are 110-fire test, standard white; 130-fire test, standard white; 150-fire test, water white, and 300-fire test.

That which was called 76 naphtha a few years ago was any grade that would show a gravity of at least 74 degrees, while the so-called 74 had to show at least 72 degrees. Today practically all the true naphtha on the market is called 74 degrees, and is approximately of that gravity. This grade is very largely exported to Great Britain, France, Italy, Germany, etc., where it is sold in competition with other imported motor spirit, petrol or essence. There is practically no 74-degree naphtha used in this country for automobile motors.

Many of us remember that a few years ago vapor and "gasoline" stoves were advertised and largely used, after certain big interests had influenced the various boards of fire underwriters to permit their use in insured buildings. These devices were designed to utilize the vast accumulations of naphtha too heavy to be utilized for 74 and 76-degree naphtha together with unmarketed benzene, and the term "stove gasoline" was given to this product. Gas engines designed for use with coal gas had become adapted to use of naphtha and air, and it quite naturally became customary to use the term gasoline engine, rather than naphtha engine, and call naphtha gasoline. Another circumstance that no doubt was a factor in misnaming the internal combustion engine using naphtha was the fact that the Gas Engine & Power Company were putting out what they called naphtha launches, practically steam engines, except that naphtha was used in the flash boilers instead of water.

Stove gasoline was the progenitor of automobile naphtha, as it is called by the trade, and gasoline by motor users. To this stove gasoline has been added practically all the benzenes and some of the kerosene, and today it is not unusual to find motor fuel of this sort offered with a gravity of but 58 degrees, and the exception to find it 62 degrees, and the end is not yet, for following the law of supply and demand motor naphtha must either grow heavier and heavier or the price will have to be advanced to check the demand.

I have before me some distillation tests of Texas motor naphtha, made during the past year, which in this connection are of interest. These samples in the order of their dates of receipt are called Nos. 1, 2, 3, 4, 5 and 6. Their gravities were respectively 59.4, 57.7, 57.2, 61.3 and 61.4 Baume. The boiling points were 142, 157, 183, 195, 134 and 130 degrees Fahrenheit, while 50 per cent. distilled at 222.5, 229.5, 235.5, 228 and 226 degrees, and it took maximum temperature of 323, 324, 314, 310, 330 and 329 degrees to distill the entire samples. It may be interesting to note that the entire ranges of temperature between boiling points and total distillation were respectively 181, 167, 131, 115, 196 and 199 degrees Fahrenheit, the No. 4 sample Texas disclosing a remarkably short range, while samples Nos. 5 and 6 showed an unusually long range, nearly 200 degrees.

A sample of Standard Oil 74 degrees naphtha on distillation test showed a boiling point of 100 degrees, 50 per cent. passed over at 162 degrees, while it took 275 to distill the entire sample. Its gravity at 60 degrees Fahrenheit was 73.3 Baume.

On the redistillation of the naphtha fraction subsequent to its usual treatment with sulphuric acid and water in an agitator, the product being later neutralized with lime or some other alkali, there will be formed a certain percentage of kerosene. The kerosene fraction will likewise furnish a percentage of the naphtha series. In the refining of naphtha this kerosene will be left in, while in refining kerosene all the naphtha has to be refined in order to have the product possess the required fire test. The very last of the product takes a relatively higher temperature to distill, while from the boiling point to the 10 per cent. distillation point a variety of ranges results, the wider the range the greater being the percentage of more volatile naphtha.

Occasionally one will find a naphtha that on distillation will show a very slow rise in temperature during the first 10 to 20 per cent.; thence rising uniformly more rapidly. In such an instance it would be proven conclusively that the naphtha was not a natural but a mixed product, a heavy grade of naphtha or even benzene fortified with high test volatile naphtha, gasoline or even compressed natural gas to secure the desired gravity. In fact, some refiners even advertise high test gasoline for mixing purposes. The line of demarkation between motor naphtha and kerosene is one largely of convenience and conditions. If the price of kerosene were higher than that of naphtha it is safe to say that no kerosene would be allowed in the motor naphtha, but as there is a growing surplus of kerosene and a scarcity of naphtha the natural tendency is to include just as much of the lighter kerosene in the motor naphtha as the trade will stand.

Kerosene.

It should be remembered that gasoline, naphtha and benzene have no fire test. In other words, a flame will ignite either one of them at any temperature. On the other hand, kerosene has a fire test; in other words, kerosene will not ignite until its temperature is raised to a certain degree, known as its fire test. The lowest fire test kerosene produced is known as 110-degree standard white. This grade cannot be used in this country for illuminating purposes, but is considered sufficiently safe for use in some foreign countries, to which it is exported, not so heavily, however, for the last year or so since much of this grade has been included in motor naphtha. The grade known as 130-degree standard white is being marketed from tank wagons to storekeepers in New York at about 8.25 cents a gallon, while the 150-degree water white brings nine cents. Jobbing prices for 150-degree water white in bulk, cargo lots, are about 5.8 cents a gallon, with quotation on 110-degree at 4.8 cents.

The boiling point of kerosene is from about 300 to 400 degrees. There is no question but that the 110-degree grade is very much more volatile than the 130 and that the 150 is not nearly so volatile as the 130.

The next heavier petroleum product, after kerosene, is a mineral oil used largely in the oiling of wool, for the purpose of adulteration, and in paints, etc. It, like kerosene, has practically no lubricating quality, and has a fire test of approximately 325 to 350 degrees Fahrenheit. From this it may be seen that 150 kerosene may contain all the heavier kerosenes up to this product, although some refiners put out a grade of 300 kerosene for use in miners' lamps or for signal purposes. Even at that the 150 kerosene, or even the 130—if it is not up to standard of color—may contain kerosene of 295 fire test. This would give a range of temperatures from a boiling point of about 300 to a maximum temperature of about 400, before the very heaviest kerosene would all distill, providing all the 300 kerosene is removed from the product.

When one comes to compare the distilling temperature of 74 Baume naphtha, motor naphtha and 150 fire test kerosene, one begins to realize something of the problem that has so far not only baffled the successful use of ordinary illuminating kerosene in motor car motors, but in adopting mixed naphtha and kerosene as an automobile motor fuel, the light products vaporizing very readily, while the heavy portion at best is liable to enter the cylinder in far from gaseous form.

Digitized by Google

G. C. VAPORIZER UTILIZES HEAVY FUELS.

Presents Novel Features in That It Replaces Usual Muffler—Heat of the Exhaust Gases Is Employed to Vaporize Kerosene, Etc.

COINCIDENT with the exploitation of kerosene as a substitute for gasoline is the announcement of the formation of the G. C. Vaporizer Company of America, Inc., 1790 Broadway, New York City, which concern will manufacture and market the G. C. vaporizer. The latter is not a new product, as it has been in service in England for nearly two years, and is now being utilized with success on commercial vehicles, motor boats and stationary engines. Its use is not confined to mechanical transports, it having been tested out on pleasure automobiles and one of the trials included a 700-mile trip with a four-cylinder Adlake car. At the end of the test the motor was examined and found to be free from carbon or soot, usually deposited with gasoline as a fuel.

The G. C. vaporizer is a radical departure from the ordinary type of carburetor in that vaporization of the kerosene or heavy fuels is obtained through the utilization of the heat of the exhaust gases in a novel manner, rather than by atomizing the fuel mechanically as it issues from a jet. Although a certain amount of outside air is employed, this is so regulated by the construction of the mixing valve and other components of the system, that it is maintained that varying atmospheric conditions do not affect the mixture.

The company does not claim that a cold engine may be started on kerosene with its vaporizer, but does state that the latter will retain its heat for a considerable period and that it is possible to restart the engine after being inoperative for approximately two hours. The installation of the G. C. vaporizer does not in any way interfere with the design or construction of the motor, which retains the usual gasoline carburetor, this being employed for starting purposes and its use being continued until sufficient heat is obtained. It is held that the desired temperature is secured in a short time. As the heavy fuel mixture is conveyed to the intake manifold and above the carburetor the use of either the regular or heavier fuel is possible, the one independently of the other.

Diagrams of the G. C. are shown at Fig. 1 with the components lettered, while the general arrangement is illustrated at Fig. 2. It will be noted that the vaporizer replaces the conventional muffler and that the exhaust gases are led by the usual piping from the exhaust manifold of the motor. Thus the vaporizer is a muffler and serves a useful feature in that the heat usually wasted is utilized for distilling the fuel.

The exhaust gases pass through the central tube of the vaporizer and follow the path indicated by the arrows to the exhaust outlet. During the passage of the hot gases they heat up a triple layer of small fragments of cast iron through which extends a horizontal pipe containing the fuel. The tube has a large number of perforations about .145 inch in diameter and the liquid is distributed by gravity onto the heat accumulating bodies, resulting in its being instantly

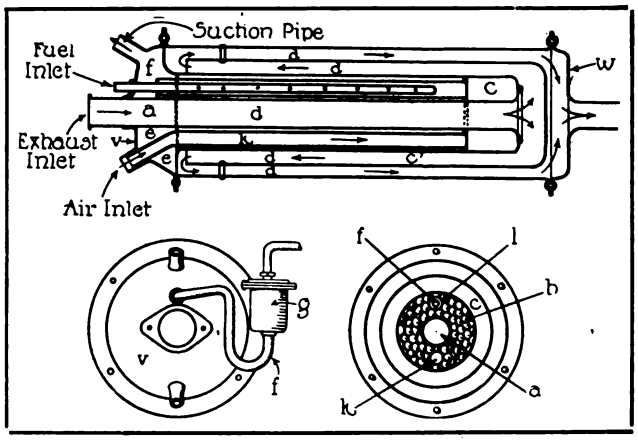


Fig. 1—Sectional Diagrams of G. C. Vaporizer, a Combined Muffler and Vaporizer Having Novel Features: a and c, Heat Retaining Jackets; b, Heat Absorbing Metal Blocks; d, Exhaust Expanding Room; e, Gas Space; f, Perforated Fuel Tube; g, Fuel Pipe; k, Air Pipe; l, Kerosene Pipe Protector; v, Front Cover; w, Back Cover.

vaporized. At the same time atmospheric air is drawn through the lower opening and mixing with the vapor, a very homogeneous mixture is obtained. This is supplied to the cylinders, compressed and burnt in the usual manner.

The amount of kerosene entering the perforated pipe of the vaporizer is automatically regulated by the suction of the motor and the supply is augmented in proportion to its speed because the vacuum produced is in proportion to the throttle opening. When the engine is operating at high speed the metal fragments in the vaporizing chamber absorb the excess heat, holding it in reserve until the speed of the motor

Digitized by Google

falls, or for starting purposes. It is held to be possible to vary the speed of the motor from its minimum to its maximum with the same degree of flexibility as with the gasoline carburetor.

Regulation of the fuel is by a float chamber supplying a small stand pipe having a normal level slightly below the top of the pipe. The volume of heavy fuel mixture passing to the cylinders is controlled by a throttle incorporated with the air mixing valve shown at Fig. 2, and the control of the bi-fuel system may be simplified by the steering wheel control of the gasoline carburetor and that of the heavy fuel by the accelerator.

The adjustments are simple and once the vaporizer is installed it is stated that it requires no other attention than filtering the fuel. If the motor shows signs of smoking on a full charge

The consumption of lubricating oil is stated also to be reduced as much as 20 per cent., because the explosive mixture is saturated with lubricant, and automatically lubricates the cylinder walls. One motor, after 4000 miles of operation with the G. C. vaporizer, was disassembled and no deposits of carbon or soot were found. Another advantage held in the use of kerosene is its relative non-inflammability compared with gasoline. It is pointed out that there is an improvement in the operation of the motor with light loads and that the cylinders are cooler as well as acceleration is much quicker. Although the exhaust gases are utilized for vaporizing the fuel there is no more back pressure in the vaporizer than with any well designed conventional muffler.

It is understood that the G. C. vaporizer is to be tested at the laboratory of the Automobile

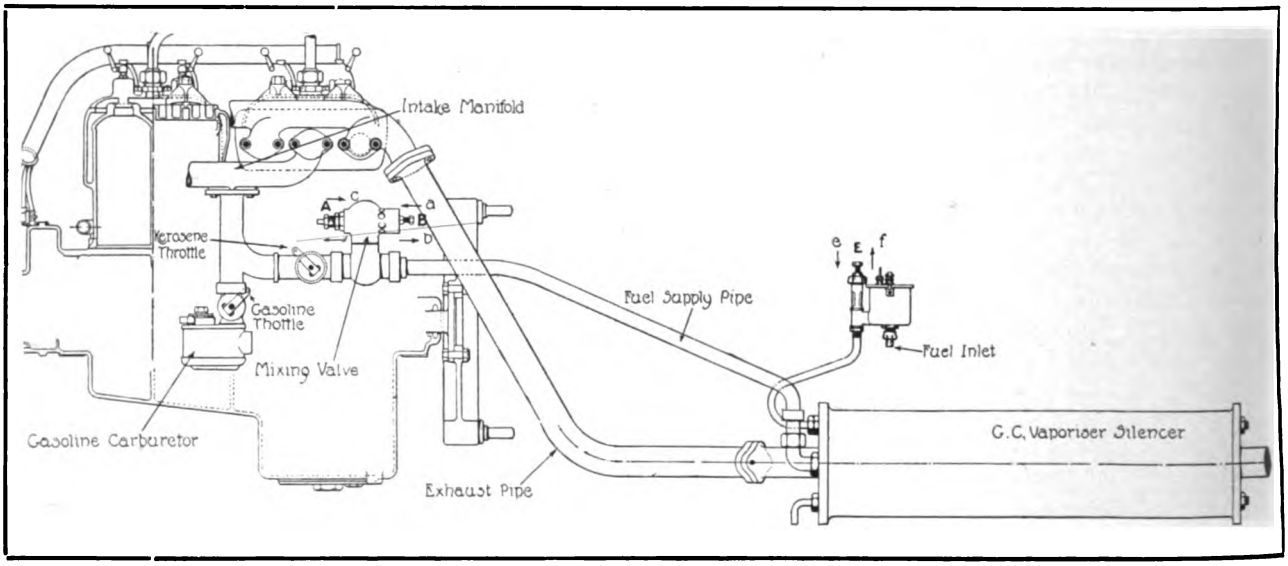

Fig. 2—General Arrangement of G. C. Vaporizer Showing Air Mixing Valve, Fuel Supply Pipe and Device for Regulating Flow of Kerosene.

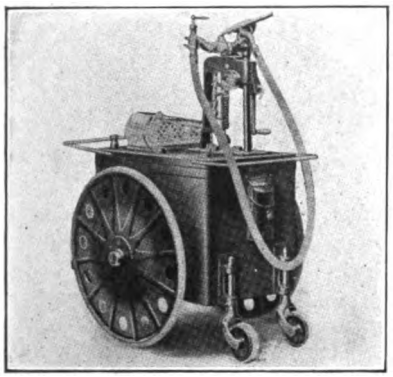
the screw A of the air mixing valve is moved in the direction of d. If it backfires the screw is rotated in the direction of c. Adjustment for low speed is secured by the screw B, this being moved in the direction of a for smoking and towards b for backfiring. Further adjustment is provided by moving the screw E of the float member in the directions e and f, for smoking and backfiring respectively.

The use of fuel other than kerosene is possible, as alcohol, low grade kerosene, heavy petroleum and even ordinary methylated spirit has been successfully employed. It is claimed that the consumption of kerosene is about 20 per cent. less than that of gasoline and this economy is attributed to the utilization of the waste heat of the exhaust gases.



Club of America. According to a representative of the company a two-day truck economy test is being contemplated. Two five-ton trucks are to be utilized, one employing gasoline and the other kerosene and a G. C. vaporizer.

The Manhattan Automobile Club, the new organization of owners and sellers of motor cars, has formally opened its quarters in the Gainsborough studios on Fifty-ninth street, New York City. The club has been organized with the intention of doing rather more for the motorists than the ordinary automobile associations, both on the social side and also from the point of view of legislation that deserves to be encouraged or opposed. A. B. Cordner is president of the club and the directors are well known in the industry.

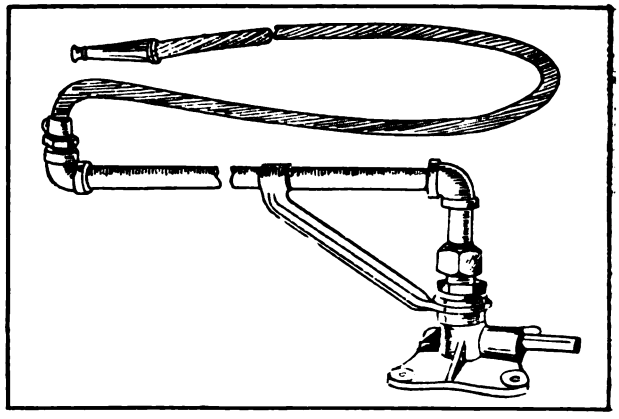
GARAGE AND REPAIR SHOP EQUIPMENT.

THE profit attendant upon handling gasoline depends largely upon the equipment. Not only should the system prevent waste, but also the loss of time. As the majority of garages supply fuel to transient trade it is not always convenient to have the machine driven into the building. The American Oil Pump & Tank Company, Dayton, O., is marketing the American wheel tank, which is designed to be moved about the garage and to the sidewalk, and it includes those features making for convenience and economy.

American Wheel Tank.

The tank proper has a capacity of 50 gallons and is constructed of .1875 inch metal, being seamless and welded with internal reinforcements. The handles and brackets which support the small wheels are welded to the body of the tank. The latter is carried in a steel basket frame having heavy uprights of cast steel and to which are secured the spindles for the large pressed steel wheels. The steel frame passes underneath the tank, supporting it and eliminating strains. The large wheels rotate on ball bearings and are shod with Goodyear 1.25-inch solid tires. The small wheels are also rubber tired.

The tank is equipped with a wheel brake, magnetic contents indicator, properly screened filler pipe fitted with a brass cap, an automatic gas and air vents. When specified the equipment also includes a triplicate autographic register and charge slip box, as shown in the accompanying illustration.



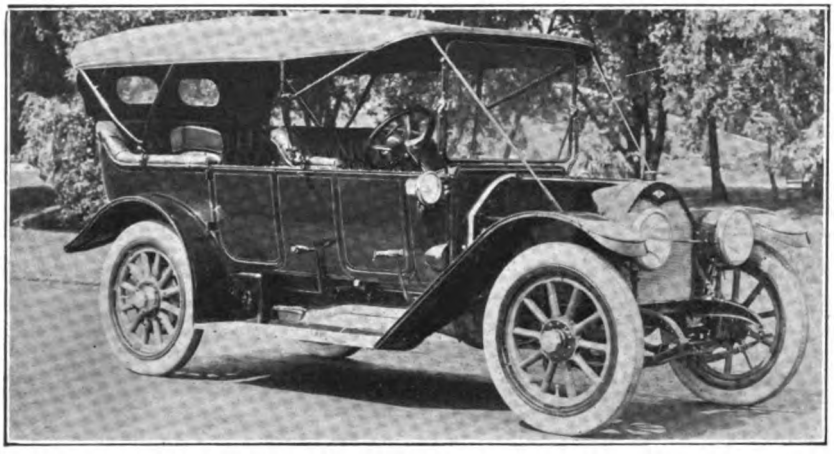
The pump is a continuous flow member, equipped with a recording gallon meter, gasoline filter, two-way discharge, discharge register and spring lock. It is adjusted to measure a pint, quart, half-gallon and gallon, and it discharges on both the up and down stroke of the piston. Four and one-quarter turns of the crank discharge a gallon and leave the pump ready for the next operation. It is operated in the same manner as a single acting pump and it is claimed that 50 per cent. time, labor and wear is saved. All measurement stops are sealed into position and all valves are accessible. Complete data and price list will be forwarded upon request by the maker.

WALWORTH WASHER.

The Walworth Manufacturing Company, Boston, is manufacturing the Walworth auto and carriage washer which is of the swivelling type and moderately priced. It is secured to the ceiling by lag screws, and the arm swivels horizontally in a complete circle, eight feet, eight inches in diameter. The working parts are of brass, with other components of cast and wrought iron, heavily galvanized.

The washer not only enables the operator to reach easily any part of the machine being washed, but the hose is kept off the floor, adding to its life. The complete equipment comprises in addition to the washer and lag screws, 15 feet of .75-inch three-ply hose with couplings, and a Boston spray nozzle. The maker has an interesting proposition for dealers, particulars of which will be forwarded upon application.

Illustrating the world wide extent of automobiling and the increasing co-operation among the various organizations, reciprocal relations are being established between the Nippon Automobile Club of Japan and the American Automobile Association, as a result of the action at the recent meeting of the executive board of the latter association. The Japanese association particularly urges Americans to visit unexplored Japan, and the Nippon club will supply all necessary routes and information as to the best roads.



Walworth Swivelling Type Auto Washer, Designed for Attachment to the Ceiling.

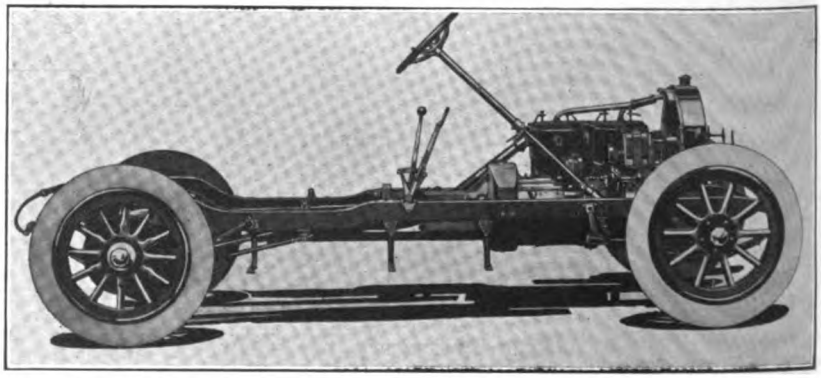
ABBOTT-DETROIT MADE IN SEVEN MODELS.

FOUR models known as the 44-50 and three as the 34-40, comprise the Abbott-Detroit line produced by the Abbott Motor Company, Detroit. The two chassis are defined by the horsepower developed in brake tests, and the mechanical construction is similar with the exception of the horsepower, wheelbase and size of tires. The 44-50 models include three open and one enclosed body, a seven-passenger touring, demi-tonneau, battleship roadster and a cab-side limousine. The 34-40 chassis carries a five-passenger touring, three-passenger roadster and a three-passenger Colonial coupe. All open bodies are of the fore door type, having attractive lines, luxurious upholstery and high grade finish. The equipment is very complete, including electric lighting and electric motor starting, these being separate units.



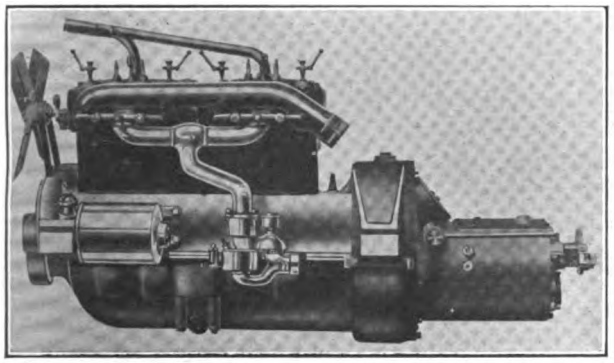
Abbott-Detroit 44-50 Seven-Passenger Touring Car, the Equipment of Which Includes Electric Lighting and Electric Motor Starting Systems.

The motor of the 44-50 models is a Continental of the L head type with the cylinders cast in pairs and having a bore of 4.5 inches and stroke of five. Although rated at 32.4 horsepower by the S. A. E. formula, the four cylinders develop from 45 to 53. The power plant of the 34-40 models is a Continental with a bore of 4.125 inches and stroke of 5.25. The crankshaft and camshaft are a high grade carbon steel, and the bearings of the former are three in number. The valves are 2.25 inches in diameter with nickel steel heads and machined steel stems. The pistons, exhaust manifold and cylinders are gray cast iron and the divided crankcase is a high grade aluminum alloy.

Carburetion is by a double jet Mayer with dash adjustment, and with all models the fuel supply is liberal. Each tank is provided with a reserve capacity, varying according to the model, and each is fitted with a self-measuring gauge. Ignition is by the Splitdorf dual system with the magneto located on the right of the power plant and driven through an extension of the pump shaft. Lubrication is by a constant level splash system, a double plunger pump driven off the camshaft maintaining the proper level at all times. Cooling is by a gear driven centrifugal pump, aided by a belt driven fan. The radiator is of the cellular type.

The clutch is a 17-plate multiple dry disc type, each alternate steel disc being faced with Raybestos. A three-speed selective transmission, having chrome nickel steel gears and nickel steel shafts, is a part of the unit power plant, and Timken roller bearings are employed throughout. The drive is through two Spicer universal joints and a nickel steel shaft to a full floating type of rear axle having chrome nickel steel gears and shafts.

Timken roller bearings are used in the axle and Shafer annular bearings in the wheels. The torque arm is a two-piece tubular member and radius rods take the drive from rear axle, per-



Chassis of the 44-50 Abbott-Detroit, Noticeable for Its Low Centre of Gravity, Compactness and Accessibility of Components.

Digitized by Google

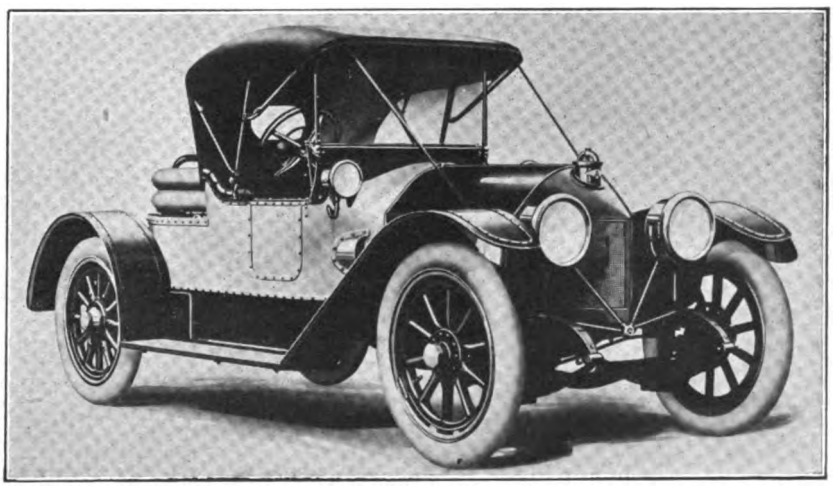
mitting rear springs to be shackled at both ends.

The brake drums are liberal in size, 16 inches, and are fitted with external contracting and internal expanding brakes, both of which have equalizers and a simple method of adjustment. Raybestos is utilized as a lining and the drums and hubs are of pressed steel with drop forged steel driving flanges. The emergency brake lever is a drop forging and drop forgings are employed throughout the brake assembly.

Unit Power Plant of Abbott-Detroit 44-50 Model, Showing Location of Electric Motor Starter.

Both the front and rear springs are of the underslung type, lowering the centre of gravity without decreasing the road clearance. The front members are semi-elliptic, 38 inches long and two wide, while the rear are three-quarter elliptic, 48 inches long and two wide. The leaves are carefully oil tempered, ground and polished, and all eyes are bushed. All parts of the chassis subject to friction are lubricated by grease cups. The frame is of pressed steel, of ample dimensions, and is provided with a double drop under the tonneau doors.

The wheels are of the heavy artillery type, of carefully selected hickory, and are fitted with Booth demountable rims and Goodyear No-Rim-Cut tires. Thirty-six by 4.5-inch shoes are standard on all 44-50 models with the exception of the roadster, which is shod with 35 by 4.5-inch casings. The 34-40 chassis is fitted with 34 by four-inch tires. Oversize shoes are listed as extra.



The front axle is a one-piece drop forging of the I beam section type and Timken roller bearings are employed. The tread is standard, 56 inches, for both chassis. The wheelbase of the larger chassis is 121 inches, that of the 34-40, 116.

The steering gear is of the irreversible worm gear type and the column is set at a comfortable angle, being surmounted by an 18-inch ebonized wheel of special design. The spark and throttle control is mounted on the wheel and the levers throughout are drop forged, .25-inch cold rolled rods being utilized.

The fenders, dust shields and running boards are of pressed steel, the boards being covered with linoleum having nickel plated binding on the edge. The driver is located at the right with inside control levers, and quiet and easy engagement of the gears is emphasized.

The body designs have a striking rotund flare from top to bottom, and the interior dimensions from dash to front seat and from back of front seat to rear seats, are such as to provide maximum room and comfort. The upholstery is 12 inches deep and has the latest Turkish roll cushions. The leather is hand buffed, fitted over oil tempered springs on a steel frame. A high grade hair is employed. The toeboard is of aluminum inlaid with linoleum and the tonneau floor is covered with carpet. Ample bellows pockets are provided, and the foot and robe rails are of the adjustable type. All trimmings are black and nickel, and the equipment includes a rain vision and ventilating windshield, tire brackets, jack, tools, etc. A top with Jiffy curtains and a speedometer with clockset combination are listed as extra.

The motor starting system is independent from the lighting generator and energy is supplied to the crankshaft through a train of enclosed gears operating in oil. The system was fully de-

Abbott-Detroit Battleship Roadster, a Radical Departure from Conventional Body Designing.

Digitized by Google

scribed in the March 10 issue. It is operated by a push button located on the toeboard. The lighting generator is driven by silent chain and maintains a 180 ampere-hour storage battery in a properly charged condition.

The standard colors of the Abbott-Detroit models are medium blue, deep Derby red and Brewster green. The chassis is plain black. The company points out that the finish is not only high grade and durable, but 24 operations are required.

The Abbott-Detroit battleship roadster is a departure from conventional body designs as the construction is substantial sheet steel with rows of rivet heads showing. A tire trunk and two extra casings with tubes mounted on spare rims are carried on the deck, these being standard equipment. The radiator of this model differs from the others in that it is V shaped. The product of the Abbott Motor Company carries with it a very liberal guarantee.

VULCAN WINS TRUCK RUN.

Hard Test for Commercial Vehicles Under Auspices of Washington Post.

In the motor truck run conducted from Washington, D. C., by the Washington Post the four-ton Vulcan truck, made by the Driggs-Seabury Ordnance Corporation, Sharon, Penn., was declared the winner of the sweepstakes, on the ton-mile basis used in determining the results. The truck carried one ton at a rate of 1.22 cents for one mile. It was the only one in its division. In the other divisions the winners were as follows:

Division 1 K, 1000 pounds and under, International, ton-mile cost, 3.47 cents; 2 K, 1001-1500, White, 2.38 cents; 3 K, 1501-2000, Wilcox, 2.6 cents; 4 K, 2001-3000, White, 1.4 cents; 5 K, 3001-4000, Atterbury, 1.72 cents; 6 K, 4001-5000 pounds, Rowe, 2.62 cents; non-contesting division, United States ambulances, White, 2.76 cents.

The run was a hard one for all the trucks, which carried their rated load throughout the trip. Bad roads were encountered in many places and numerous penalties were assessed. Six machines were able to complete the road circuit with perfect scores, these being Mais, Wilcox, McIntyre and three Whites. Following the road work the machines were given out-door tests of brakes, clutches, gearboxes and a final examination, and all of these six underwent the tests and passed the examination with clean scores. Then the final result depended upon the amount of gasoline and the number of gallons of oil used. Gasoline was charged at 20 cents a gallon and oil at 45 cents. These costs, together with the loads carried, were used as a basis of computing the ton-mile cost.

NAZARRO TAKES TARGA FLORIO.

Creates New Record for Sicilian Course, Overland Entrant Finishes Seventh.

According to news received from Paris, France, Felix Nazarro, in a Nazarro car, won the Targa Florio two-day race around the Island of Sicily, May 11-12, covering the 620-mile course in 19:28:40. This is over four hours faster than the time made last year by Snipe in a S. C. A. T.

There were 35 starters, among them being an Overland car, two Fords and a Studebaker machine. The Overland, with Lopez driving, finished seventh, being the only American car to complete the required mileage within the 24-hour limit. The cars and drivers, in the order in which they finished, follow:

Car	Driver	Time
Nazarro	Nazarro	19:28:40
Aquilla	Marsaglia	20:43:49
Devecchi	Gloria	21:48:04
De Dion	Berra	22:22:55
Fiat	Giordano	22:26:04
Devecchi	Sivocci	22:47:00
Overland	Lopez	23:12:47
Lancia	Bordino	23:43:45
Isotta	Diana	23:46:00
Minerva	Stabile	23:59:04
Renault	Turner	24:30:00

NATIONAL, SWEEPSTAKES WINNER.

Mercer Takes the Hill Climb and Paige the Fuel Economy Awards.

Twenty cars took part in the West Hudson-Catskill tour, May 14-15, two features of which were a hill climb at Haines Falls, N. Y., and a fuel economy test. The final award shows a National car an all-around winner; a Mercer, the hill climb victor, and a Paige leading in fuel economy. The three elements entering into the sweepstakes award were divided as to points as follows: Reliability, 600; hill climbing, 200; fuel economy, 200. The published results follow:

Car and Driver	Reliability	Climbing	Fuel	Total
National, Poertner	600	139	199	938
Paige, Christopher	600	136	200	936
Alco, Reilly	600	155	173	928
American, Woodhull	600	142	165	907
Ford, Young	600	121	157	878
Oakland, Cooper	600	104	159	863
Ford, Parrott	600	100	152	852
Mercer, Ferguson	525	200	125	850
Mercer, Burdett	600	...	160	760
Pathfinder, Spiegel	85	100	180	365
Briggs-Detroiter, Ross	140	...	186	326

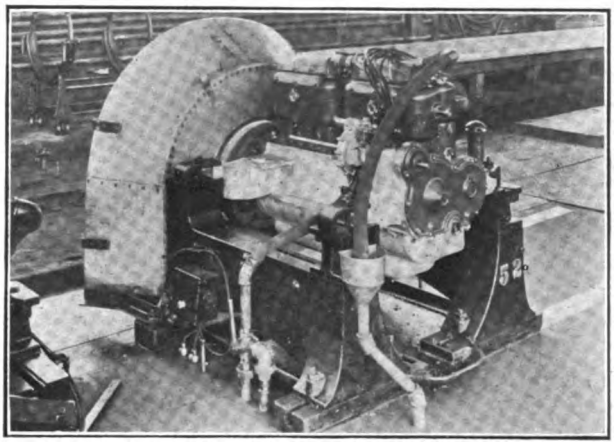
TESTING CONTINENTAL MOTORS.

Various Steps of the Process Require Special Equipment and Safety Appliances.

The testing of a motor is one of the most important and thorough phases of its manufacture by the Continental Motor Manufacturing Company, which concern built a new plant at Detroit recently. In designing this structure the company was determined to have the best, safest and most efficient testing department that modern ideas and skill could provide. No motor is ready for delivery until it has been run in for many hours, both with and without a load, and the severe tests are not only practical and thorough, but calculated to eliminate opportunity for imperfections.



A motor is first run in by belts for four hours before going to the test blocks. In the testing room it is placed on an individual block and operated under its own power for four or five hours. After the oil pan has been removed and the bearings, etc., inspected, the engine is run three hours more and again inspected. The night testers then run the motor throughout the night and under a load. After this test the motor is disassembled, thoroughly examined and adjusted and replaced on the block for the final running and tuning up process.

The block test room is one of the most important departments and presents certain problems that under former methods of manufacture frequently led to dangerous difficulties, in that in testing on the block explosions and fires were likely to occur unless preventative measures were adopted. It readily will be seen that the closing of the department because of a fire would seriously impair the output of the plant.

When a cylinder misses fire, which happens frequently when a new motor is being operated, an explosive mixture enters the exhaust line. The engine on the next block may happen at that time to be taking in a rich mixture, which causes it to send a stream of flame into the exhaust line. This flame, striking the mixture of gas from the cylinder that has missed fire in the other motor, will ignite it and an explosion will occur, frequently setting fire to the lubricating oil discharged from the engine and found at the bottom of the exhaust line. The burning lubricant is extremely dangerous because of the presence of more or less gasoline.

The Continental Motor Manufacturing Company has solved the problem in its construction of its testing room which is one story in height, with monitor roof and so designed as to secure the maximum of light and to be absolutely fireproof. In an accompanying illustration is shown a motor on its block and this is so arranged that it exhausts into a trench which has loose covered plates so that it can be cleaned. These trenches are connected to a large exhaust fan located in another room separated from the testing department by a fire wall. To avoid explosions an opening is left near each engine exhaust, which pulls in fresh air and dilutes the exhaust so that it is too weak to explode.

Metal doors are suspended in each branch of the tunnel, and in case of fire they drop automatically, confining the fire to one section. Refuse oil is drained away from the fan and there is a sprinkler system in the trench. The fuel supply piping is of brass and is located below the

Testing Block in New Motor Department of Continental Motor Manufacturing Company, Detroit—Precautions Are Taken to Prevent Fires by Use of Special Equipment.

floor line. The cooling fluid is circulated by a Union centrifugal pump and the system is elaborate and efficient. It is so designed as to maintain the water at between 160 and 200 degrees, and a thermostatic valve in the storage tank opens automatically at 200 degrees and discharges water. The test stands are built to accommodate different models. Drain pans and pipes collect the spilled lubricant, returning it to the storage tank, where it is filtered. In order to facilitate the handling of the motors an electric crane is arranged to run the entire length of the building. It picks up the engines and places them on the blocks and also delivers them to the shipping department.

The Grand Trunk railroad is considering the installation of motor car service between Buffalo and Bridgeport, Ont., for Sunday travel.

IN THE REALM OF THE MOTORCYCLIST.

Planning for Big Gathering of F. A. M. Members in Middle West---Denver Convention Date Moved One Week Ahead---News Notes of the Industry.

The directors of the Ohio State F. A. M. held an enthusiastic meeting recently and launched plans for an annual convention which it is expected will attract much attention. Because of the great distance to Denver, Col., where the national convention will be held, many motorcyclists will be unable to attend. Therefore a convention in the middle west is believed to meet the requirement of those who cannot go to the national meeting and the Ohio convention will be preceded by four tours, which will draw a great deal of attention to motorcycling throughout the state.

The tours will start simultaneously from the four corners of the state on June 19. The starting points will be at Cincinnati, Marietta, Toledo and Ashtabula. Two days will be allowed for reaching Cleveland and bronze medals of special design will be awarded to those participating in the run. The annual business meeting will be held on the morning of June 21 at Cleveland. A big parade will be held the following morning and it is anticipated that more than 1000 motorcycles will be in line.

The meeting which made arrangements for this event was presided over by State Commissioner J. A. Campbell of Toledo and the other directors in attendance were Edward Hensley of Dayton, secretary; M. E. Remelin of Cincinnati, chairman of the highway committee; Carl Cappel, chairman of the legal action committee; Walker Brown, commissioner for Hamilton county, and F. L. Valiant, chairman of the publicity committee. Others in attendance were George Squiers of Dayton and M. E. Horn, president of the Cincinnati club.

Attleboro Riders on Outing.

An accompanying illustration shows the members of the Attleboro Motorcycle Club, Attleboro, Mass., on one of their recent outings to Lake Pearl, Wrentham, Mass. Those in the picture are, from left to right: Willett, Indian; Whitaker, M-M; Weeman, M-M; Smith, Indian; Gaffney, Harley-Davidson; Park brothers, Indian; Mondor, Indian; McCambridge, Excelsior; Wallenthiem, Harley-Davidson; Fields, Indian; James, Harley-Davidson; Rogers, Harley-Davidson; Woodard, Merkel; Auclair, Harley-Davidson; Spencer, Indian; Swenson, Indian; Kemp, M-M; Fuller, M-M; Stevens, Pope; Cook, special; La Durantey, Indian; Wright, Indian; Broadbent, Indian.

Members of the Attleboro Motorcycle Club, Attleboro, Mass., on Recent Outing at Lake Pearl, Wrentham.

Old Sol Lamp Winners.

Chairman E. M. Estabrook of the F. A. M. membership committee has announced the winners of the monthly contests for Old Sol lamps, donated by the Hawthorne Manufacturing Company, Bridgeport, Conn. The report covers March and April and refers to new clubs which have affiliated with the F. A. M. during that time. The contest will continue during May and June with several fine lamps to be distributed at the end of each month, and is open to all clubs not already affiliated with the F. A. M. The clubs

Digitized by Google

affiliating the largest number of new members receive the prizes. Following are the winners for March and April: Norfolk, Va., two lamps; Hyde Park, Mass., one; Newburg, N. Y., one; West Philadelphia, Penn., one Chicago Indian Club, Chicago, Ill., two; Coldwater, Mich., one; Bayonne, N. J., one; Hornell, N. Y., one.

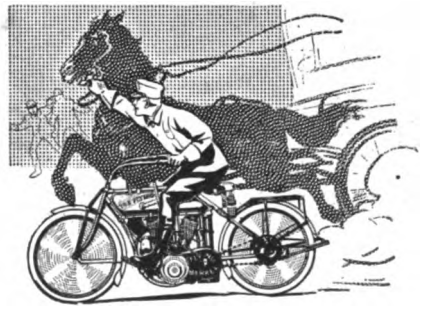
Yale as Business Producer.

Frank E. Miller of Steinle & Miller, Sidney, O., dealer in stoves and tinware, has been using a Yale motorcycle, made by the Consolidated Manufacturing Company, Toledo, O., in his business. He purchased the machine for pleasure and to ride to and from his home, two miles from the store. But he found that calls were frequently received from the country to repair a gasoline stove or set up a new one. He usually covers the distance on his motorcycle in a short time and in case a new stove is to be sent to a house the driver is sent with the team a reasonable time in advance. Mr. Miller follows later on his motorcycle, reaching the house as soon, if not sooner, than the team. This saves the time of an extra man that would otherwise be on the wagon while making the trip. Incidentally, Steinle & Miller get many rush orders which they might not receive if it was not for the Yale machine.

Coming Sanctioned Events.

Sanctions have been requested of the competition committee of the F. A. M. and granted by that body for a series of motorcycle races to be held the week beginning May 25 by the following concerns at the places stated: Stadium Motordrome Company, Riverview Park, Chicago; Luna Park Amusement Company, Luna Park, Cleveland, O.; St. Louis Motordrome & Amusement Company, St. Louis, Mo. Sanctions also have been granted to the same concerns to conduct races at their respective tracks on Memorial Day, May 30. Other sanctions have been given to the Tri-State Racing Company, Canton, and John C. Thompson, Lancaster, Penn., to conduct a race meet in their respective cities May 30, while James Mayo has been granted permission to conduct a meet at Reading, Penn., on June 7.

Racing Riders in Canada.



Chairman J. P. Thornley of the competition committee of the F. A. M., has issued a warning to motorcycle racing riders relative to the situation in Canada which may cause some confusion. He has received information from Toronto, Can., that the Toronto Motorcycle Club has incorporated under the name of the Canada Motorcyclists' Association. This gives the club the same initials which represent the Canadian Motorcyclists' Association. The latter organization is the governing body of Canada recognized by the F. A. M. All riders are warned against riding under the sanction of the Toronto club, which has not asked or obtained recognition from the United States body. It is the duty of every rider to assure himself that he is riding under the sanction of the recognized body and not the Toronto club.

Police Ride Harley-Davidsons.

The police department of Detroit, Mich., has purchased from Harry Svensgaard Sales Corporation, 471 Woodward avenue, 10 Harley-Davidson motorcycles for use by the "Minute Men" of the department. These machines are manufactured by the Harley-Davidson Motor Company, Milwaukee, Wis., and last year the Detroit police purchased 10 machines. The reorder came because of the excellent service rendered by those already in use. They are worked 24 hours each day, three men using each machine in eight-hour shifts.

New Members Last Month.

The number of new members taken into the F. A. M. throughout the United States during the month of April was 836, divided among the various states as follows: Ohio, 149; New York, 101; Illinois, 88; Indiana, 75; Pennsylvania, 58; South Dakota, 56; New Jersey, 50; Michigan, 40; California, 32; Kansas, 20; Missouri, 19; Georgia, 16; Massachusetts, 15; Oregon, 15; Kentucky, 15;

ALWAYS READY FOR ANY EMERGENCY!

With its ability to pick up speed quickly—(60 miles an hour from a standing start within a city block)—the 1913 Flying Merkel Motorcycle is always ready for instantaneous use. These features and the fact that the Flying Merkel Motorcycle is the most economical in the world to operate has led to its universal adoption by Police Departments, Park Boards, Gas Companies, Telephone and Electric Light Companies and all other business concerns and individuals whose requirements demand a sturdy, reliable motorcycle at the minimum cost of upkeep. Remember, the Flying Merkel

W. A. Burnett, Davenport, Ia., and His Flying Merkel at the Old Davenport Home at the Rock Island Arsenal.

Texas, three; Iowa, three; Arizona, three; Rhode Island, two; Minnesota, two; District of Columbia, one; North Carolina, one; Nebraska, one; New Mexico, one.

Touring on Flying Merkel.

The accompanying illustration shows W. A. Burnett of Davenport, Ia., who is employed at the Rock Island Arsenal, Rock Island, Ill., directly opposite Davenport. Mr. Burnett last season made many trips on his Flying Merkel motorcycle, made by the Miami Cycle and Manufacturing Company, Middletown, O., and he has earned a reputation in Davenport as a long distance tourist of considerable ability.

With his wife Mr. Burnett made several tours to Chicago and Minneapolis, Minn., as well as a number of other cities. Both Mr. and Mrs. Burnett found much pleasure in visiting little frequented places while on their tours and the out-of-door air did much to improve their health.

Oscar Hedstrom Retires.

Although Oscar Hedstrom is not connected with the Hendee Manufacturing Company, Springfield, Mass., he will not connect himself with any other motorcycle industry for a period of two years at least, as he has announced that his contract with the Hendee company still has that period of time to run. He has received numerous offers for his expert services, but states that he is not considering any of them. He is resting at his home at Portland, Conn.

Change Convention Date.

It has been officially announced that the date of the annual convention of the Federation of American Motorcyclists will be held at Denver, Col., during the week of July 23-26, inclusive, instead of the week of July 27, as was originally planned. The races will be held the day following the meet, July 27. The directors of the F. A. M. have made the change to one week earlier in order to accommodate those who desire to attend both this convention and that of the Cycle Parts and Accessories Manufacturers' Association in Atlantic City, N. J., Aug. 5.

New Affiliations and Repair Shops.

New clubs which have affiliated with the Federation of American Motorcyclists, follow: Astoria, 18 members; secretary, E. R. Sutton, 585 Duane street, Astoria, Ore. Bucyrus, 26 members; secretary, Robert Carroll, 403 Rensselaer street, Bucyrus, O.

Repair shops registering with the F. A. M. recently include the Allen Arms & Cycle Company, 404 North Oregon street, El Paso, Tex.; George L. Snider, 958 Baker street, Bakersfield, Cal.; Burr & Turner, Dodge City, Kan.

Results in Newark Contest.

The 200-mile reliability run of the Newark Motorcycle Club to Allentown, Penn., and return, resulted in 16 finishing at the home control, among them being Mr. and Mrs. E. B. Holton, with the only tandem which participated. Four teams of three riders each entered the team division. These included the Harley-Davidson, Jefferson, Yale and Indian mounts. The prizes of accessories and manufacturers' trophies will be decided by the scores obtained at the secret checking stations along the route. The two former teams are out of the running in that division because of penalties and the contest is between the Yale and Indian teams. The former is composed of Wilmer Stevens, Ortie Stevens

Herbert Hope, Providence, R. I., and Harley-Davidson with Which He Makes Weekly Trips to Old Home in Lowell, Mass.

and George Riechey, and has won every team contest in which it has participated during the past three years. Eberhardt, Sincox and Haster

Digitized by Google

are the riders who make up the Indian team.

Those who finished were: Herbert Weakliem, Thor; William Sincox, Indian; J. V. Haster, Indian; Mr. and Mrs. E. B. Holton, Excelsior; Watson J. Kliczek, Jefferson; William Allen, Excelsior; P. W. Stevens, Yale; George H. Riechey, Yale; O. W. Stevens, Yale; C. T. Bush, Harley-Davidson; W. Edward McDougall, Harley-Davidson; W. C. Gertimeier, Harley-Davidson; Seth Eberhardt, Indian; Andrew Bohsen, Excelsior; Peter Bohsen, Excelsior.

Pittsburg Opens Season.

The racing season at Pittsburg, Penn., was opened May 10 with a meet at Schenley Oval and despite the raw, cold weather, a large crowd was present and witnessed some spirited contests. Following are the results:

Five-mile novice, stripped stock machines—First, Glenn Wheaton, T. Y. P.; second, Samuel J. Martin, Indian; third, Ade Weixel, Pope; time, 6:28.

Ten-mile open, racing machines—First, A. G. Schmidt, Indian; second, Charles Seitz, Thor; third, Richard Beacon, Harley-Davidson; time, 12:32.4.

Five-mile open, stripped stock machines, no ports—First, Carl C. Kaiser, T. Y. P.; second, John Ponti, Indian; third, George A. Black, R-S; time, not stated.

Five-mile open, racing machines—First, A. G. Schmidt, Indian; second, Carl C. Kaiser, T. Y. P.; third, Charles Seitz, Thor; time, 6:15.2.

Twenty-five-mile open, racing machines—First, Charles Seitz, Thor; second, Carl C. Kaiser, T. Y. P.; third, John Ponti, Indian; time, 32:31.

Good Racing at Denver.

The professional races at Denver, Col., on the Tuileries board track, May 11, brought out a large gathering of spectators and they were not disappointed with the excellent races furnished. All the matches were decided by close margins and resulted as follows:

Five-mile open—First, Fredericks, Excelsior; second, Bruggerman, Indian; third, Fleckstein, Indian; time, 3:29.2.

Five-mile stock—First, Cox, Indian; second, Fleckstein, Indian; third, Stokes, Excelsior; time, 4:07.

Five-mile open—First, Fleckstein, Indian; second, Bruggerman, Indian; third, Stokes, Excelsior; time, 3:49.4.

Club Notes, Here and There.

A 200-mile reliability run was made recently by the Newark Motorcycle Club of Newark, N. J., about 50 riders participating.

Twenty-two members of the Springfield Motorcycle Club, Springfield, Mass., recently made a century run to Albany, N. Y., and return. The return trip was made in 1:10:00.

Members of the New Orleans Motorcycle Club have dedicated a fine club house at New Orleans, La.

The Schenectady Motorcycle Club held its first run of the season from Schenectady, N. Y., to Pittsfield, Mass. A secret time run will be held Memorial Day.

The members of the Amherst Motorcycle Club, Amherst, O., recently held a run to Cleveland, O., a distance of 150 miles. The club was affiliated with the F. A. M.

The Buffalo Motorcycle Club, Buffalo, N. Y., held its first run this season to Springville. Arrangements are being made for a joint run with the Rochester and Lockport clubs.

The Motorcycle Club of Duluth, Minn., will feature hill climbs the coming summer, which will probably be held at Lincoln Park, as it offers a desirable course for such contests.

Initiating actively its new season, the Indian Motorcycle Club, Cincinnati, O., W. E. Horne, president, held its first run to Miamitown, where entertainment was furnished by the Bumiller-Remellin supply house in the form of a chicken dinner at the home of Mrs. A. Bevis.

The St. Louis Motorcycle Club, St. Louis, Mo., has inaugurated a campaign for new members. A successful effort to increase the membership was conducted during the winter by offering prizes to the members bringing in the largest number.

The Missoula Motorcycle Club, Missoula, Mont., was recently formed and it is endeavoring to include in its membership every motorcycle rider in the western part of the state. The charter members are: W. G. Reid, Chris Anderson, George A. Schattenberg, Willard Anderson, Claud Bean, R. S. Walker, George Reeves, C. A. Graybeal and H. A. Bisbee.

Three riders finished with perfect scores out of a total entry list of 21 in the 300-mile durability run of the Savannah Motorcycle Club, Savannah, Ga., held recently. These were J. W. Gregorie on a Thor twin, Martin Schroeder, Thor twin, and W. A. Everett, Harley-Davidson single. In the 200-mile event W. A. McIntyre on an Excelsior twin finished first with 995 and O. A. Meyer on a similar machine was second with 990. Third place went to W. C. Carraway, Indian twin, and fourth to Dennis Downing on a Pope.

O. P. Warlick of the Invincible Motorcycle Club, Brooklyn, N. Y., won the special medal posted for the rider who made the best record in the famous spring run around Long Island, over a course of 200 miles. Warlick rode an Indian machine. John U. Constant of the same club, with a similar mount, achieved practically the same record, subject to a double check. L. N. Vine, Excelsior, was third, and W. C. Hetherington, Jr., Indian, was fourth.

Several hundred motorcyclists attended the annual picture run of the Providence Motorcycle Club, Providence, R. I., held recently, the destination being Roger Williams Park in that city. The day was rather raw and cold, but nevertheless the club members and their guests enjoyed the outing immensely. The previous Sunday between 25 and 30 of the members of the club, headed by Capt. Edward Luther, went to Westerly, R. I., and enjoyed a pleasant run. A stop was made at Wakefield. The majority of the riders were mounted on Indian machines and included in the party were Charles W. Rayhill, first lieutenant; G. W. Lane, second lieutenant; John G. Edwards, secretary of the club, and B. A. Swenson, the state agent for the Indian motorcycle.

1913 F. N. SHAFT-DRIVE MOTORCYCLES.

Lightweight Single, with Two-Speed Gear $275
Only Machine Built With Handle Bar Control of Clutch.
Four-Cylinder $300
With Handle Bar Control of Clutch $350
Two-Speed Gear, Extra $50
Equipment includes two brakes, footrests if desired, compound spring fork, combined luggage carrier and stand.

American F. N. Company, Boston, Mass.

Branch—415 Trumbull St., Hartford, Ct.

JOIN THE F. A. M.

which is the National Organization fostering the interests of motorcyclists along legislative and other lines. Cut this out, mail it, and you will get the reasons.

NEWS OF THE MANUFACTURER AND DEALER.

The following concerns have been incorporated recently to manufacture or deal in motor cars, accessories, etc.:

Hydraulic Transmission Company, Stevens Point, Wis.; $45,000; J. P. Atwell, Benjamin Beijer, Arthur Beijer.

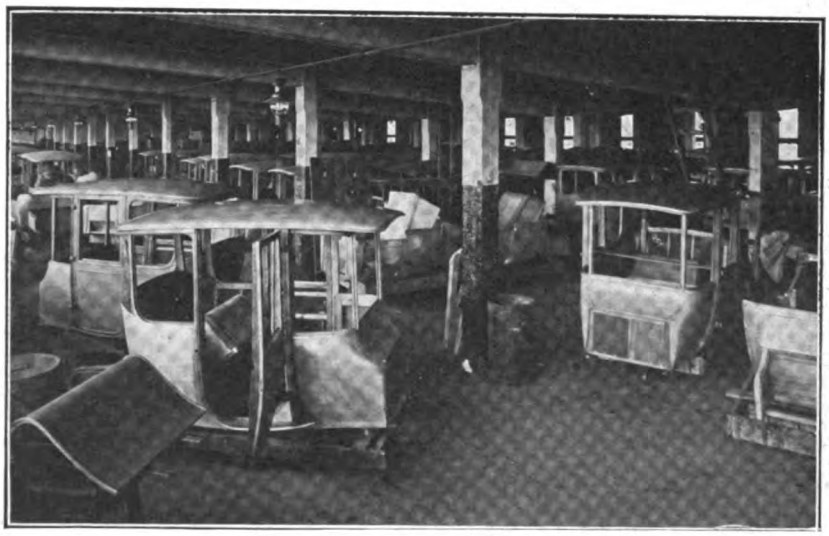
Bierman-Everett Foundry Company, Irvington, N. J.; $125,000; welding supplies; G. Bierman, J. E. Berlanbach, W. H. Mantz.

Miles B. Mank Motor Car Company, Portland, Me.; $10,000; Miles B. Mank, Annie E. Mank, Cecile F. Mank.

Beeler Slide Valve Motor Company, Chicago; $20,000; E. Burleigh Beeler, S. D. Hirschl, M. A. Hirschl.

Michigan Motor Car Company, Memphis, Tenn.; $5000; I. Bennett, C. V. York, J. J. Carrigan.

Prince Street Garage Company, Elizabeth, N. J.; $25,000; Edward S. Fabian, George C. Otto, Alice Byrne.



Cuno Engineering Company, Meriden, Conn.; $50,000; to make safety starters; Charles H. Cuno and others.

Auto Sales Company of Illinois, Chicago; $2000; T. J. Peden, R. C. Merrick, J. W. Yaeger.

Mendham Garage Company, Mendham, N. J.; $50,000; L. K. Hill, E. L. Garabrant, J. M. Hoffman.

Whittemore Cab Company, Brooklyn, N. Y.; $1000; Albert Wald, C. F. Fuerst, W. I. Wiedeman.

Hartford Storage Battery & Supply Company, Hartford, Conn.; $10,000; G. W. Gammack, C. C. Krolin.

Interior of the Aluminum Plant of the Anderson Electric Car Company, Detroit.

Alpha Lamp Company, Newark, N. J.; $25,000; G. A. Furnell and others.

Variable Clutch & Variable Transmission Company, Seattle, Wash.; $100,000; C. E. Lawson, H. A. Emery and others.

Kelsey Wheel Company, Toronto, Can.; $150,000; Malcolm C. Campbell, Oscar E. Fleming, Benjamin J. Cox.

Harris Carburetor Company, Cleveland, O.; $15,000; H. C. Cummings, Fred B. Fishman, John W. Camp, Louis A. Black, Harry Pott.

WITH THE MANUFACTURERS.

The Studebaker Corporation, Detroit, maker of Studebaker cars, has completed plans for a new two-story $60,000 building on the southwest corner of Forest Park boulevard and Boyle avenue, St. Louis, Mo., to be occupied by the company, which has a 15-year lease on the property. Electric elevator and spacious office quarters will be features. The building is expected to be ready for occupancy by July 15.

The Olds Motor Works, Lansing, Mich., maker of Oldsmobile machines, has opened new branches at Pittsburg, Penn., and Atlanta, Ga., as a result of a recent trip by J. V. Hall, sales manager of the company, and it is stated that others in several large centres will soon be opened.

The American Motors Company, Indianapolis, Ind., has made a number of important changes in its sales organization. D. B. Williams, who for the last two years has occupied the position of advertising and publicity manager, has resigned to assume a place in the sales organization as district sales manager with headquarters at Louisville, Ky. G. L. Moskovics, formerly assistant advertising manager under Mr. Williams, takes the place made vacant by the latter's change. E. H. Sherwood, formerly connected with the Mercer Automobile Company, Trenton, N. J., is now connected with the general sales department as assistant sales manager.

The Pittsburg Taximeter Company, Pittsburg, Penn., one of the largest makers of taxicab meters in the country, recently closed contracts to equip all the machines owned by the Detroit Taxicab & Transfer Company and the cars of the Cleveland Taxicab Company. The company also has a large order for its product to be shipped to Rio de Janeiro, Brazil.

The Studebaker Corporation, Detroit, maker of Studebaker cars, has secured the home of the Detroit Curling Club and it is now known as Plant 14 in the Studebaker system.

The Anderson Electric Car Company, Detroit, maker of Detroit electric pleasure cars and trucks, is justly proud of its aluminum plant, in which special presses and automatic hammers have been designed by the company's engineers to handle and form the large aluminum plates to fit the special contours of the Detroit electric bodies. The panels, roofs, window sash, and even the hub caps are now made of this metal. The Detroit plant covers 12 acres of floor space, two large additions having been added recently, while the motors and electrical equipment are produced at the old factory of the Elwell-Parker Electric Company of America in Cleveland.

The Hupp Motor Car Company, Detroit, maker of Hupmobile cars, has announced the resignation of Harry Fosdick as director of sales, that position having been abolished by the company, according to Frederick A. Harris, assistant general manager, who has active supervision over the field policies of the concern. He states that the abandonment of the position of director of sales will entail no further changes or additions to the sales department. R. G. Neighbors, the present sales manager, will continue in charge with his present force.

The Willard Storage Battery Company, Cleveland, O., maker of Elba storage batteries, recently placed its sixth repeat order for Bruce-Macbeth gas engines to be used in furnishing power for operating its plant. Since the installation of the first engine six years ago the company's increasing business has made necessary a new power unit every year.

The Esterline Company, formerly of Lafayette, Ind., has moved its entire plant to Indianapolis, Ind., the new address in that city being 227 East South street.

William Sternberg, engineer of the Sternberg Manufacturing Company, West Allis, Milwaukee, Wis., maker of Sternberg trucks, recently sailed from New York City for a tour of Europe to last several months. He expects to make the trip one of business and pleasure, visiting the more important points in the manufacture of motor trucks abroad, and investigating closely the features and conditions of the industry in general.

E. L. Baker has been appointed resident engineer for the Pacific Coast territory with headquarters at San Francisco, Cal., for the H. H. Franklin Manufacturing Company, Syracuse, N. Y. He was formerly in charge of the mechanical laboratory at the home factory. A. C. Raaflaub, who has been handling the coast territory for the past six months, will return East.

Digitized by Google

Charles B. Shanks, general sales manager of the Kelly-Springfield Motor Truck Company, Springfield, O., has left the factory for a long trip throughout the western part of the country. He will visit all the principal Kelly truck branches and agents west of Chicago.

P. J. Dasey, long connected with the Motsinger Devices Manufacturing Company, Lafayette, Ind., has been made manager of the Detroit branch of the Hartford Suspension Company, where he will handle Hartford electric starters and Truffault-Hartford shock absorbers in the Michigan territory. His headquarters will be at 803 Woodward avenue.

B. M. Sparks, who has been closely identified with the automobile industry for many years, has been engaged as travelling salesman in Nebraska with headquarters at Omaha, for the Haynes Automobile Company, Kokomo, Ind., maker of Haynes machines.

The Hupp Motor Car Company, Detroit, maker of Hupmobiles, finds that even with the addition of the old Grabowsky motor truck plant, which was taken over in February, it still has insufficient room to keep abreast of its orders. Recently a large tent was added for the use of the assembling and testing departments. An accompanying illustration indicates the present activity at the plant, which is now producing 100 cars a day. The business done in April showed an increase of nearly 100 per cent. over any other month in the history of the company.

Frank B. Willis, numbered among the veterans in the automobile industry, having first commenced the sale of cars in 1900, has been appointed general factory representative in all territory east of Denver, Col., for the Lozier Motor Company, Detroit, maker of Lozier cars.

Herbert P. Choate has become sales manager of the Star Motor Car Company, Ann Arbor, Mich., maker of Star trucks. He was formerly connected with the Empire Tire Company, Trenton, N. J. He has made arrangements with George C. Hupp and J. E. Hannon, the latter formerly secretary of the Michigan state fair, to act as Michigan distributor for the Star trucks. They have formed the Star-Tribune Motor Sales Company with headquarters at 815 Woodward avenue, Detroit, where Mr. Choate will be located. Mr. Hupp announces that he is still connected with the R-C-H Corporation, having resigned as an officer to become connected with the manufacture of the Tribune car, a new machine on the market.

F. A. Wade, formerly purchasing agent of the Flanders Motor Company, Detroit, maker of Flanders cars, has been made general purchasing agent of the Maxwell Motor Company, with headquarters at the executive offices in Detroit. Mr. Wade has been associated with Walter E. Flanders for many years, having been with him originally in the Ford Motor Company, and later purchasing agent of the E-M-F company and the Studebaker Corporation in succession.

B. F. Schmidt and L. R. Ingabrand have been advanced from foremen's positions to those of superintendent and assistant superintendent, respectively, in the factory of the Speedwell Motor Car Company, Dayton, O., maker of Speedwell motor cars and trucks. Both men have been with the company since its inception. The former was foreman of the chassis assembling department, and the latter of the final assembling department. Jacob Neibert succeeded Mr. Schmidt as foreman of chassis assembly. The changes came as the result of the resignation of Superintendent Dunston.

GARAGE AND DEALER.

The De Dion-Bouton Selling Branch, New York City, has moved its show rooms to 1612 Broadway, on the northeast corner of Fifty-second street. The garage and repair department is located at 110 West Fifty-fourth street.

The Detroit Automobile Exchange, Inc., a new organization formed to deal exclusively in used cars of high grade, has opened for business at 294 Jefferson avenue, Detroit, where large and well equipped quarters, commodious enough to handle 200 cars, have been obtained in the Sievers & Erdman building. It is a close corporation and the incorporators are: Grover C. Farnsworth, general manager; Everett W. Pingree, secretary and treasurer, and Robert M. Drysdale. Mr. Farnsworth, who will devote all his time to the business, is widely known in the automobile industry, his experience covering several departments.

The Pittsburg Chalmers Company, Pittsburg, Penn., has moved from its former home at 5932 Baum street to 220 North Negley avenue. The Pittsburg Michigan Motor Car Company has moved to 5864-5866 Baum street. A new building has been erected at this address and will be known as the Automobile Palace.

R. D. Maxwell has been appointed manager of the Studebaker branch retail store at Los Angeles, Cal.

George A. Crittenden, for a number of years connected with the Boston branch of the Lozier Motor Company, Detroit, maker of Lozier cars, has been appointed manager of sales of a Boston office established by the new Chandler Motor Car Company, Cleveland, O., maker of Chandler cars. Mr. Crittenden attained great success with the Lozier company, having on Jan. 1 been declared the winner of the annual prize among all Lozier salesmen. The officials of the Chandler company were all until recently executives of the Lozier company and were familiar with Mr. Crittenden's fine work.

William Ziegler, Darien, Conn., is having a large garage erected which will cost $150,000. It will be equipped with all modern appliances, including electric elevator, etc.

Indicating the Every Day Activity at the Factory of the Hupp Motor Car Company, Detroit.

George A. Kershner, owner of the Berkley garage at Martinsburg, W. Va., is to erect a large garage on West King street. It will be modern throughout and will cost $32,000.

The Kolb Sales Company, with offices in the United States Rubber building, Fifty-eighth street and Broadway, New York City, was recently organized to represent the interests of different automobile accessory and specialty manufacturers in the eastern territory. Milton B. Kolb, who has been identified with various branches of the industry the past 10 years, is at the head of the new organization.

W. A. Buckley, postmaster at Sprague, Wash., has purchased the Sprague garage, and will operate the same.

The Wright-Callender-Andrews Company, Los Angeles, Cal., has leased its garage building at 23 East Fifth street to L. H. Larson, who will operate a garage.

The Stewart Motor Corporation, Buffalo, N. Y., recently appointed the following dealers to handle Stewart light delivery cars: Fred H. Van Dorn, Red Bank, N. J.; Draper Garage, Northampton, Mass.; G. E. Clark, Herkimer, N. Y.; H. B. Gray Company, Fort Plain, N. Y.; Johnstown Motor Car Company, Johnstown, N. Y.; William Petry Garage, Hudson, N. Y.

RECENT PATENTS.

Illuminating Appliance, Otis A. Mygatt, New York City, No. 1,061,100. An illuminating appliance comprising a glass inclosure having below its upper edge an interior support and a reflector with the same held by said support.

Worm Gearing, Charles H. Myers, Buffalo, N. Y., No. 1,060,933. A worm gearing comprising a worm and a worm gear wheel, the latter being provided with teeth composed of spheres bored diametrically with a counterbore at each end of the diametric bore, a screw traversing the bore of each sphere and carried by the gear wheel, and anti-friction balls lodged in the counterbores at the ends of the main bores of the spheres.

Tire Tool, Charles S. Edwards, Prineville, Ore., No. 1,059,128. A tire tool having a spoke gripping member, a lever co-operatively connected to said member, a prying element longitudinally slidable upon the lever and including a member for engaging and shifting the detachable flange in advance of engaging and prying off the tire, and means for advancing the said prying element as the tire is shifted.

Tire Chain, Douglas J. Martin, New York City, No. 1,059,182. In an anti-skid device, a series of spaced apart open endless chains disposed about the tire of a wheel, means for retaining each chain in open position, said means comprising closed elliptical springs passing through links of the chain of each side of the tire, and means passing through said links of the chain and connecting the chain with the next adjacent chain.

Turntable Attachment, Ferdinand Helder, New York City, No. 1,061,073. An improved turntable attachment for automobiles, comprising a foot piece, a supporting post rotable in said foot piece, means for lowering the foot piece to the ground and simultaneously raising the automobile in respect to the foot piece, means for locking the supporting post to the foot piece, and a planetary gear for rotating the automobile around the supporting post after the same is interlocked with the foot piece.

Muffler, Ernest M. Kluck, Buffalo, N. Y., assignor of one-half to Nicholas C. Newerf of the same city, No. 1,060,768. It is in combination with an exhaust pipe, of a pipe substantially the same size as the exhaust pipe detachably fastened to the rear end of the exhaust pipe and forming a removable continuation of said exhaust pipe, and a cylindrical muffler of larger circumference than the detachable pipe connected throughout its length to one side of and having slotted communication with said exhaust pipe.

Bolt for International Combustion Engines, Douglas V. Ashley, Binghamton, N. Y., No. 1,059,103. A bolt for securing together the head and the cylinder of an internal combustion engine, said bolt having a head to engage the outer surface of the cylinder head, a cylindrical shank of length sufficient to pass through the cylinder head and enter a tapped hole in the cylinder, screw threads upon that portion of the shank which is to enter said tapped hole, a passage extending lengthwise of said bolt head and shank, and a hole entering said passage from one side of said shank.

Valve Structure, Marshall E. Morel, Sheridan, Ill., No. 1,058,996. The combination with a gas engine of a valve chamber having an upstanding flange on the bottom, a plug closing said chamber and having a downwardly extending flange, a rotary cylindrical valve in said chamber bearing upon said bottom and said plug and maintained in position by said flanges, a plurality of piston rings on said valve, a plurality of webs arranged transversely in said valve and bracing said valve against distortion, cone surfaces formed on the outer and lower upper edges of said valve, bearing rings confined in the spaces between said cone surfaces and said plug and valve bottom respectively, and balls confined between and bearing on said rings and cone surfaces.

COMING EVENTS.

May.

May 26-June 13—American visit, British engineers.
May 27-28—Hill climb, Atlanta, Ga.
May 27-28—Reliability run, Chambersburg, Penn.
May 29-30—Inter-Club run, Chicago, Ill.
May 30—Track meet, White Plains, N. Y.
May 30—500-mile race, Indianapolis, Ind.

June.

June 7—Inter-Club run, Philadelphia, Penn.
June 10—Reliability run, Columbus, O.
June 14-15—Track meet, San Francisco, Cal.
June 16-18—Reliability run, Columbus, O.
June 19—Algonquin hill climb, Chicago, Ill.
June 21—Stanley avenue hill climb, Cincinnati, O.
June 21-22—Track meet, Portland, Ore.
June 23—Reliability run, Des Moines, Ia.
June 25-28—Non-stop day and night run, Chicago-Boston.

July.

July 1—Manufacturers' tour, Indianapolis-San Francisco.
July 4—200-mile race, Columbus, O.
July 4—Track meet, Taylor, Tex.
July 4—Panama-Pacific road race, Los Angeles, Cal.
July 4—Track meet, Washington, D. C.
July 4-5—Track meet, Sioux City, Ia.
July 4-6—Road race, Tacoma, Wash.
July 11-19—A. A. A. tour, Minneapolis-Glacier Park.
July 20—Track races, Seattle, Wash.
July 21-25—Tour, Seattle, Wash.
July 27—Tour, Grand Rapids, Mich.
July 27-28—Road races, Tacoma, Wash.
July 28-30—Beach races, Galveston, Tex.

August.

Aug. 12—Reliability run, Kansas State Automobile Association.
Aug. 29—Chicago Trophy race, Elgin, Ill.
Aug. 30—Elgin Trophy race, Elgin, Ill.
Aug. 30-Sept. 6—Reliability tour, Chicago, Ill.

September.

Sept. 1—Fire chiefs' convention, Madison Square Garden, New York.
Sept. 1—Track races, Columbus, O.
Sept. 12—Track races, Youngstown, O.

October.

Oct. 4-11—Around Lake Michigan tour, Chicago Motor Club.

November.

Nov. 24—Vanderbilt Cup race, Savannah, Ga.
Nov. 26—Grand Prize race, Savannah, Ga.

FOREIGN.

June.

June 4- 6—Tourist Trophy race, Isle of Man, England.
June 10-16—Alpine trials, Vienna, Austria.
June 23-28—International road congress, London, England.

July.

July 1-16—Plowing competition, Winnipeg, Manitoba.
July 12—Grand Prix race, Amiens, France.
July 19-20—Grand Prix race, Belgium.

August.

August 10—Hill climb, Mount Ventoux, France.
August 15—Hill climb, Tonale, Italy.

September.

September 28—Hill climb, Mont Verdun, France.

NEW BOOKS RECEIVED.

Dayton, a Story of the Great Flood—A brief but interesting history of the recent flood, comprising 32 pages, fully illustrated with photographic reproductions, published by the Dayton Engineering Laboratories Company, maker of Delco systems. The booklet is printed by the Franklin Press, Detroit.

Topographical Maps—The United States Geological Survey, Washington, D. C., is issuing topographical maps for motorists, these being of a size suitable for carrying in the car at all times. They not only give the location of all towns, villages and hamlets and all the roads covering each district, but by their use the motorist is able to tell at a glance whether the road will be level or rolling, steep or hilly, etc. Those desiring information concerning the maps should make application for descriptive indices, designating the states covered by the inquiry. Price, 10 cents each.

Correction—In the description of the Havers car, appearing in the May 10th issue, it was stated that ignition was by a Bosch high-tension magneto, dual system. This is an error as the Havers chassis is equipped with an Eisemann high-tension dual ignition instrument, made by the Eisemann Magneto Company, New York City.

MOTOR EXCEEDS RECORD.

Standard Packard Engine Running 300 Hours Utilizes Bosch Ignition.

The standard "38" Packard motor, which has been undergoing a prolonged non-stop test at the laboratory of the Automobile Club of America, in New York City, exceeded all previous records of this character. Four years ago a motor was run for 132 hours in England. It was the original intention to run the Packard motor for 200 hours, but it was later decided to continue the test for 300 hours, which were completed May 16. Two spark plugs were changed, and two adjustments were made to the exhaust valve tappet on the No. 1 cylinder. A small leak in the fuel line also developed, but not enough to cause damage. The motor maintained a constant speed of 1200 revolutions a minute, held to be equivalent to pulling a fully loaded car at a speed of 37.46 miles an hour.

Of particular interest in connection with this test was the performance of the Bosch magneto, with which the motor was fitted. This was a type DU6 instrument, and it was operated throughout the 300 hours without attention. It is estimated that the magneto armature revolved 32,400,000 times, which means that 64,800,000 sparks were furnished to fire the charges, and that 129,000,000 separate movements of the interrupter arm were made. The result of the test is highly gratifying, both to the Packard Motor Car Company, Detroit, and the Bosch Magneto Company, New York City.

RECOVERS FROM DAYTON FLOOD.

Maker of Dayton Airless Tire Claims Honor of Being First to Resume Shipments.

The Dayton Rubber Manufacturing Company, Dayton, O., maker of Dayton airless tires, although submerged in 18 feet of water during the recent flood, claims the honor of being the first company in Dayton to resume shipments. During the flood J. A. MacMillan viewed the plant from his home, through strong field glasses and immediately telegraphed to New York City and other eastern points ordering several tons of rubber and other materials shipped by express. By the time the factory was cleaned up the fresh materials had arrived.

Superintendent Witsaman was sent to Akron, O., where he secured an additional force of expert tire builders and the factory is now producing more tires than before the flood. In a few weeks a night force will be put at work as the demand is rapidly increasing. Recently a shipment of Dayton airless tires was made to Copenhagen, Denmark, while others have been made to New Zealand, the Philippine Islands, Rio Janeiro and the City of Mexico.

STILL IDENTIFIED WITH CONCERN.

Sole Surviving Studebaker Brother Is Regarded as Expert on Automobile Woods.

J. M. Studebaker, the sole surviving brother of the five who developed the business of the Studebaker Corporation, Detroit, and South Bend, Ind., maker of Studebaker trucks and pleasure automobiles, and horse drawn vehicles, is now nearing his 80th birthday. Several years ago he withdrew from active responsibility of the routine order, but he still takes a keen interest in the business of the concern.

Among the brothers, J. M. was the manufacturer; Clement, father of the present vice president, was the general executive, and Peter was the sales manager. J. M. Studebaker is today recognized as one of the leading authorities on the different kinds of wood used in vehicle and automobile construction, this knowledge being of great value to the designers of Studebaker cars. One of his self-assigned tasks is the selection of the wood which forms the base of the automobile running boards, body braces and dashes, much of which comes from the yards of the corporation at South Bend, where it has been seasoned by special processes for many months. Mr. Studebaker's chief regret is that he was not born 20 years later in order that he might have identified himself with the automobile industry in a more active way.

Flaring red signs, 22 feet in length, with the word "school" painted in white letters are advocated to be placed on every road at the approach to a school building by the Automobile Legal Association as a warning to automobilists to slow down. Circular letters have been sent to the mayors and selectmen of each city and town asking that the signs be placed.

The details of the annual pilgrimage of the Bay State Automobile Association, Boston Mass., to Lake Spofford, N. H., June 16-17, are being arranged by President E. A. Gilmore and the tours committee, W. H. Stevens, Walter Williams, Chase Langmaid and M. E. Lebon.

PRESIDENT JOY ON PRICE MAINTENANCE.

IN AN address before the Association of National Advertising Managers, May 14, Henry B. Joy, president of the Packard Motor Car Company, Detroit, again took up the subject of "Price Maintenance," which he discussed somewhat fully in recent motoring publications as affecting the purchaser. It is interesting to note in this connection that General Manager Alvan Macauley of the Packard company has addressed the following letter to all dealers representing the product of that concern:

We have had a call recently from a special agent of the Department of Justice, who was inquiring with reference to our policy of maintaining our "square deal" one-price policy. It is very possible that as our dealer you may be interviewed in this connection; and this is to say that you have nothing to conceal, and should you be visited by any official in regard to this matter, you are at liberty to state the facts as fully as you please.

In the address mentioned above, Mr. Joy said in part:

Business sadly needs some constructive advocates. The false and the stupid prejudice against success is responsible for much of our trouble. Why should this prejudice be allowed to exist? The actual dollar is simply the measure or yardstick and worthless in itself.

Created wealth, in order to remain wealth, must produce something net. The more created wealth in America the more work and the more business must be done to maintain that wealth in existence at all. The great created wealth of the country is the asset of the whole people and the basis and measure of our prosperity.

The attitude of the government toward industrial evolution of recent years has brought about conditions which require our most serious consideration. The United States has led the world in rapid stages of humanizing development in many ways. Our republican ideas of self-government have made our whole nation a forum for debate on ways and means to curb the strong and protect the weak.

Railroads, at first free to make money as private enterprises, have grown into corporations of such public interest and affecting so universally the public welfare that they are practically directed by the national government, but operated and owned privately. What was for upwards of half a century praised as successful enterprise in railroad building and management came to the point of breaking down by reason of what we now know as unfair competition.

The heads of railroad companies, after periods of vicious warfare, when their treasuries became depleted, and with failure and ruin staring them in the face, repeatedly got together and restored by agreements rates of transportation to high levels in an effort to recoup themselves for the losses of the battles which had raged.

These rate agreements could not be maintained. One railroad would soon again cut rates by private concessions to special shippers. Then others would follow as the perfidy became exposed. And another period of ruthless rate wars would recur and the destruction of the nation's wealth was incalculable.

Finally to mitigate these evils, so fatally affecting general business as well as the railroads themselves, the national government, as the result of popular will, educated by the press, provided that rates should be the same to all, that rebates, free passes, cut rates and special privileges should be things of the past. We eliminated the evils of private ownership of railroads without adopting the equally or more objectionable plan of government ownership.

Then the next stage of industrial evolution came. As railroad facilities improved, transportation quickened, towns, cities, states and nations were brought marvelously closer together. The growth of the telephone service was a revolution.

A condition was thus brought about in manufacturing industries as had been the case with the railroads where the same unfair competition brought also the stage of mutual agreements between manufacturers to maintain prices exactly as railroads had tried to do without success. Gentlemen's agreements would be broken. Unfair competition to destroy each other would again become rampant and untold countless millions of constructed wealth would melt away.

Then in utter self-preservation, companies that had fought and suffered as the bitterest trade enemies only can, were brought together by friendly mediation, and consolidations were accomplished in a small way. The advantages and possibilities became recognized. So-called trusts came on the scene.

Prices became more stable, and the business of all our people could be conducted with greater safety and certainty. Dealings in securities were however carried on on a colossal scale, and the popular mind could not differentiate between the good which the so-called trusts have yielded and the harm and discredit which was reflected on them by the manipulation of their securities. The "rules of the game" have been changed—are being changed. The benefits are rising to the surface and becoming apparent to all who will examine and study.

We have come to know that mere bigness is no crime. We have come to know that stable prices, even though made by so-called trusts, are a vast benefit compared to the feverish variations and uncertainties of the cut-throat competition days.

Now, let us look with clear, unprejudiced eyes at today's conditions. Let us keep the good. Let not prejudice blind us. Let us act wisely in modifying and mitigating existing evils that remain. These evils are not as bad as class-prejudice-fomenting publications and some politicians would have us believe. Private rebates, cut prices, special concessions, have been much mitigated. The conditions today are better to an almost infinite extent than before the consolidations of the trust era.

It is true, also I believe beyond a doubt, that there is vastly more unfair competition and price cutting practised by smaller businesses and smaller corporations today than by the so-called trusts. Personally I do not like to buy anything except from a one-price house, with the price marked on the goods. There is not an article that I personally may want to buy but that the dealer in it is expert and keen as to its real value. The average layman in the very nature of things cannot know these values. He is not an expert. It is not his special business.

Business men are more and more "putting themselves in their customers' places" and trying to treat them as they would like themselves to be treated, were conditions reversed. That is the golden rule of business.

But, you truthfully reply, that that rule cannot always in all businesses be maintained and then only by the stronger concerns, because the unscrupulous advertiser, the sharp dealer and price-cutter will get your business away from you, and you must meet unfair competitive methods with unfair competitive methods.

Let us analyze this situation. In the first place, it is true in the main. As a general proposition, unfair competition will tend to drag the idealist in business to the level of the unfairest practises in the fight for self-preservation in the last analysis. Except only for one thing: Namely, that business men be permitted to form associations for the amelioration of these "unfair" conditions. Schemes proposing unfair competition do not sound well when discussed in open meetings of business competitors.

But it is argued, in the fashionable phraseology of the day, such methods would be monopolistic and conspiracies in restraint of trade and unlawful. Such methods actually would be in promotion of honest trade and tending to the protection of the consumer, and the retailer as well.

A specific law prohibiting the sale of goods at less than cost is obviously absurd. Business exigencies occasionally require it. Such laws do no good, but only harm. An excess production of last year's bonnets would necessarily require a slaughter sale or a fire. We cannot overturn the natural laws of business without suffering and disaster. Associations, it is believed by many, can work out the wisest solutions of such problems for each line of industry and trade, in co-operation with a proper government commission.

Digitized by Google

What do consumers and business men face today under the present attitude of the government and Department of Justice? Except that it involves protracted litigation, they do not know! I mean by that to say that they do not realize what is so insidiously being done to the businesses of all our people. They are not awake to the portending commercial and industrial revolution. The attitude of the government, as shown in pending litigation, is, concretely, that "the control of retail prices by manufacturers must cease."

When prices are cut by unfair competitive methods, who pays the bill? Absolutely the consumer is the victim ultimately and continuously.

You will fairly concede that a retail store must make a profit. They make profits of course or they could not exist. When a retail store sells an article below a proper profit, or at cost, or below cost, by reason of favoritism, or desires to accommodate the customer in order to retain his trade in other lines, or to put a competing store out of business across the street, or to run it as a leader for advertising purposes, in order to attract customers for other goods at high prices, what does it mean?

It means simply that by sharp business that retailer to make his necessary average profit must and does, first, sell to the trusting customer, or inexperienced purchaser, when he can, that same article at more than its real worth, or, second, the retailer must and does sell other articles at more than their real retail worth. Naturally he probably does both. There is no other answer; he must do so or fail!

No retailer or manufacturer desires to conduct his business along such lines. Those who do are forced to do so by the unfair competition of other retailers or by manufacturers who do not protect their retail prices. Business integrity and known fixed prices have been inseparable companions.

CAMPAIGN OF EDUCATION.

American Highway Association Inaugurates One in Interests of Good Roads.

Following the recent publication of the Good Roads Year Book, which presents the road situation in the United States to date, the American Highway Association has begun the issuance of a series of instructive papers presenting the most important phases of road improvement from the standpoint of both the layman and the engineer. Among the first to be issued is a reprint of the address by W. W. Finley, president of the Southern Railway, at the recent American road congress on "Good Roads and the Cost of Living."

Mr. Finley holds the cost of living is largely an economic question and that efforts should be turned toward increasing the area of farm land under cultivation and the yield of farm products an acre. He points to the well known fact that prospective farm settlers are largely governed by railroad and public road facilities and that when these are not adequate farm operations are discouraged. Obviously, good roads permitting the easy use of motor cars largely solve the problem.

The American Highway Association is composed of upwards of 2000 of the leading men and women of the nation and is conducting a campaign of good roads education and reform throughout the United States. Its president is Logan Waller Page, director of the United States office of public roads, and its secretary is J. E. Pennypacker, formerly chief of road management in the Department of Agriculture, and later chief statistician for the joint congressional committee on federal aid in the construction of post roads. The headquarters of the association are in the Colorado building at Washington, D. C.

"FULLY EQUIPPED—NEARLY."

Weed Chain Tire Grip Company to Inaugurate New Advertising System.

The careful attention to detail which has marked the presentation of the merits of the Weed tire chain in the advertising of its maker, the Weed Chain Tire Grip Company, New York City, has been such as to win the appreciation of motorists and those interested in raising the factor of safety in motoring. Not only have the arguments been carefully thought out, but the treatment has been with that artistic effect which serves to make a lasting impression.

Announcement is made by the company that it shortly will inaugurate a new system of advertising which will call for an even greater attempt at originality than has been manifested heretofore. The effort in this instance will be to carry conviction to both the owner and manufacturer of automobiles, and it is understood that the first appearance of the new series will be under the heading, "Fully Equipped—Nearly," in the issue of Collier's Weekly for June 7.

INCREASES CAPITAL STOCK.

Regal Motor Car Company Is Authorized to Add $2,000,000.

Stockholders of the Regal Motor Car Company, Detroit, maker of Regal cars, have approved a plan which involves increasing the capital from $1,000,000 to $3,000,000. Of the total, $2,600,000 has been subscribed for and paid in, while $400,000 of the authorized issue will be held in reserve to provide for future extensions of the company's business.

Fred W. Haines has been elected president of the company, retaining also the title of general manager, which he previously held. Directors of the company include Charles R. Lambert, Fred W. Haines and Harold H. Emmons, who assisted in the organization of the company in 1907.

The Pittsburg Automobile Dealers' Association will hold a pleasure car and truck display in October.

HARROUN CARBURETOR.

New Vaporizer Was Used on Overland Car in Recent Tests.

In the recent test of his new carburetor, the results of which were published in these columns, Ray Harroun, the well known racing driver and winner of the 1911 500-mile race at Indianapolis, Ind., used an Overland car, made by the Willys-Overland Company, Toledo, O.

The Harroun carburetor will be used on two Henderson machines, made by the Henderson Motor Car Company, Indianapolis, entered in the tour of the manufacturers from that city to the Pacific Coast.

THE HAYNES PIONEER.

Announcement That Maker of Haynes Cars Will Issue Unique Publication.

The aggressive policy noticeable in the conduct of the Haynes Automobile Company, Kokomo, Ind., maker of Haynes cars, since the reorganization of its sales department, is further emphasized by the announcement that a house organ, devoted to the interests of Haynes owners, distributors, dealers and the automobile world in general, will be published for the first time July 1 and thereafter will be issued monthly by the company.

The initial number will contain a resume of the life and work of Elwood Haynes, the builder of America's first car, now in the Smithsonian Institute at Washington, D. C., and officially designated as the "Pioneer." A history of the car itself is also given, and reminiscent of Mr. Haynes' work, the publication will be called "The Haynes Pioneer." The early issues will contain a series of articles from the pen of Elwood Haynes, relating to the advent of the automobile in America. Already the company has had thousands of applications for copies of its new paper.

SMITH SUCCEEDS WARREN.

Changes in Personnel Among Officers of Indiana Automobile Manufacturers' Association.

The resignation of C. B. Warren, president of the Indiana Automobile Manufacturers' Association, has been accepted by the board of directors and H. O. Smith of Indianapolis, Ind., president of the Premier Motor Manufacturing Company, maker of the Premier cars, a man of national importance in the automobile world, was elected as head of the organization, which is making motor car history by its coming tour to the Pacific Coast and its plan for a national highway from the Atlantic to the Pacific.

Carl G. Fisher, Indianapolis millionaire sportsman of Speedway and Prest-O-Lite fame, and the originator of the plan for automobile manufacturers to build an all-the-year-around highway across America, was chosen a member of the board of directors. R. P. Henderson of the Henderson Motor Car Company, maker of Henderson cars, was selected as tour treasurer.

AN APPRECIATIVE ALLEGORY.

Cole Motor Car Company Publishes Work from Pen of Homer McKee.

Homer McKee, the well known director of advertising and sales for the Cole Motor Car Company, Indianapolis, Ind., maker of Cole cars, has written an appreciation relative to the motor car, having in mind the fact that man had to develop 6000 years before he evolved this mode of travel and service. Mr. McKee displays what amounts to reverence for the invention of the automobile and his short essay, in the form of an allegory, has been published in folder form by the Cole company. On the title page is inscribed, "Its Origin," and the text, printed within a border of gold, follows:

Among the various things to which the earth is heir there is a great Brain which dreams and a great Hand which DOES. And the great Brain works with the great Hand, not for you nor for me, but for MAN. The great Brain and the great Hand made space and time, and designed these to be the eternal enemies of man.

Then the great Brain and the great Hand agreed that man should never yield to his enemies, Time and Space, but should fight on and on until some mighty weapon of annihilation should be discovered.

Thus it came about that the strength of the oak, the speed of the winds, the soft, pad-footed stealth of the panther, the tirelessness of the seasons and the beauty of vines that cling were gathered together by the great Brain and the great Hand and put into a single thing which should be the all-powerful servant of man. And they called the thing—the Motor Car.

A recent internal combustion engine research proved that it takes .01 second to fill the cylinder of a racing motorcycle with gas, according to A. H. Bartsch of the Bosch Magneto Company, New York City, maker of Bosch magnetos, and less time to fire the charge. "This being so," he says, "it surely proves what a phenomenal machine the magneto is, to be able to generate current so rapidly and so efficiently as to fire a complete charge of gas in less than .01 second."

EMPIRE AS PATHFINDER.

Five-Passenger Little Aristocrat Selected for Iowa's Little Glidden.

Announcement is made by the Iowa State Automobile Association that the pathfinding car for this year's Little Glidden tour, as the annual endurance test of that organization has come to be known, is a five-passenger Empire Little Aristocrat, made by the Empire Automobile Company, Indianapolis, Ind. This is the first important tour in which this make of car has figured so prominently.

The event is scheduled for the early part of June, and it is expected to cover some 1050 miles. J. E. Robinson, sales manager for the Iowa distributor of Empire cars, will drive the machine on the pathfinding tour, and also as pilot car in the tour itself.

HOOD GOES TO COAST.

Seeks to Learn Interest of Dealers and Others in Manufacturers' Tour.

Representing the Westcott Motor Car Company, Richmond, Ind., Wallace C. Hood, general manager of that company, is visiting the Pacific Coast in an effort to determine the amount of interest being shown by the dealers and commercial organizations in that section of the forthcoming transcontinental tour of the Indiana Automobile Manufacturers' Association. Upon his report will depend in a large measure the action taken by the Westcott company with reference to the tour.

Mr. Hood has a large acquaintance on the Coast, this having been gained through former visits, made when he was connected as sales manager with the Chalmers Motor Company and the Metzger Motor Car Company. He will stop en route at Salt Lake City, Sacramento, San Francisco, Oakland and Los Angeles, and expects to include Portland, Seattle and Spokane in his itinerary before returning to Richmond.

The Downing-Detroit Motor Company of Detroit is bringing out a racy type of cyclecar, the power plant being of a 10-12 horsepower, long stroke design. The tread is standard with wire wheels and one chassis will be produced with a choice of either tandem or single seat. Arrangements are being made to produce these cyclecars in large numbers.

STUTZ

The Stutz is Quality Built

Every STUTZ car is built with as much care and pains as the costliest watch. Every ounce of material—every detail of workmanship that goes into the STUTZ is absolutely the best.

There are so many satisfied STUTZ owners throughout the country that we are not spending a nickel for national magazine advertising—we have demands for more cars than we can produce under our careful painstaking system without it. We are putting that cost into STUTZ QUALITY.

We are building less than 1000 cars—we have demands for three times that many.

If we built more cars we could not give the attention to the many details—such as are easily slighted in a great organization burdened with quantity production.

We could not build in quantities without sacrificing the QUALITY—and we would not sacrifice the QUALITY of one STUTZ car for the greatest quantity production in the industry. We would far rather be known as QUALITY producers.

There is no watered stock—no costly branches to maintain in the STUTZ organization.

Every nickel of STUTZ purchase price is given back to the user in STUTZ QUALITY.

These are the reasons for the superior quality of STUTZ cars—the reasons why the STUTZ gives genuine service—the reasons why every STUTZ owner is proud of his car no matter in what company he associates.

20 Miles to Gallon

Lawrence, Mass., July 13, 1912.
Gentlemen:—Enclosed find check for carburetor. I feel perfectly satisfied. It does 20 miles and over on a gallon. Can recommend it to anyone. G. A. Schmidt.

19 to Gallon on Cadillac

Planhard Co.—Edgewater, N. J., May 21, 1912.
I am very much pleased with my new Planhard Carburetor. I made a test of gasoline consumption from Edgewater to Hyde Park, N. Y., and return, and got a fraction over nineteen miles to the gallon. This is on my Cadillac.
John H. Hinners.

More Speed—Start Cold

Groton, Conn., Feb. 8, 1913.
Dear Sirs:—I put a Planhard on my single cylinder 6-8 h. p. Goshen engine. It gives 50 R. P. M. more than the ——— I took off. With the Planhard I can start cold or hot without priming, which few others can do.
Yours truly, E. A. Scriven.

3¾ More Miles

When Planhard Carburetors were put on the 6 cylinder, 4 cycle Frisbie motor of the fast boat Delphi II, she increased 230 R. P. M., and 3¾ more miles per hour.

Much More Power

Bath Marine Construction Co.—"The gasoline consumption at normal power was better than others and it would develop much more power when pushed." H. D. Bacon, President.
"Fifty miles without a miss."—Geo. E. Grosvenor, Crescent, Mich.
"To use the vernacular, 'some carburetor.' "—W. R. Fleming, 3311 Broadway, N. Y.

If you own a FORD!

Chicago, Ohio, July 1, 1912.
Gentlemen:—The Planhard Carburetor for my model S Ford Car is very satisfactory. I never bought anything for my car I paid so cheerfully for, as I have a smoother running engine with more power and get *more mileage per gallon* and my engine runs much cooler. H. W. Grandon.

Gallon Less Per Hour!

What a FORD OWNER Says About the M&M Economizer

Patented America

Salisbury, Md., Feb. 18, 1913.

Moller Bros., Philadelphia, Penn.

Gentlemen:—It gives me pleasure to reply to yours of the 12th, in reference to the M&M Economizer. I use it on a FORD Runabout, 1913 model. The last one I ordered is for a Ford Touring Car, 1913 model. I estimate that it saves me 25% of gasoline. It is very useful in turning corners and descending grades, and is a much better primer than any spark plug primer I have ever seen. No trouble to start a car on a cold morning, when it is equipped with the M&M.

(Signed) Yours very truly, P. S. SHOCKLEY.

WHAT YOU CAN DO WITH THE M&M ECONOMIZER—

YOU can obtain 20% more speed with the M&M THAN YOU CAN WITHOUT IT.
YOU can develop MORE POWER in high altitudes.
YOU can keep the cylinders clean, and cool your engine at all times.
YOU can use the M&M just like the coaster brake on a bicycle.
YOU can use it as an air brake on grades, at the same time taking off the ignition.
YOU can save wear and tear on clutch, brakes and tires.
YOU can increase your SPEED and POWER without touching your throttle.
YOU can immediately secure the proper mixture for different weather conditions without readjusting the carburetor.
YOU can set your throttle at 12 miles per hour, and increase it to 18 or 20 miles, with the same amount of gasoline, and less carbon, SIMPLY by opening the M&M.

The M&M is inserted into manifold. The automobile size requires a ¾" pipe tap to insert, but can be reduced to ½" by means of an elbow or a common reducer. The motorcycle size is ¼".

PRICE OF AUTOMOBILE SIZE—$3.50 and 17c extra for postage. (Either friction foot pedal or steering post control is included.)

PRICE OF MOTORYCLE SIZE—$1.25 prepaid.

MONEY REFUNDED IN 30 DAYS IF UNSATISFACTORY.

BRAKE EFFICIENCY

Satisfaction often causes indifference. Brakes lined with RAYBESTOS lead many motorists to think that brake troubles never occur.

Then, when relining, they may neglect to *specify*

TRADE MARK **Raybestos** REG. U.S. PAT. OFF.

"THE ORIGINAL AND BEST ASBESTOS BRAKE LINING"

It's merely indifference bred of satisfaction —but nevertheless causing trouble.

To prolong satisfaction *demand* RAYBESTOS, the original heat-proof facing, made of finest long fibre asbestos. Oil, gasoline, water, heat do not affect the texture. Made as a unit, it wears as a unit and is practically indestructible.

Designed to grip—to act instantly—to give long service.

Raybestos Is Accident Insurance. "It Made The Automobile Safe." The name is stamped in every foot for your protection.

THE ROYAL EQUIPMENT COMPANY

Railroad & Bostwick Aves.
BRIDGEPORT, CONN.

We also make Duplex and Raymond Brakes and Gyrex the Mixer.

Digitized by Google

You Don't Have To See The *AMICO* To Know It's There!

Large Diameter Porcelain, has annular ridge affording protection to asbestos packing from explosion.

Vamped ridge—holds porcelain rigid at uniform pressure.

Asbestos packing set in taper seat—Perfect joint, no leakage, each explosion blows clean the exposed parts in cylinder. Construction allows porcelain to expand on incline.

The **SERVICE PLUG** WITH THE **LONG LIFE** **AMICO**

NON-LEAKABLE——UN-BREAKABLE

Absolutely the only plug made that will give guaranteed service. Try a set—if they are not as good as we claim, we refund your money cheerfully.

Order a set today from your jobber or dealer or order direct. We pay parcel postage. State size of thread.

Why don't you *own* the vulcanizer you're *paying for?*

Yes, actually paying for it in tire service that you might have—but don't get.

You know what happens when you let a casing cut gather dirt and water for a hundred miles. The fabric, that ought to be protected by the tread, rots, and you have a blow-out that ruins the tire.

Unless you have a vulcanizer, casing cuts will never get any attention. They don't look important enough to turn over to a garage for repair.

Result—you buy two tires where one would do as well.

SHALER Vulcanizer

If you'll fill the cuts and gashes in your tires with new, live Para rubber, and weld it in with a Shaler Vulcanizer, the tire will be as good as new until the tread is worn through. Why endure the trouble and danger and expense of blow-outs when there's this sure remedy? There is no satisfactory substitute for vulcanizing. No other method makes permanent repairs. All tube injuries are mended with the same vulcanizer.

You or your chauffeur can do the work in spare moments. No skill or experience necessary. Full directions and a supply of repair material accompany each machine.

Shaler Vulcanizers operate from your electric lighting circuit or with alcohol lamp. Prices, $2.00 and up.

Send This Coupon

today and receive a complimentary copy of "Care and Repair of Tires." It gives a remedy for every tire emergency. Write today.

The "Black Eagle" Spark Plug

PATENTED

50 Cents Is Enough

The "Black Eagle" Spark Plug has made good because it was designed and manufactured with this result in view.

A person in close touch with the supply and manufacturing ends of the trade was a visitor at our factory recently, and was shown the details of construction, including the machinery, testing, and assembling of the "BLACK EAGLE" Spark Plug. What he said we believe will be of interest to you, as it indicates the effort on our part to supply a high grade plug at a reasonable price. We therefore quote below his impressions.

"I am simply amazed at the workmanship, material, and construction of the 'BLACK EAGLE' Spark Plug. When I saw this plug advertised at a price of 50c to the consumer, I naturally supposed it was a cheap, common, plug such as you occasionally find in jobbing houses on the bargain counter. I am convinced, after seeing these plugs tested, and examining minutely the machine parts which enter into their construction, that **no better porcelain spark plug is offered by any one, regardless of the price they ask.**"

We are not **influenced** by what our competitors **charge for spark plugs!** We have **ignored price precedent,** for the reason that a **high grade spark plug** can be manufactured and sold at **50c each, and that is enough.**

Sent prepaid on receipt of price. Made in all standard threads.

The 8-DAY HIGH GRADE "BOSTON" AUTO CLOCKS

☞ These superbly built 8-day, high-grade clocks have seven-jeweled escapements, Breguet hairsprings, cut steel pinions, compensation balances, dust and water proof cases, etc., and are dealt in and used by those demanding a first-class article.

QUALITY and PRICE — UNAPPROACHABLE

Ask Your Dealer for the "BOSTON" AUTO CLOCK

MODEL B

MODEL C

Adjustable to various angles by Ratchet and Nut at back. In general appearance it closely matches many makes of speedometers.

MODEL D

MODEL E

PRICE LIST—PER CLOCK	SIZE (Dial)	MODELS A, B, C.	MODEL D	MODEL E
	3-inch	$18.00	$21.00	$24.00
	3 1-2-inch	20.00	24.00	27.00
	4-inch	22.00	27.00	30.00

For (Patent Applied for) Outside Stem Winding and Stem Setting Device, ADD $3.00 to above prices.

Superior to other devices. A great convenience for winding clock and setting the hands without opening the clock case.

☞ All sizes stated are the approximate diameters of the dials

Is Your Car Under Control At All Times?

YOUR BRAKES ALWAYS WILL INSURE YOUR SAFETY IF YOU INSIST UPON

TRADE MARK
Raybestos
REG. U.S. PAT. OFF.

"THE ORIGINAL AND BEST ASBESTOS BRAKE LINING"

RAYBESTOS grips with the slightest pressure. It transmits your message at once without slipping. When you want to stop, you do stop.

RAYBESTOS gives longer wear than any other brake lining because it is made better than others, and because it cannot burn up. The steepest hills produce no effect upon it. It is made of genuine long fibre asbestos, and the best raw material money can buy. It is treated by a secret process insuring highest efficiency. Essentially a product of QUALITY.

The name RAYBESTOS is stamped on every foot for your protection. There are inferior brake linings being "palmed off" on motorists who do not inquire into this important detail. Demand RAYBESTOS by name. It made the automobile safe.

COES

THE
Wrench Supreme

Strength without bulk or clumsiness.
Ease of handling without slipping or bruising.
Perfect balance and right grip

Everything the motorist desires in a wrench is to be found in the "COES" AUTOMOBILE MODEL, and you will never know perfect wrench service until you pin your faith to it.

It stands to reason that the 5 per cent. more you pay for a "COES" wrench goes for 60 per cent. more quality and service—put this wrench in the tool kit and shop. You will get your money's worth.

CONVENIENCE IN THE GARAGE

A Barrel of

Polarine

Ready to fill the handy Polarine can for your car. The easiest, cheapest way to use the best oil.

Polarine is the right oil for all motors. Polarine holds its body in the hottest cylinder—deposits little carbon—and puts an end to friction trouble.

Starts — Lights — Ignites

REMY

Six Volt System-Does-It-All

Your Car—And The Blacklist

IF the company which builds the electrical equipment on your car is not in business next season, or the following, how much will your car's value be diminished? If your car is equipped with Starting, Lighting and Ignition equipment, built in three different factories, how much greater is the risk?

This is something for both manufacturer and dealer to consider; It is a great big, vital question which must not be overlooked. Do you want to take chances on your car being blacklisted because of obsolete electrical equipment?

When you equip with Remy Starting, Lighting and Ignition you are making a 14 year old firm, the largest of its kind in the world, responsible for the satisfactory and complete electrical operation of your car; when you equip with Remy apparatus you are not taking chances.

Remy Reasons:

Each REMY starting system is accurately gauged to the size of the car motor. It produces enormous turning power.

Each REMY *slow speed* Protected Generator has its output regulated inherently. The battery is charged at a non-injurious rate.

More REMY magnetos are in use this season than all other makes combined. Their service is constant; their spark is hottest.

We manufacture this Starting, Igniting and Lighting apparatus in every combination, but the Remy Starting and Lighting Equipment is sold only to car manufacturers.

Write us about our Magneto Exchange offer.
Liberal allowance for any make of old equipment.

FORTY prominent German engineers, in an effort to find a weak spot, tore down an Overland that had run over 5000 miles. They could not find one single flaw on a single part.

Our exceptional value has always puzzled and astounded the world. But when you take into consideration the economy of building 40,000 cars a year you have the answer. The growing familiarity of 53 nations with the tremendous Overland construction methods has caused Overland sales to increase by leaps and bounds. The market for the best product is unlimited.

Our Exclusive Feature

We will (at small extra cost) furnish our Regular Models with the

AUSTIN

Two-Speed Axle

This axle provides two different gear ratios, both on direct drive, and in combination with a three-speed transmission gives six speeds forward and two reverse.

Model "77" has a Regular Direct Drive of 3 1-2 to 1, and a Special Direct Drive of 2 to 1.
Model "55" has a Regular Direct Drive of 4 1-2 to 1, and a Special Direct Drive of 3 to 1.

The Regular Direct Drive provides ample power and exceptional ease of control for hills, bad roads and crowded city traffic.

The Special Direct Drive for normal conditions, shows a gain of over 50% in mileage for the same fuel consumption and motor speed, eliminates the noise, wear and tear of running the motor at excessive speeds, adds materially to the life and durability of the car and pleasure of riding.

Model "77" Six Cylinders, 4 1-2 x 7 - - $6000.00
Model "66" Six Cylinders, 4 1-2 x 5 1-2 - - $5000.00
Model "55" Six Cylinders, 4 x 5 - - - $4000.00

MORE NEW, IMPROVED and **DISTINCTIVE FEATURES** than any other car. Two-speed rear axle, high pressure air self-starting system, complete electric lighting system, left hand steer, center control, two-spark magneto, four-speed transmission, both brakes controlled by foot pedals.

Write for complete description and any information you may desire in regard to our two-speed axle.

Greatest hauling achievement on record —performed by these four KisselKar Trucks

SEVERAL makes of motor trucks were employed in hauling material for the construction of the Big Meadows dam in the California Sierras—the biggest contract of its kind ever undertaken in America. Most of the trucks made sorry work of the task and none were ever able to equal the weekly tonnage carried by the KisselKars. Over trails of decomposed lava, up and down the steepest and most dangerous grades, these three-ton KisselKars plodded continuously for forty days and nights, averaging in daily delivery 80,000 pounds of cement.

This truly marvelous feat proves anew the sturdy and sterling nature of KisselKar construction. A powerful truck, with plenty of reserve strength—able to meet exacting emergencies as well as expected stress.

KISSELKAR TRUCKS

1500 lbs., 1, 1¼, 2, 3, 4 and 5 tons

A truck to be right must be built of the best and most thoroughly tested materials, put together by skilled workmen under authoritative supervision—tested under the most rigid system. It must have four speed transmission—a lock on the differential to pull a stuck or slipping wheel out of its difficulty—a power plant of tried and unquestioned ability—general construction that will resist vibration. *In brief it must be like the KisselKar.*

***KISSELKAR SERVICE** insures prompt and careful attention to truck owners, because it offers a specific policy, ample and accessible facilities and skilled mechanics. KisselKar Service Buildings are at all principal points, while the system reaches the most remote agency.*

Send for Truck Portfolio with hundreds of illustrations of KisselKar Trucks in actual use.

Cartercars make good— So do Cartercar agents

To build up a successful business the motor car agent must have a car that will back up every statement he makes—that goes out and builds for him a reputation as a dealer in "good" cars. This is just the reason why the Cartercar has perhaps a larger percentage of unchanged agencies than any other car on the market today.

Cartercar With the Gearless Transmission

The Cartercar has the simplest possible form of transmission—only two unit parts. That would please your customers.

This transmission enables the car to climb 50% grades and run through bad sand and mud with perfect ease. Every buyer wants this service, but cannot get it in a gear car.

Then, too, the Cartercar has an unlimited number of speeds—all controlled noiselessly and easily with a single lever. Would this appeal to the buyers whose wives and daughters drive?

Another important feature, the Cartercar does not jerk or jar in starting and changing speeds. This means the utmost comfort and besides about half of the wear on tires is prevented. Would your customers object to paying only half as much for tires as the driver of the gear car?

And the Cartercar is equipped with one of the very best electric starting and lighting systems in use today. The "Jesco" starter, with both lights and cranking controlled by a single knob at the driver's left.

There are four splendid models—each one a leader in its class. These are cars that you can sell—that you can build up a permanent business with. If we are not represented in your territory write us.

No-Rim-Cut Tires 10% Oversize

11% Less This Year

No-Rim-Cut tires—now the favorite tires—cost 11 per cent less this year.

That's a new saving. They have always saved rim-cutting, saved overloading. Now their very popularity is saving you an extra 11 per cent.

How It Happens

We have lower rubber this year, but higher fabric and higher cost of labor.

Some makers say the net saving here warrants no reduction. Some say five per cent.

But we, in addition, have a multiplied output. A factory capacity now pretty close to 8000 motor tires daily. We have new factories with the latest equipment.

So No-Rim-Cut tires will cost, we figure, 11 per cent less than last year. And since April 1st we have given that saving to the users of these tires.

Our Profit

Our policy is to keep our profit around 8½ per cent. So long as we do that no maker in the world can sell an equal tire for less.

To assure you of this, every year we advertise our profits. We want you to know that in Goodyear tires you get the squarest sort of deal.

No Extra Price

In No-Rim-Cut tires you are getting tires which never can be rim-cut. That wipe out completely a trouble which ruins 23 per cent of old-type tires.

You are getting tires 10 per cent larger than clincher tires of the same rated size. And that adds, on the average, 25 per cent to the mileage.

And you are getting now 11 per cent reduction. So these new-type tires, with all their advantages, cost no more than standard old-type tires.

Consider those savings and judge for yourself if it pays to insist on these tires.

Hundreds of thousands think so. And they have bought, in the past 12 months, over a million Goodyear tires.

SIX YEARS AHEAD

Electric automobile lighting in 1907!

THE APLCO SYSTEM

was the first to be installed; always the best

In 1907 Mr. Vincent G. Apple installed an electric lighting system on the Franklin car shown above. It was the first electric-lighted automobile; it is still doing service on the streets of Dayton. Apple equipped cars were exhibited at shows years ago.

WHEN you start out to equip your car with a lighting outfit you'll find that with most of the systems offered you must adapt your requirements, your convenience and the appearance of your car to the necessities of the system—or do without it.

The Aplco system is the other way; made to conform to *your* requirements. One of our dynamos will adapt itself as perfectly to the construction of your car as if built especially for it.

Within everyone's price

The Aplco System is the best for your car; its quality is of the highest required for high-priced cars; its price is in proportion to the cost of any low-priced car.

Please send to us for detailed information of how your car can be put a year ahead with the Aplco System, and learn the name of our nearest service station.

Passing Cars

By R. E. Olds, Designer

Cars with right-side drive are passing. Note that all the best new cars have the left-side drive.

Skimpy tires are passing. Men are demanding an over-size tire to cut down cost of upkeep.

Projecting lamps are passing. All the best cars have set-in electric dash lights.

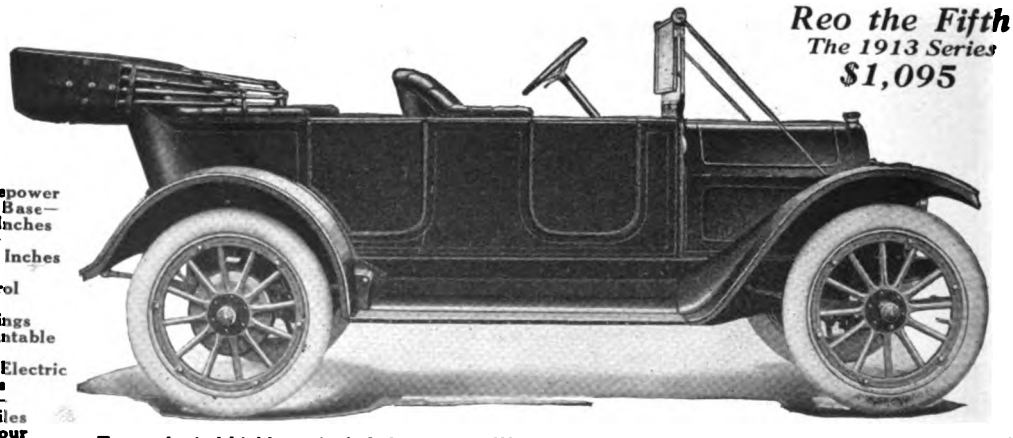
Levers to block the driver's entrance, on either side, are passing. In future cars, as in Reo the Fifth, the driver's way will be clear.

Cheaply-built cars are passing. They cost too much for upkeep.

In Reo the Fifth we use 15 roller bearings. We use 190 drop forgings.

We give to each driving part 50 per cent over-capacity.

We use steel made to formula, analyzed twice. Gears and springs are given radical tests. We use a $75 magneto, a doubly-heated carburetor, a smokeless oiling system.



We are building a car to bring your upkeep down to the lowest minimum. A car to run in five years just as well as new.

The demand for such cars is growing each year faster than we can supply it.

Write for our catalog and address of nearest showroom.

MERCER

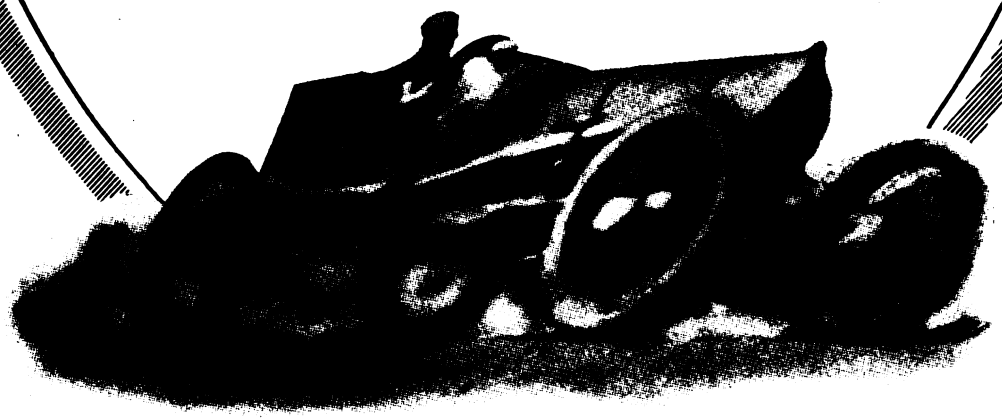
WINS SECOND PLACE IN 500-MILE INTERNATIONAL SWEEPSTAKES

Time—6 hrs. 45 min. 6 sec.
Average Speed—75 miles per hour.

A 300 cubic inch Mercer cemented its right to recognition as America's premier medium-weight automobile, when it finished second in the world-famous 500-mile race at Indianapolis, May 30.

The only car to make a better showing was the French Peugeot, half again as large as the Mercer, and considered as the world's most wonderful speed creation.

Mercer design, Mercer construction and Mercer quality are always ready to be pitted against the best that other manufacturers can offer. And in the hardest and longest contests where durability and consistency count, the Mercer shows up best. This should have much significance to the prospective motor car buyer.



MERCER, WITH ITS PRONOUNCED SUPERIORITIES IS SOLD IN FOUR DIFFERENT MODELS

Prices—$2600 to $2900

Descriptive literature sent on request.

"Our Tires Stood Up."

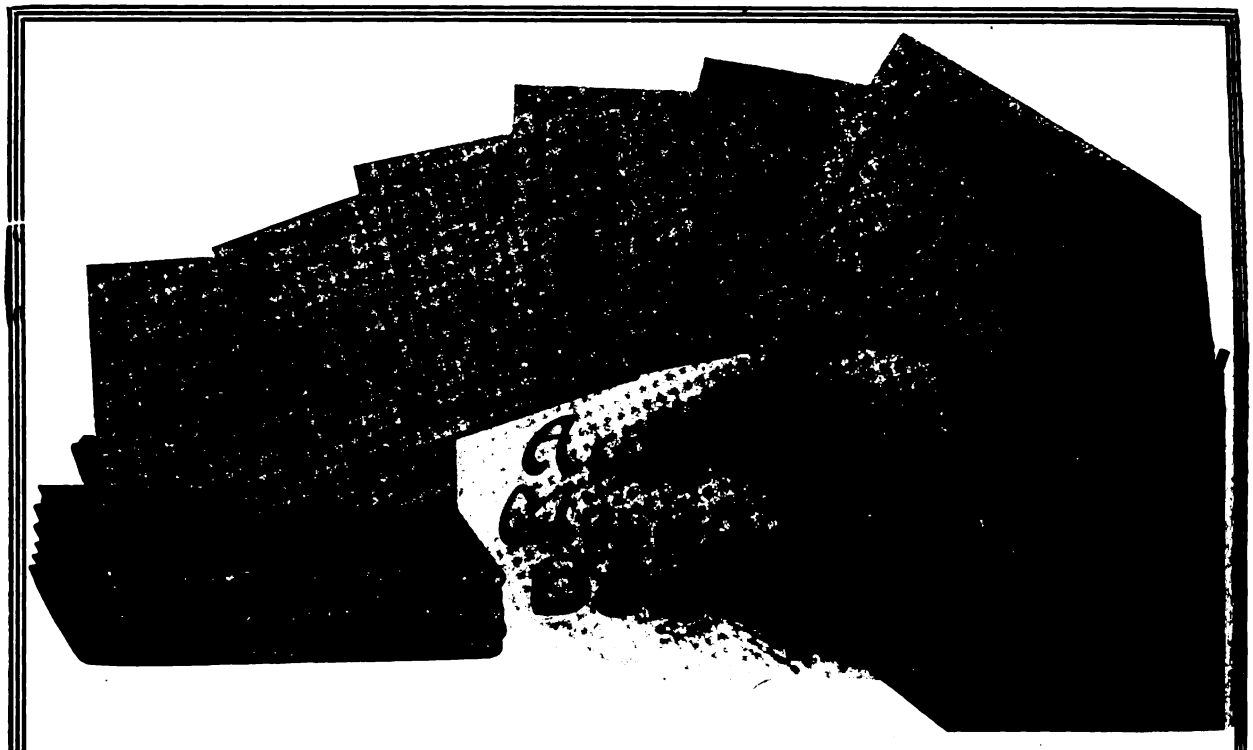
At the end of a long journey, arrival on time depends—nine times out of ten—on tires.

The more times you can say "Our tires stood up" the greater your satisfaction in motoring—the less your expense for tires.

For this reason Walpole Tires should be your choice because they have extra thick side walls and extra tough tread, which protect the fabric against stone bruise, preventing blow-outs that are the most fertile source of tire damage.

Walpole "NO STONE BRUISE" Tires

are specially constructed for hard touring wear. Their extra toughness stands more real wear than it would seem any rubber could stand.



Let us put **Walpole** facts and figures before you. Any **Walpole** dealer has the proof, or write to us.

Walpole Tire & Rubber Co.

General Offices: Walpole, Mass.

Factories at Walpole and Foxboro, Mass. and Granby, Can.

10 Books 800 Pages of Text 1500 Illustrations

Automobile Owners **Automobile Repairmen** **Students**
Automobile Drivers **Automobile Dealers** **Engineers**

Each book has been thoroughly revised and its contents have been brought right up to the minute. The subjects have been treated in a simple, non-technical manner, making the discussions as valuable to the novice as the engineer. Eighty per cent. of the automobile and technical schools in the United States and Canada use these works as text books, and more than 500,000 copies are sold annually. No similar expositions are to be compared with them—regardless of price. Every car owner and operator should have the full set.

Knowledge of your car means additional pleasure in its use and decreased cost in operation and maintenance. The practical instruction that you need is to be found in these books, and to acquire the same fund of information in any other manner would require years of constant study. You must understand your motor if you would adjust or repair it. The subject is fully treated in the Engine book. This applies as well to the Magneto, Carburetor, Battery, Lighting, Chassis and Tire books. When overhauling and rebuilding, read that discussion. The book on Motor Car Operation covers that subject with reference to all cars. No matter what the need, there is a book to meet it. No car or component is neglected, and all standard engines, magnetos, carburetors, batteries, lighting systems and vehicles are dealt with. The full set includes:

Engine	$ .35	Motor Car Tires	$ .25	Magneto	$ .35
Carburetor	.35	The Motor Car Chassis	.25	Motor Car Operation	.50
Lighting by Electricity	.50	Motorcycle Construction, Care and Repair	.35	Overhauling, Rebuilding and Repairing	.50
Battery	.35

A Big Money Maker For the Garage

Vulcanizing pays big profits. Unless you're equipped to handle it, you are missing one of the most valuable opportunities connected with the automobile trade.

No experience is necessary. We teach you all you need to know in order to turn out tire repairs that you can guarantee.

Give your customers complete service. Don't force them to take their tire work to your competitor.

SHALER Vulcanizing Plant

Will do every kind of vulcanizing that you will want to handle—tube punctures to casing blow-outs. Handles six tubes as quickly as one. Casings are repaired by the approved wrapped tread process adopted by tire manufacturers.

Steam is raised in twenty minutes in a copper coil boiler, so that the machine can profitably be heated up for a single repair. A gallon of gasoline will run the outfit all day long, or gas may be used for fuel.

The temperature control is automatic. No watching or regulating. Simply start the burner and a thermostat keeps the temperature exactly right for vulcanizing.

Other vulcanizers for every requirement

There's a Shaler for every requirement of motorist and garage, from the $2.00 Vul-Kit for mending tube punctures on the road, to the complete garage plant shown. Electric, steam, and alcohol heated models.

Garages:

Write today for details of this money-making proposition. Get busy before *your* trade is started into some one else's door.

C. A. SHALER CO., 956 Fourth Street Waupun, Wis.

This is an Old Story to White Owners

THEY know that long ago White foresight protected their car investment from undue depreciation, the result of obsolete design. Because WHITE Cars were the first to possess *all* the fundamental features of advanced construction, such as:

LEFT SIDE DRIVE *RIGHT HAND CONTROL*
ELECTRICAL STARTING AND LIGHTING
ECONOMICAL LONG STROKE, SMALL BORE MOTOR
FOUR SPEED SELECTIVE TRANSMISSION
MONOBLOC CYLINDERS *POWER AIR PUMP*
SINGLE IGNITION *CONCEALED DOOR FITTINGS*

White owners have their investment secured for years to come.

Those who do not own White Cars Should know that to purchase a car that does *not* have every one of these important features is to own a car that is *already practically obsolete.*

THE WHITE COMPANY
CLEVELAND

THE AUTOMOBILE JOURNAL

VOL. XXXV, No. 9 JUNE 10, 1913 Price, $1.00 the Year

BRITISH-AMERICAN ENGINEERS' MEETING.

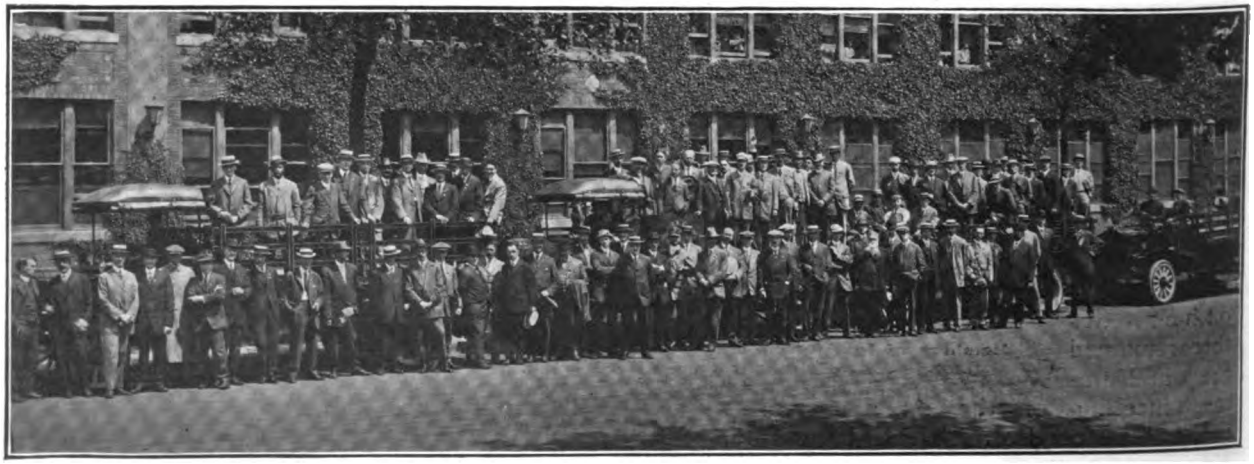
Joint Convention of Representative Bodies in the Two Countries Proves an Important Event in History of the Industry—Visitors Include Men Well Known on Both Sides of the Atlantic—The Tour of Inspection.

"YOU are the most hospitable nation in the world," declared President T. B. Browne of the Institute of Automobile Engineers of Great Britain at the banquet tendered the members of that organization now in this country by the Society of Automobile Engineers in Detroit, the evening of June 3. But although the visitors had been entertained in various cities since May 26 and were to visit still other cities there remained the midsummer meeting of the American society on board ship from Detroit to Sault Ste. Marie and Mackinac island. There were some 600 engineers in the party, and upon its return to Detroit Saturday afternoon the last vestige of doubt as to American hospitality had been dispelled.

Members of Institute of Automobile Engineers of Great Britain at Automobile Club of America Soon After Their Arrival in This Country.

In many respects this has been one of the most notable incidents in the history of the automobile industry. It has afforded opportunity for an exchange of opinions and business methods. It is unfortunate that space does not permit the presentation of a detailed report of the trip and the meeting. Much that will prove of lasting benefit to the industry both in America and Great Britain has transpired during the past two weeks.

Digitized by Google



Representatives of the American and British Engineers During Their Visit to the Factory of the Ford Motor Company in Detroit.

The British party is composed of men long identified with the production of automobiles and their accessories. Perhaps the best known among among them is the venerable J. B. Dunlop, who invented the pneumatic tire in 1887, now in his 74th year. T. B. Browne, president of the English society, is one of the pioneers in Great Britain, having been an active participant in the first 1000-mile test given an old single-cylinder horizontal engine in 1900. Secretary Basil H. Joy is almost as well known in America as many of the American engineers. Charles Wheeler is engineer for the postal department in London. E. B. Wood has devoted much time to researches in combustion, which have been followed with much interest by American carburetor manufacturers. Thomas Clarkson and C. Gilbert Moore represent the Society of Motor Manufacturers & Traders, an organization corresponding in many respects to the Automobile Chamber of Commerce in this country. The other men are quite as well known in their respective fields.

The party arrived in New York May 26, where its members were greeted by President Howard Marmon, Secretary Coker F. Clarkson and the other members of the American committee of arrangements, Chairman Arthur B. Cumner, Robert McA. Lloyd and Alden L. McMurtry. That evening the visitors were entertained at a beefsteak dinner at which Joseph Anglada presided as toastmaster.

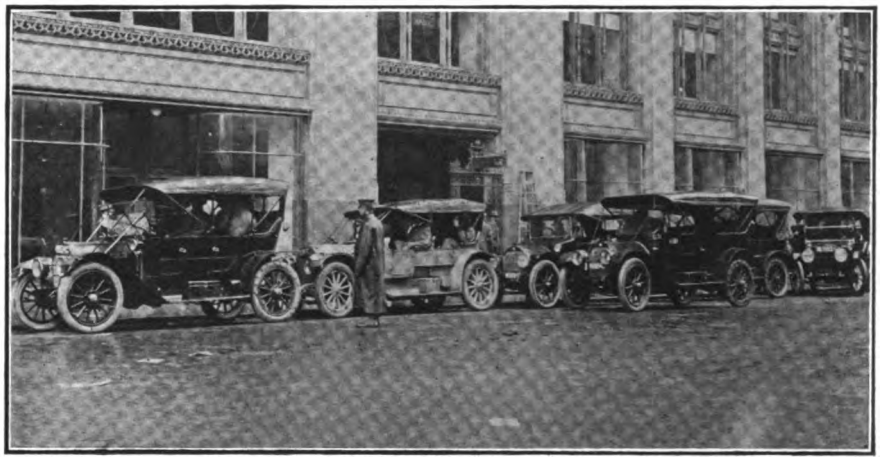
After a day of sight-seeing in New York the second evening was spent at the regular monthly meeting of the Metropolitan Section, S. A. E., the subject being "Motor Starters." This had been selected as one which should make a special appeal to the visitors, since the motor starter has not made the same progress in Great Britain that it has enjoyed in this country. Several manufacturers placed at the disposal of the meeting sample installations and equipment and full opportunity was afforded to study the subject from every angle.

Wednesday the party left for Pittsburg, Penn., where the Carnegie-Homestead steel mills and the works of the National Tube Company in McKeesport were visited. Memorial Day the Englishmen were guests of the Indianapolis motor speedway management at the 500-mile race, and the next day the plants of the Prest-O-Lite Com-

Members of the Institute of Automobile Engineers of Great Britain and the American Society of Automobile Engineers at the Packard Plant in Detroit.

Digitized by Google

pany and Wheeler & Schebler were inspected.



Detroit was reached Sunday morning. Monday morning was spent at the Ford factory, where cars were assembled in less than two hours. President Browne was invited to mark certain cylinder castings, etc., in the big piles and watch the progress of the work. Later, shortly after the party had finished its inspection of the plant, a car appeared in front of the office and Mr. Browne was asked to take a short ride. Upon his return to the office, the hood was lifted and his marks were disclosed to him. The next surprise came when George W. Houk, of the George W. Houk Company, Philadelphia, distributor for Rudge-Whitworth wire wheels in America, presented Secretary Joy of the English engineers with a touring car, the assembling of which he had just been witnessing. The presentation speech was made by Henry Souther, a past president of the American society. Mr. Houk resided in England for 14 years and came to know Mr. Joy very intimately. The gift was made in token of this friendship.

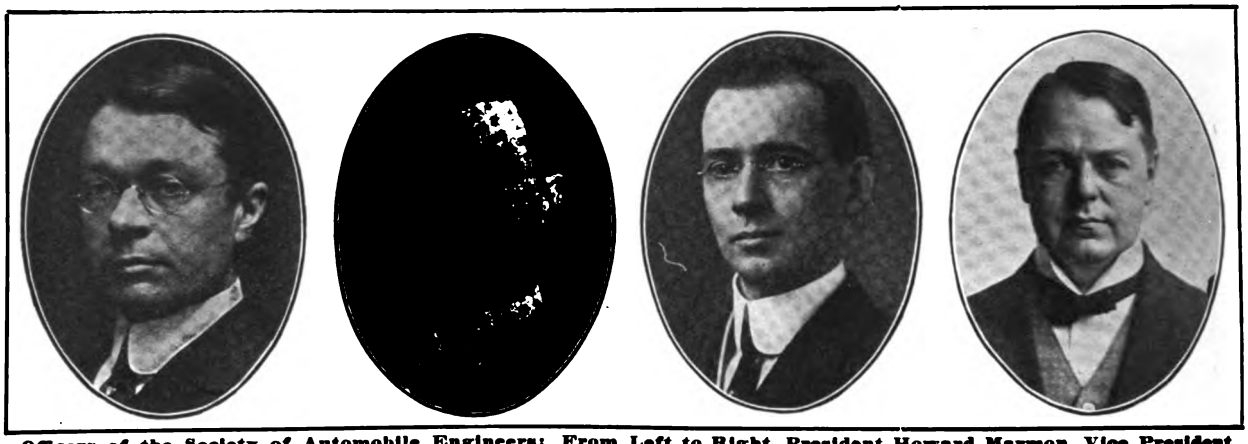
The entire afternoon was spent at the factory of the Cadillac Motor Car Company, where President H. M. Leland of the company explained the working of many machines which were entirely new to the British engineers. A particularly fitting compliment to the guests was the serving of afternoon tea, just before entering the testing department.

Tuesday morning was reserved for an inspection of the Packard plant, and the afternoon for the Timken axle factory. At the former luncheon was served with President H. B. Joy acting as host. In the evening the official banquet of the S. A. E. to the I. A. E. was held in the Hotel Pontchartrain. Howard Coffin, past president of the American society, who filled that position during the trip of the American engineers to Great Britain and the Continent in 1911, acted as toastmaster.

The freedom of the city was extended by Mayor Marx, after which President Marmon welcomed the guests on behalf of the S. A. E. President Browne responded for the I. A. E., in a fitting manner, recounting many of the pleasant features of the previous week and anticipating the additional pleasure to be gained by more intimate association with the American engineers at the forthcoming meeting. T. C. Pullinger of Scotland spoke concerning the matter of factory production, representing in a measure the British manufacturers, while H. M. Leland of the Cadillac company acted in a similar capacity for the American makers.

The next morning the plants of the Hudson Motor Car Company and the Continental Motor Manufacturing Company were inspected and in the afternoon the entire party embarked for the midsummer meeting on Lake Huron. Several papers were read, both by American and British engineers, some of which are presented herein, and others of which will be published in the near future. Besides the reports of committees and other routine business, plenty of time was found for social activities during the trip.

British Guests of the Metropolitan Section, S. A. E., Leaving Their Hotel for a Sight-Seeing Tour of New York City.



FACTORS TO BE CONSIDERED WITH PNEUMATIC TIRES.

(Extract from a paper read by Paul W. Litchfield at midsummer meeting of the Society of Automobile Engineers.)

The manufacture of pneumatic tires, an industry less than 25 years old, has grown until at the present time the value of its product in the United States alone amounts to about $150,000,000 annually. It has been the practise of automobile and vehicle builders for many years to make as nearly as possible the entire vehicle, but while the pneumatic tire is a component part of every vehicle, no manufacturer of bicycles, motorcycles or automobiles has ever successfully made his own tires, and the number of tire manufacturers has always been relatively very small compared with the volume of the industry.

About 1890 the safety bicycle and rubber tire were developed. This brought to the attention of everyone the simplicity, speed and healthful exercise to be obtained by abandoning the horse and propelling the vehicle by

Officers of the Society of Automobile Engineers: From Left to Right, President Howard Marmon, Vice President J. G. Perrin, Vice President Russell Huff, Secretary and General Manager Coker F. Clarkson.

man power. While the horse could not call attention to the weaknesses of the vehicle which made his work harder and his progress slower, man, when he assumed the duties of the horse, began to analyze. Then began the study and development of the self-propelled vehicle industry of today. The development of the internal combustion motor and of the pneumatic tire to protect the delicate machinery from shock followed by various stages. Automobile engineers have been following largely the development of the machine, while the tire man has followed the development of the tire as a means of protecting the machine. While today the cost of rubber tire upkeep is one of the largest items of expense in the maintenance of a car, it must not be forgotten that it is the tire which is put where most of the abuse comes, which does for the car what the steel rail does for the locomotive and makes every road possible.

In a self-propelled vehicle, what are the functions of the tire? They are, first, and foremost, a cushion to protect all parts of the vehicle from the shock caused by the impact against inequalities of the road; second, to provide proper traction, avoiding unnecessary slip. These are the two main functions, and, therefore, the principal thing to be kept in mind in tire design is to satisfactorily accomplish them at as low a cost a vehicle-mile as possible, with the least possible consumption of power, and with the least amount of trouble and inconvenience to the driver and occupants. The pneumatic tire depends upon the elasticity or resiliency of a gas (i. e., air,) for its cushioning effect, while the solid tire depends upon the resiliency of a practically incompressible solid (i. e., vulcanized rubber). It is needless to say that air is the more perfect cushion and the lighter and cheaper, the cost lying only in the air container. No other solid body can compete with india rubber in acting as a cushion by being greatly distorted and recovering its original shape again repeatedly with very little fatigue.

One point regarding rubber must be carefully borne in mind, which is, that vulcanized rubber is practically incompressible; its cushioning effect is only possible by distortion and recovery, and it must be allowed by the designer plenty of room for this action. A glance at hundreds of patents on solid rubber tires shows that this point has been almost entirely ignored by inventors. Another point frequently overlooked is that the shock may come from almost any direction, owing to varying road surfaces, turning corners, running into curbstones, etc. Many tires and spring wheels carefully designed to take up blows acting directly from the ground vertically towards the rim are utterly unfit to withstand shocks in other directions.

Before selecting between the solid and pneumatic tire the weight to be carried, the speed to be attained, and the character of the road must be considered. The load to be carried can be worked out satisfactorily on either type. In a solid tire it requires a sufficient amount of properly compounded rubber, and in a pneumatic a sufficient combination of air volume and pressure contained in a suitable retainer. The character of the road and the speed have a great deal to do with the selection of type, as air being a much better cushion than rubber, allows the pneumatic to give much more efficient cushion and traction on rough roads and at higher speeds than is possible for the solid. As far as the efficiency of the vehicle is concerned the pneumatic would nearly always be chosen as the ideal tire were it not for the fact that in many cases the roads are sufficiently good and the necessary speed sufficiently slow to make the saving in cost a mile on solid tires, due to their longer life, offset the increased efficiency of the pneumatic. Again, the unreliability of the pneumatic due to injury through punctures or blowouts, making attention to it necessary at awkward places and times, often causes the selection of solid tires, as frequently occurs on pleasure electrics for ladies, fire apparatus, mail wagons, etc. In short, good roads and slow speeds are favorable conditions for solid tires; ordinary roads and high speeds for pneumatic tires. The solid tire having less cushion and less motion requires a lower percentage of pure rubber in its

Officers of the Institute of Automobile Engineers: From Left to Right, President T. B. Browne, Councillor T. C. Pullinger, Councillor Charles Wheeler, Secretary Basil H. Joy.

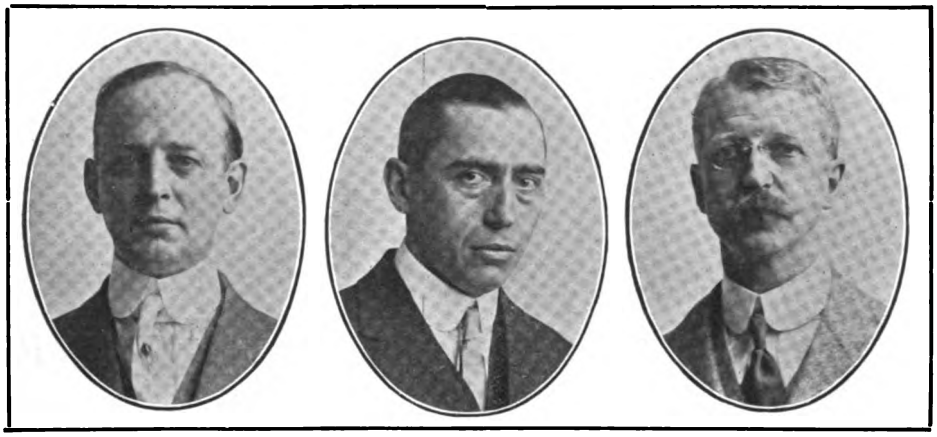
Digitized by Google

composition than the pneumatic, which tends to lower tire mileage cost.

Rubber Supply.

A lowering of the price of crude rubber will tend to popularize the pneumatic tire, and it is well to bear this point in mind, as the average price of crude rubber will probably be lower each year until it reaches less than one-half its present market price. The selling price of crude rubber in the past has been fixed by supply and demand and speculation, with no reference to its cost of production, but its cultivation on a large scale is changing this condition, and it is probable that in five or six years there will be a sufficient amount of rubber to supply the demand at a cost of less than 40 cents per pound, which alone should save 33 1-3 per cent. in the cost of pneumatic tires. The danger of the rubber supply running out, which was very serious three years ago, causing rubber to advance to $3 a pound, caused successful cultivation to become an accomplished fact, which apparently solves the question of our future supply. It is hoped that the present scarcity and high price of gasoline will in a similar manner be the means of solving the question of the future motor fuel supply.

Vulcanization.



I would now like to discuss some of the differences between the principal pneumatic tires now in the market. Let us first take up the subject of vulcanization.

Vulcanization is the chemical change which is caused by the action of heat and time upon the mixture of rubber and its chemical compounding ingredients, transforming it from a plastic dough to a resilient and reacting solid. In order to get a properly vulcanized tire extreme care must be used as to the materials used in compounding, in regard to both quality and amount, and also as to time, temperature and conditions under which the vulcanization takes place. A tire revolving constantly along the road, carrying the weight of the car, and each moment changing its shape and recovering, generates a great deal of heat. This action of heat carried on for a considerable time has a tendency toward affecting the vulcanization. Therefore, all high grade guaranteed tires are usually compounded so that they take a very long time to vulcanize. This increases the cost of manufacture. Many unguaranteed tires are so compounded that they vulcanize quickly, saving from one-half to three-quarters of this time, in order to cut down the cost, but the heat generated along the road tends to overvulcanize these tires and they are apt to separate and blow out after a much shorter mileage on this account.

The three methods of vulcanizing now in use among the tire manufacturers are popularly known as: First, the one-cure wrapped tread, as examples of which may be mentioned the Fisk, Empire, Ajax and the G. & J.; second, the unit molded type, examples of which are the Republic, Goodrich, Michelin and Diamond; third, the two-cure wrapped tread, examples of which are the Firestone, Morgan & Wright and the Goodyear. Michelin and Diamond tires were formerly made by the third process, but recently have been made by the second. In the one-cure wrapped tread process the tire is completely built over an iron core, wrapped with fabric and put into an open steam boiler and vulcanized in one heat. In the unit molded process the tire is completely built upon an iron core, then put in an iron mold and vulcanized under hydraulic pressure in a press or open steam vulcanizer. In the two-cure wrapped tread process the carcass of the tire is built over an iron core and vulcanized in a mold, the same as in the unit molded type, but not entirely cured. It is then removed from the mold, buffed and cemented and the tread rubber applied and given a second vulcanization. With the Morgan & Wright and Firestone tires this second vulcanization is done while the tire still remains on the core, while in the Goodyear process the tire is inflated by means of an air bag on the rim; in either case after the tire has been cross wrapped the second cure takes place in an open steam vulcanizer. Each of these three methods of vulcanization has its enthusiastic supporters. Those who use the first two methods claim that they obtain a more perfect vulcanization. They are undoubtedly cheaper in first cost. Those manufacturers using the two-cure process believe that the vulcanization is more uniform throughout the tire and that there is sufficient increase in quality and durability of the tire produced to warrant the extra initial cost.

Fabric.

Another difference in pneumatic tires is in the style of fabric used, there being two distinct types upon the market, the close-woven fabric tire and the cord tire. Nearly all tires are of the close-woven fabric type as they are more durable, easier to repair in case of injury and can be operated at a much lower cost a mile. In driving a car considerable power is consumed by the flexing of the pneumatic tires, and it has been found that this loss can be reduced largely by using parallel cords instead of woven fabric, as much as 25 per cent. of the power sometimes being saved. The cord construction also permits greater speed and makes an easier riding tire than the square woven type. It is, however, a much more difficult tire to repair and in practise does not work out at as economical a cost a mile as the close-woven type. Its power-saving factor makes it desirable on electric vehicles, where the radius of action is limited by the capacity of the storage battery used. In a fuel economy test with a gasoline car the mileage in many cases could be increased from 15 per cent. to 20 per cent. by substituting cord tires for the square woven-fabric tires.

Members of American Committee of Arrangements: Left to Right, A. B. Cumner, Chairman; Allen L. McMurtry and Robert McA. Lloyd.

Size.

The next point to consider is the size of the tire. In the pneumatic tire the load is carried by an air cushion, and the amount of the load carried depends upon the combination of the volume and pressure of air used. For a given weight of car it follows, therefore, that the larger the volume of air in the tires the less inflation pressure required, while the smaller the tire the greater the inflation pressure necessary to carry the load.

Tires should be large enough to carry the load with very little flattening of the tire, say not over 14 per cent. of the sectional diameter at an inflation pressure which will give sufficient cushion to the vehicle. For instance, a car may be equipped with 32x3.5-inch tires and be of such a weight that it requires 90 pounds pressure in them to properly carry the load and avoid such excessive flexing of the tire walls as to cause rapid breaking down of the casing. This pressure would make the tire so rigid that the tendency would be to reduce the air pressure in order to get sufficient cushion, which would cause the tire to give short mileage. While, if a 33xfour-inch tire were used on this car, the air volume would be enough larger to permit the successful use of a lower air pressure, increasing both the cushion and the durability of the casing.

The inflation pressure which you see embossed on

Digitized by Google

the casings are the pressures which the tire manufacturers recommend as necessary when carrying the maximum load for which the tire is guaranteed. There is always a certain amount of leaking of the air through either the pores of the rubber or through the valve connections, which causes the inflation pressure in the tire to be greatly reduced. It is frequently the case that a 32x3.5-inch tire will start out with 70 pounds air pressure and not be reinflated until the pressure is down to less than half this amount. Needless to say, the volume of air being constant, the ability of the tire to properly carry the load is reduced constantly as the pressure decreases. This shows the necessity of frequently testing the pressure with a gauge and keeping the tire up to the required pressure.

Whatever effort the tire manufacturer makes to put mileage into a tire is of no value unless the air pressure is maintained by the user. The extra power consumed by the use of the larger tire is so small as to be a negligible quantity in present day cars. It is also to be noted that the larger the cross section of the casing the greater the amount of tire wall which comes into action, which reduces the fatigue of the rubber and fabric and lengthens the mileage which the casing will give.

Fillers.

The use of tire fillers is another question which has commanded the attention of automobilists, owing to the extensive advertising carried on by tire filler companies during the past year. A pneumatic tire casing is designed for use with compressed air; when it receives a blow or shock from an obstruction in the road, the blow is distributed all over the casing, owing to the support of the perfectly fluid air cushion behind it, the tire absorbing the blow, turning it aside, with very little injury to the casing, except in very severe instances. When a filler is used the blow is localized in the immediate proximity of the point at which it is received, and the strain falls in one place, thereby weakening the tire. Constant repetition of these blows causes the casing to gradually disintegrate and wear out. The fillers add considerably to the weight of the car, require a great deal more power to drive the car, and do not absorb the shocks to nearly the same extent as is the case of air. Air retains its resiliency and is as perfect after being in use a year as when put originally into the tire, whereas the original maximum resiliency of a tire filler decreases gradually. The detrimental effect of the fillers was shown by the withdrawal of the tire guarantees as well as car guarantees by nearly all the principal manufacturers when tire fillers are used.

Another disadvantage of the filler is that as the casing stretches the filler, being a solid body, does not follow up the casing with a constant pressure, whereas air, being a gas, maintains its pressure continually, regardless of the flexing and stretching of the casing. The casing cannot carry the load for any considerable period without the required pressure in the case of a tire filler any more than it can with air. Substitutes for air other than solids have been used, especially different forms of gas. The use of these various gases as proper means of inflation has been questioned by the tire manufacturers, not because they are chemically injurious to the rubber, but because they filter through the walls of the inner tube much more rapidly than air, consequently reducing the inflation pressure.

Carbonic acid gas at usual riding temperature will leak through the walls of the inner tube many times faster than air. It has even been demonstrated that with air, the oxygen seeps out much faster than the nitrogen. The disadvantage of the carbonic-acid-gas-inflated tire is that the user does not realize how fast the pressure is reduced and does not restore it quickly enough. When sufficient care is used and the inflation pressure is frequently tested, there is no reason why carbonic acid gas should not be as satisfactory as air.

Rims.

Before closing I would like to touch upon the subject of rims for pneumatic tires, as it is of the greatest importance to the tire that it be fixed upon a properly designed rim. With clincher tires especially the exact contour of the hooks is of great importance, as it takes only a very litle variation from the standard to completely ruin the tire. The proper design for the width between clinches on a clincher tire has been standardized at 60 per cent. of the nominal cross section of the tire. It is the writer's opinion that the proper dimension for the width at the heel of the bead for the straight-side wired-on tire is 66 2-3 per cent. of the nominal cross-section of the tire, flaring outward from the heel of the bead. The less the required flexing of the casing when the tire is overloaded or insufficiently inflated, and the larger the supporting surface given by the rim to the tire where the flexing occurs, the less the tendency toward rim-cutting. The ideal rim would give continuous support to the tire, especially where the tire leaves the rim on the sides. Split and open side rings should be avoided as far as possible. When split rims are used it is also absolutely necessary that they be in perfect alignment.

CALCULATING DEPRECIATION OF COMMERCIAL MOTORS.

(Paper read by Charles Wheeler, member of the council, Institute of Automobile Engineers, Great Britain, at midsummer meeting of the Society of Automobile Engineers.)

Depreciation has been defined as the diminution which takes place in the value of a wasting asset in spite of the amount expended on it in repairs, and there is no doubt that in assessing the diminution in value of commercial vehicles something more than the application of definite accountancy principles is necessary. This is probably true as applied to all factory accounting, which in effect is dissection as opposed to combination, the usual operation of commercial accounting.

If exception be taken to this short paper on the ground that the subject treated is more of a commercial than of an engineering character, I would point out that the scientific keeping of accounts connected with automobile production and the running of automobiles is of vast importance, and necessitates expert engineering advice in nearly all departments. In fact, the engineering head must not only know what cost he is "up against" on the score of depreciation, but he must have a big voice in the determination of the governing factors.

The first factor to be considered is the estimated "working-life" of the automobile, and this depends very largely on the particular circumstances in which the vehicle is used. Thus a Maudslay motor 'bus runs some 700 miles a week, while a Maudslay stores van averages say 140 miles a week. Obviously, other things being equal, the length of the "working-life" must be considerably in favor of the stores van. The "working-life" also depends upon the quality of the vehicle, i. e., quality in design and manufacture, and is thus closely connected with the initial cost. The "working-life" further depends upon the condition in which the vehicle is maintained, and this in turn depends upon the driving and supervision, and the amount spent on renewals.

Having decided upon an estimated "working-life" L, the next step is to consider by what method the initial cost should be spread over the period decided upon—in other words how the depreciation should be written off year by year. Three methods at least warrant consideration, namely:

1. To divide the capital outlay C by the number of years at which the "working-life" L is estimated and charge the quotient against each year's working costs.

2. In the first year to write off a high percentage of the cost; in the second and succeeding years to write off the same percentage on the diminished value, that is, the balance left after deducting the previous year's depreciation.

3. To divide the capital outlay C, less residual value, R, (that is, the estimated value of the vehicle at the end of its "working-life") by the number of years, etc.

In each method, renewals and repairs, as they occur, are charged against "general running expenses." The first method cannot of course be recommended where any degree of accuracy is required. The second method is perhaps financially the soundest if it be desired to ascertain from one's books the actual realizable value of the vehicle at any moment. Although this method gives a fairly true result in the end, it has the objection that in its earlier years the cost of the service is overloaded.

The third method, expressed by the formula $\frac{C-R}{L}$, where C = capital outlay, R = residual value, and L = the estimated years of life, is that recommended as be-

NEW PAIGE FACTORY.

Modern Building to Be Erected to House Entire Organization of the Company.

Plans are ready for operations on the new plant of the Paige-Detroit Motor Car Company, Detroit, maker of Paige cars, which is to be of the most modern construction and complete with every requirement for the latest efficiency methods in manufacturing. The total floor space will be 225,000 feet and the new machinery will be of special design for the production of car parts of the utmost precision and with the greatest economy.

Large sized presses, planers, boring machines, drilling machines and automatic lathes will be installed. The buildings will be of reinforced concrete and will be in the form of a large H, containing space sufficient to house the company's entire organization. Practically all of the wall surface will be of glass, except for the supporting piers into which the steel sash are to be set. Ribbed glass will be used on the front, which will face the west, diminishing the glare of the sun and at the same time admitting all the light. Plain glass will be used on the east side.

To the personnel of the Paige company is ascribed its rapid rise to success, which makes the new plant necessary. The organization includes the following well known Detroit business men: Harry M. Jewett, E. H. Jewett, Gilbert W. Lee, William B. Cady, C. B. Warren, Charles H. Hodges, E. D. Stair, Sherman L. Depew and Willis E. Buhl. H. M. Jewett is president. James F. Bourquin is general manager and Henry Krohn is sales manager.

SECURES LARGE ORDER.

Heinze Electric Company Is Enjoying Good Business—Branch Canadian Plant.

The Heinze Electric Company, Lowell, Mass., which is establishing a factory at Walkersville, Ont., to care for its Canadian trade, thus allowing the Lowell plant to be the headquarters for the trade in the United States, has closed a contract with the Ford Motor Company, Detroit, maker of Ford cars, to furnish electric coils for Ford machines. The contract is understood to be for a figure in excess of $1,000,000.

This will mean the operation of the Heinze company's three factories at Lowell on a day and night basis for many months. Over 500 skilled workmen are employed and the company is enjoying remarkable prosperity. The officials of the concern are: President, Paul Butler; treasurer, Col. Butler Ames; assistant treasurer and clerk, Joseph A. Legare. Recently the latter resigned his position of postmaster of Lowell to devote his entire time to the rapidly growing business of the Heinze company.

WEBER IS GENERAL MANAGER.

Will Take Charge of the Production of New Vaughan Six-Cylinder Car.

As announced recently, the Vaughan Car Company has been organized to resume the production of Vaughan cars in the old factory of Wyckoff, Church & Partridge, Inc., at Kingston, N. Y. The following officers have been elected: President, A. B. Cordner; vice president and general manager, Orlando Weber; treasurer, H. W. Johns; secretary and sales manager, Ernest S. Partridge; consulting engineer, Chester Griswold; directors, Britton N. Bush of Hollins & Co., banker; Howard Dickinson, Kearney & Dickinson, lawyer; William Swan, capitalist; George A. Ellis, Booth & Ellis, lawyer; H. Walter Webb, capitalist; Orlando Weber, A. B. Cordner, Equitable Life Assurance Company; H. W. Johns, capitalist; Chester Griswold, E. S. Partridge.

Orlando Weber, General Manager Vaughan Car Company.

By the election of Orlando Weber as vice president and general manager the company secures the services of a man of long experience in the automobile business. Since its inception he has been most active in both the manufacturing and sales departments of the business. He will make his headquarters at Kingston and will be in direct charge of the new undertaking.

It is understood that plans have been made

Digitized by Google

for the production of 500 machines for the 1914 season, and that these will be designed to meet the demand for a popular priced six-cylinder car. The bodies are to be from specifications supplied by one of the leading body builders in America.

BECOMES GENERAL MANAGER.

A. G. Seiberling Wins Deserved Promotion with Haynes Automobile Company.

The most recent appointment announced by the Haynes Automobile Company, Kokomo, Ind., maker of Haynes cars, is that of A. G. Seiberling as general manager of the company to succeed C. B. Warren. Since October, 1912, Mr. Seiberling has been connected with the Haynes concern as factory manager and he assumed his new duties June 1.

A. G. Seiberling, General Manager, Haynes Automobile Company.

His executive ability has been demonstrated in various lines of endeavor extending over a period of 25 years. He was born at Akron, O., the home of the automobile tire and accessory industry, and after becoming familiar with the products of that city he removed to Kokomo in 1887 to take a position in the bookkeping and purchasing departments of the Kokomo Strawboard Company. Six months later he was appointed treasurer and purchasing agent of the Diamond Plate Glass Company, an office he held until 1895, when the company was absorbed by the Pittsburg Plate Glass Company, Pittsburg, Penn., Mr. Seiberling then becoming identified with the parent concern, as general purchasing agent with headquarters at Pittsburg. He next became interested in the rubber industry and moved to Peoria, Ill., where he organized the Peoria Rubber & Manufacturing Company in 1896. This concern developed into a successful enterprise and was consolidated with the American Bicycle Company in 1900.

Mr. Seiberling then became financially interested in the Great Western Plate Glass Company of Ottawa, Ill., and he remained with the concern until it was sold in 1905. Returning to Kokomo he entered the automobile industry and has remained there since. His appointment to the Haynes organization is a recognition of his ability, displayed while connected in an executive capacity with various Kokomo automobile manufacturers. He is enthusiastic over the future of the Haynes company and with the prestige of the firm name he is confident that the energetic campaign about to be launched will place the company in a new era of prosperity.

STOCKHOLDERS APPROVE ACTION.

Annual Meeting of United States Rubber Company Indorses Work of Directors.

At the annual meeting of the stockholders of the United States Rubber Company, held at the company's office at New Brunswick, N. S., President Samuel P. Colt presided and resolutions were adopted approving actions of the directors since the last annual election, and also an amendment changing the date of the annual meeting from the third Tuesday in May each year to the third Tuesday in March.

The directors nominated and elected unanimously were: Walter S. Ballou, E. C. Benedict, Anthony N. Brady, Samuel P. Colt, Harry E. Converse, James Deshler, James B. Ford, Frank S. Hastings, Arthur L. Kelley, Lester Leland, D. Lorne McGibbon, Raymond B. Price, Homer E. Sawyer, Frederick M. Shepard, William H. Truesdale, Theodore N. Vail, John D. Vermeule and Elisha S. Williams.

ORGANIZE SALES COMPANY.

Harry S. Houpt and L. A. Van Patten Head New Concern in New York City.

Harry S. Houpt, formerly general sales manager of the American Locomotive Company, New York City, maker of Alco machines, has organized the Henry S. Houpt Company for the sale of Lozier cars in that district. The Lozier Motor Company, Detroit, has maintained a sales branch in New York for a number of years, but it is announced that this will be abandoned in the immediate future.

Mr. Houpt has long been identified with the industry, having taken charge of the sale of the Thomas line in the earlier days. About two

Digitized by Google

months ago he resigned from the American Locomotive Company to become vice president of a large elevator company in New York. Mr. Van Patten, who will be vice president and sales manager of the new concern, formerly was advertising manager for the Alco.

SELLING HARRIS OILS.

A. W. Harris Oil Company of Providence, R. I., Wins Two Legal Actions.

The A. W. Harris Oil Company, Providence, R. I., maker of Harris automobile lubricants, has recently conducted successfully two suits against others alleging infringement of its trade mark and the improper use of the name Harris in connection with the oil business. The defendants were James C. Harris, doing business as the Harris Oil Company, Muncie, Ind., and the Parker Refining Company.

In prosecuting these actions the A. W. Harris Oil Company maintained that it had been using the name Harris in connection with the oil business since 1885, and that the name had acquired a reputation here and abroad as denoting oils prepared by the A. W. Harris Oil Company of Providence, R. I. Injunctions were desired in each instance.

The United States court in Indiana has enjoined James C. Harris, his agents or associates, from the use of the name Harris or Harris Oil Company, in connection with the business of selling oils or in advertisements, unless preceded by "James C." and followed by "of Muncie, Ind.," in the same size and style of type, and unless accompanied by some statement showing that the oils sold are not the original oils of the A. W. Harris Oil Company. The defendant also is enjoined from the use of containers similar to those of the plaintiff.

The United States court in Ohio issued a perpetual injunction against the Parker Refining Company prohibiting the use of the name Harris in connection with the sale of oils or its use in advertisements or on labels, or the use of a word of similar sound or appearance.

INCREASES CAPITAL STOCK.

Fisher Body Company Secures Funds with Which to Erect Buildings.

Large extensions to the plant of the Fisher Body Company, Detroit, are to be made following the recent action of the company in increasing its capital stock from $50,000 to $1,600,000. The additional capital gives the Fisher company $1,100,000 of common stock, of which $800,000 is paid in, and $500,000 of preferred stock, $100,000 of which has been sold, while subscriptions are being received for $400,000.

A portion of the funds derived from the sale of new stock will be employed in completing and equipping with machinery the six-story factory building of mill construction which the company started last year at Harper avenue and Hastings street. This building will afford additional space for the limousine and closed body branch of the plant.

A second new building, five stories high, will be erected on Piquette avenue, equipped to give space for extension of the open body business.

WAGNER WITH AJAX TIRES.

Well Known Advertising Man Becomes Vice President of the Company.

Fred J. Wagner, who has long been identified with the automobile industry in various capacities, has been elected vice president of the Ajax-Grieb Rubber Company, New York City, maker of Ajax tires. Recently Mr. Wagner retired from Horseless Age, in which he was a part owner, and this announcement comes somewhat in the nature of a surprise.

Mr. Wagner's first connection with the automobile business was as advertising director for trade publications, in which work he has enjoyed decided success. Later he became identified with the contest board and has officiated as starter in a large number of the more important events. His many friends will wish him the same measure of success in his new venture.

SEPARATE ACCESSORY SHOW.

National Association Considering the Possibilities for Next Year.

The Motor & Accessory Manufacturers has under consideration the question as to whether or not the interests of the automobile motor and parts producers would best be conserved by a separate show in Madison Square Garden, or by participating with the car builders in the display at Grand Central Palace, New York City. It is possible that motorcycle and motorcycle parts makers will be invited to co-operate with this organization in case the decision is in favor of the former proposition.

NEW HIGHWAY POLICY.

New York Commissioner Rules Against Changes in Original Specifications.

John N. Carlisle, New York state commissioner of highways, has issued a statement in which he makes clear his stand with reference to strict contract regulation of highway work, and declares he will approve of no more special agreements on highway improvement which include items not provided for in the original contract. This method of charging contracts, which was held, in the last analysis, to amount to the giving of an entirely new contract without competitive bidding, has been a matter for considerable criticism in the past.

Another ruling by Mr. Carlisle sets forth that no allowance will be made by his department for construction in incorporated villages and towns except the amount necessary to lay a pavement 16 feet wide of a type of construction that prevails on each side of the village or city. Heretofore, money that has been appropriated for the improvement of highways has been used for paving streets in smaller cities and towns. In the future, any locality desiring a better type of paving than that provided in the contract will be obliged to pay the entire expense, less the cost of state construction of a roadway according to the contract specifications.

A HOME-MADE FILTER.

Chas. E. Miller Makes Practical Suggestion for Saving in Oil Expense.

Chas. E. Miller, accessory and supply dealer of 97-103 Reade street, New York City, gives some interesting advice to motorists on the handling and conservation of lubricating oils. "In the home workshop," he says, "and especially where there is an automobile to be taken care of, much valuable lubricating oil must be thrown away when it becomes too dirty or gummy for further use, and yet the quantity is not sufficient to warrant the purchase of an oil filter. Practically all of the wasted oil could be saved and made as good as new by the use of an inexpensive home-made filter.

"Consider the Ward method as suggested in Oildom, which consists of a six by eight-inch glass battery jar, or other suitable vessel provided with a wooden cover having a large circular opening in the middle. Into this opening is fitted a cone made of wire gauze or mosquito netting, held in place by a few carpet tacks. When placed over the jar this serves as a support for a paper filter cone, which for ordinary grades of machine oil is best made up of two thicknesses of ordinary light brown manila wrapping paper, folded carefully so as to avoid tearing.

"After the dirty oil is placed in the paper cone it takes some little time for the filtered oil to begin to drip through, but it will be found that if the apparatus is left to itself for a few days, a surprising amount of clean, pure oil will accumulate in the glass jar. By the use of paper of a suitable texture, even the hopelessly black and gritty oil wrung out from the waste with which the engine drip pans are mopped up, may thus be purified for further usefulness."

ARMY MEN ON TOUR.

Soldiers from Fort Benjamin Harrison in Transcontinental Event.

The tour committee of the Indiana Automobile Manufacturers' Association has enlisted the assistance of the soldiers at Fort Benjamin Harrison, Ind., in looking after the commissary details for its transcontinental tour, which is scheduled to start from Indianapolis, July 1, with San Francisco as its objective point. The committee had little trouble in securing this concession from the commandant of the fort, particularly as it is expected that several motor trucks will accompany the tourists. The army men are very much interested in this feature of the event and will study the adaptability of the motor transport in this work.

At least three trucks will be used entirely by the commissary department for the transportation of food, cooking utensils, etc., these being under the direct charge of the soldiers. In addition, trucks will be utilized for the transportation of gasoline, water and oil for emergency uses in the sparsely settled districts, and still others will be required to carry the wireless telegraphy instruments. It is anticipated that this feature of the tour will be one of the most valuable in many respects, and it is not at all surprising that the army men should have been glad to lend their assistance in this manner.

The Long Island Automobile Club, Brooklyn, N. Y., Charles Herman, president, has purchased a site for an $85,000 club house fronting on Eastern Parkway, opposite the Brooklyn Museum of Arts and Sciences. The proposed building will include a large assembly hall.

Digitized by Google

NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS.

Leak-Proof Piston Ring.

Much of the poor compression existing in motors is due to worn and consequently poor fitting piston rings. This results in lost power and the lubricant works up into the combustion chamber, creating carbon as well as causing ignition trouble through dirty or fouled spark plugs. These troubles are overcome in the Leak-Proof piston rings, so named because their mechanical construction is such that the gases cannot pass between the slots. There are two of these members, but they may be said to be practically sealed in that the mixture cannot escape on the compression stroke. The tension of the ring is even throughout, preventing wear of the cylinder walls at any one place as well as scoring. The rings are constructed in sizes to meet all requirements and it is not necessary to make any alterations to the piston. The Leak-Proof rings are marketed by the Motor Parts Company, 185-7 Columbus avenue, Boston, and 818 North Broad street, Philadelphia.

Crowe Master Vibrator.

The Lisle Manufacturing Company, 123 Main street, Clarinda, Ia., is marketing the Crowe master vibrator, which differs from those of usual construction in that it is non-adjustable. It is designed for model T Ford automobiles and is noticeable for its compactness and neat design, being but 2.5 inches in diameter. The company points out that the non-adjustable feature is important in that the vibrator always delivers the same hot spark and that the unit does not require any attention whatsoever after installation. Although designed to be utilized in connection with the flywheel magneto it can be operated as successfully when the source of current supply is dry cells or a storage battery. The Crowe vibrator is constructed of high grade material and the workmanship is first class in every respect.

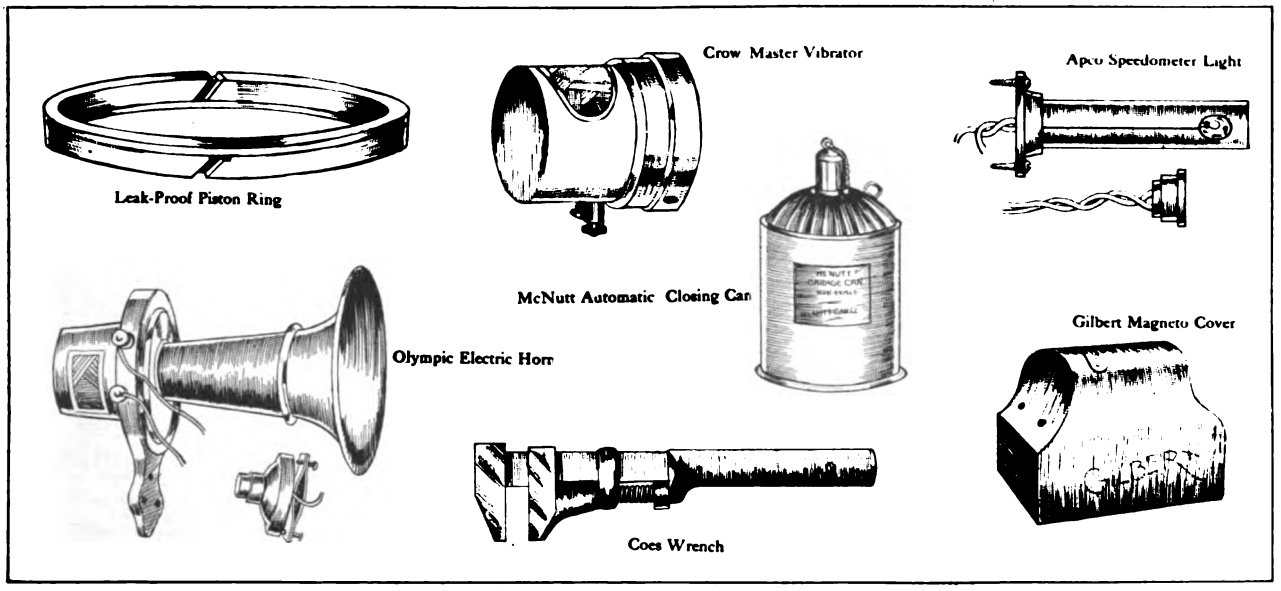
McNutt Automatic Closing Can.

The McNutt Non-Explosive Can Company, 352 Pearl street, New York City, is manufacturing the McNutt automatic closing can, which is produced in five and 10-gallon types. The containers are equipped with the McNutt patent safety device, which prevents explosions as well as the loss of gasoline. They are constructed of a high grade material and to withstand severe service. The company also markets self-closing fuel cans in capacities ranging from one gallon to five. They are adaptable for private and public garages.

Apco Electric Speedometer Light.

The Auto Parts Company, Providence, R. I., is marketing the Apco electric speedometer light, an inexpensive lamp which comes complete with all fittings. The light proper comprises a 3.5-inch dash bracket with a silver plated reflector and a 2.5 candlepower tungsten bulb. The bracket is mounted over the speedometer by two screws, and illuminates the dial when the circuit is closed by a switch. The latter is a pearl faced push button which is located on the heel board or in any other convenient place. A quality of the outfit is that the lamp may be maintained about 50 hours by a single dry cell. The latter is installed under the seat or in the tool box. Eight feet of double cord wire is supplied with each equipment, and complete directions accompany each light.

Olympic Electric Horn.



One of the latest types of moderately priced high grade electric horns is the Olympic, for which the Kolb Sales Company, 1790 Broadway, New York City, is distributor. It is of the vibrator type, but it is stated to be constructed on an entirely new principle, one eliminating all sparking and subsequent burning of the contact points. It is also held that the design is very simple and that adjustments are not required even after considerable service. Economy of current is emphasized, less than 1.25 amperes being utilized to obtain maximum efficiency. The sound is far reaching, but is free from harshness or discord. The Olympic is constructed in two styles, black enamel with nickel snare, or a metallic, brass or nickel finish. A suitable length of double cord wire and a high grade push button accompany each horn.

Coes Screw Wrench.

The Coes screw wrench, made by the Coes Wrench Company, Worcester, Mass., is a valuable addition to the tool equipment of both the owner and the garage. It is designed to withstand extra heavy service and being all metal is not subject to broken handles, etc. The bar is of steel, fully hardened and cold swaged, while the jaw is made extra heavy, of semi-steel and hardened. The screw is steel, a one-piece construction, not a screw plus a moving dowel and a hidden spring, and is provided with a polished and hardened ball race. The handle is a semi-steel casting, internally supported and retained by cross riveting, and the extension of the bar through the handle is also riveted.

Regent Breast Drill-Valve Grinder.

The Regent breast drill and valve grinder is manufactured by P. G. H. Bennet & Co., Lansdowne street, Fenway, Boston, and is a combination instrument. It is designed for the owner and repair shop and may be carried easily in the tool box of the car by removing the handles. It is furnished with a Star expansion chuck, taking drills up to .25 inch, a screw driver blade for slotted valve heads and screws, four spanner tools to fit different makes of cars, and a coil spring. The last named is fitted under the valve when grinding. One of the features of the tool is that it may be changed easily

Digitized by Google

and quickly from a breast drill to a valve grinder or vice versa, by a simple movement of the index finger. This is accomplished by actuating a shifting trigger. By utilizing this member when grinding valves, the motion can be changed instantly to a reciprocating one of about 45 degrees.

Gilbert Magneto Cover.

It is important that the magneto be protected against foreign elements, especially road dust. The latter acts as an abrasive and unless removed subjects the working parts to undue wear. The Gilbert Manufacturing Company, New Haven, produces a variety of designs in magneto covers and carries in stock members to fit all standard types of magnetos. The covers are made in two types, a heavy sole and a patent leather. They are also made for motorcycle magnetos.

Albex Folding Goggles.

One of the qualities of the Albex folding goggles, which are made in two styles by T. A. Wilson & Co., Reading, Penn., is that they may be worn over the regular glasses without discomfort. It is held that the Albex goggles conform to the lines of the face without pressure and the bridge is of a special braid instead of the usual nose piece. They are very light, well ventilated and can be folded very compactly. Tinted, curved, circular lenses, Fieuzal glass are utilized, and it is pointed out that they admit all the light, assisting vision, while shutting out the harmful ultra-violet rays, giving all shades and colors their natural values.

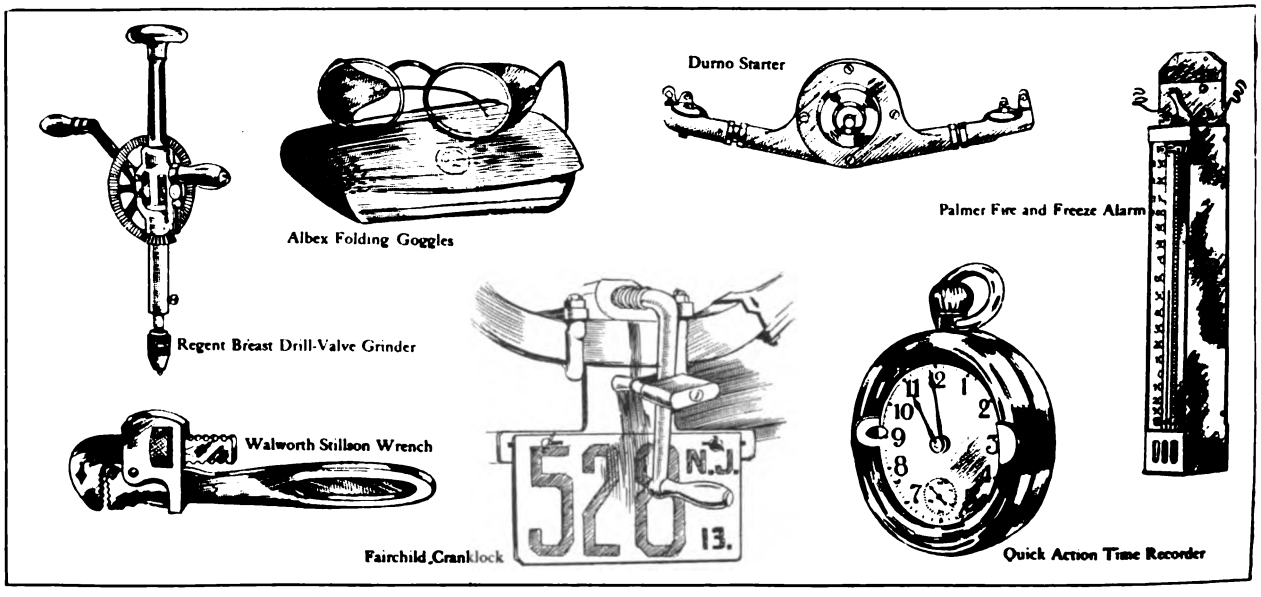
Durno Motor Starter.

The Durno motor starter, marketed by the Durno Manufacturing Company, Rochester, N. Y., is of the compressed air type. It differs from the conventional air starters in that the pressure is utilized to actuate a mechanical device. The latter comprises a drum fitted to the front of the car and carrying an auxiliary shaft engaging with that of the motor. The drum carries a chain attached to a rod and connected to a piston rod of a cylinder having a four-inch bore and 12.5-inch stroke. Air is admitted to the cylinder from a pressure tank which is supplied by a four-cylinder air pump operated by the motor. Pressing a lever in the footboard of the car allows the air to flow to the cylinder member, forcing the piston backward and unwinding the chain on the drum. At the same time the auxiliary shaft is thrown into engagement with the motor shaft, spinning the latter, and it is held that the energy is imparted slowly at first. The system is provided with a night valve for the purpose of preventing escape of air when the car is not in service. A tire inflator is part of the equipment, and includes suitable length of tubing and a gauge.

Palmer Fire and Freeze Alarm.

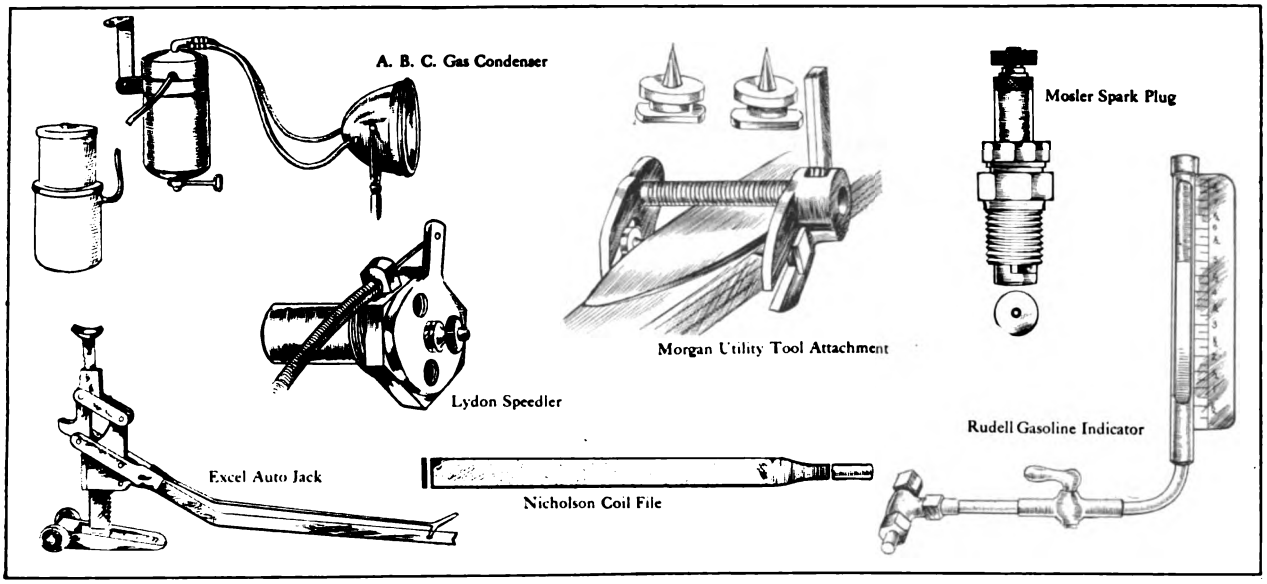
R. P. Palmer & Co., Cincinnati, O., maker of thermometers and thermostats, has brought out an automatic fire and freeze alarm designed to give warning by a bell should the temperature rise to a fire or fall to a freezing point in the building in which the system is installed. It comprises two units, the mercury thermometer member and the signal. The former automatically closes the circuit and rings the bell in the house when the temperature falls to the freezing point or rises to that of fires. The device has a switch which can be set on fire and freeze, or fire only, the latter point being used when necessary precautions have been taken to prevent freezing. There is also a cut-out switch on the bell case. A conventional dry cell will operate the system six months and 150 feet of wire and complete instructions accompany each equipment.

Walworth Stillson Wrench.



One of the most useful wrenches in the garage or tool kit is the Stillson, which comes in various sizes to meet individual requirements. These members are made by the Walworth Manufacturing Company, Boston, and that constructed especially for the motor car is the 10-inch size, which takes pipes from .125 inch to one. The wrenches are constructed of the best tool steel and are furnished in the following styles of finish: Polished, rustless black lacquer, polished nickel plated and rustless nickel plated. The company also manufactures an eight-inch automobile wrench suitable for piping up to .75 inch.

Fairchild Cranklock.



A large number of automobiles are stolen each month and the activity of motor car thieves has been responsible for the marketing of locking devices, among which is the Cranklock, manufactured by H. C. Fairchild, Maplewood, N. J. The device is simple and presents practical features in that not only is the starting crank locked securely, but also serves as a license number bracket. The Cranklock is designed for model T Ford cars and is attached to the front cross member of the frame, being retained by the usual clips. A stud or bolt projects horizontally from the vertical plate, and has an opening into which the loop of the lock is fitted. To lock the machine the starting handle is placed within the loop and the lock proper snapped into place, preventing movement of the starting handle. When not in use the lock does not interfere with the operation of the handle.

Quick Action Time Recorder.

The Quick Action time recorder and watch holder is manufactured by the Henry T. Adams Company, 6823 South Chicago avenue, Chicago, and is adapted to motor cars, motorcycles, motor boats, etc. When utilized on the automobile it is attached to the spoke of the steering wheel, although it may be fitted to the windshield, dash, coil or other convenient place. It carries two indicating hands, one for the minutes and the other for the hours, and these can be set instantly by pressing down on the watch. The markers are utilized to denote the time of leaving or when due, and serve as a reminder to the

Digitized by Google

driver of an appointment, etc. They can also be employed to denote the time of leaving when one wishes to ascertain the time consumed on a trip. The clamp is universal and will fit any machine.

A. B. C. Gas Condenser and Purifier.

Chas. E. Miller, 97-103 Reade street, New York City, is marketing the A. B. C. gas condenser and purifier, which is a patented device for incorporating in the line between the supply of acetylene and the lamps. When a generator is utilized more or less moisture collects in the tubing and unless the fluid be removed the efficiency of the flame is impaired and sometimes a driving light cannot be obtained. The A. B. C. is a vibration gravity separator, which is guaranteed to abstract all moisture and impurities from the gas, and to prevent carbonization at the burners. It requires no adjustment, or the replacing of packing, etc., and once installed relieves the driver of the trouble of cleaning the tubing and burners. Economy of acetylene is also emphasized.

Morgan Utility Tool Attachment.

The Morgan Manufacturing Company, Newport, R. I., has brought out a new attachment for the utility tool made by this concern, it being a spring spreading or opening device. This is so arranged as to fit into the slotted portions of the utility tool and when the latter is operated the pointed members separate the leaves of the spring sufficiently to permit of cleaning and lubricating.

Mosler Spit Fire Spark Plug.

The marketing of low grade motor fuel makes it imperative that the motorist give the ignition closer attention than formerly as a hotter spark is required for starting. A spark plug is a spark plug to many owners who do not take into consideration that one adapted to the type of the engine is necessary to obtain maximum efficiency. The A. R. Mosler Company, 163 West Twenty-ninth street, New York City, electrical engineer, has developed the well known Spit Fire plug to a high degree of efficiency and it is produced in various lengths to meet the requirements of different types of motors. One of the features of the plug is the practically closed end, flat base entering the cylinder. It not only forms a compression chamber, heating the compressed mixture, but protects the sparking point from carbon or soot. The construction causes a flame of fire to be shot into the combustion chamber, fully igniting the gas.

Excel Auto Jack.

The Excel auto jack is marketed by the Excel Jack Manufacturing Company, 27 Lansdowne street, Fenway, Boston, and is designed for the private and public garage and repair shop. It is rapid and positive in action, occupies but little room and is a time saver in that it can be operated without stooping or risks to the user. It is provided with a swivel to permit of its use at any angle, and a toe is included for service where the top piece is too high. The initial adjustment is instantaneous and the jack has a lifting capacity of 6000 pounds. Its height when raised is 25 inches, when closed nine, and the weight is 35 pounds. It is made of steel, the housing being cast steel and lever a steel forging. The carriage is mounted on rollers, making for convenience and the jack lifts from either hub or axle.

Lydon Speedler.

The Lydon Speedler is the product of the Lydon Manufacturing Company, 1146 Michigan avenue, Chicago, and one of its uses is to correct or revaporize the mixture in the intake manifold. It comprises three parts, the controller, which is attached to the steering column; the sprayler, which is screwed into the intake manifold between the carburetor and the cylinders, and a flexible connection. The sprayler part has a number of suitable openings and is made in various sizes to meet the requirements of installation. The exterior portion of the device is provided with a movable shutter which uncloses and opens air inspirators or ports, and control of the shutter is by a flexible wire construction, the lever of which is mounted on the steering column. By moving the lever the size of the ports is increased or diminished to obtain the needed amount of air for creating a uniform mixture. The principle function of the Speedler is to break up and convert into a useful mixture particles of raw fuel not vaporized by the carburetor. This not only makes for economy, but provides more power, as it is possible to correct faulty operation of the carburetor without leaving the seat and when the motor is operating under a load. Starting is made easier as the low speed may be made slightly rich and compensated for by admitting more air through the ports of the Speedler. It may be used as a brake by shutting off the power and allowing cool, fresh air to pass through the cylinders. The ports may also be utilized for priming purposes.

Rudell Gasoline Indicator.

The Rudell gasoline indicator is manufactured by the Rudell Gasoline Indicator Company, Inc., 1044 South Olive street, Los Angeles, Cal. It differs from the usual gauges in that it is installed by inserting a T in the fuel line near the indicator. It operates on the gravity principle, and the maker points out that it registers accurately the amount of fuel on hand, also the quantity utilized. The indicator proper is calibrated to show half and full gallons and the height of the fuel is easily noted from the seat as the gauge is mounted on the dash.

Nicholson Coil File.

The Nicholson File Company, Providence, R. I., has brought out a file constructed especially for smoothing the platinum points of vibrators, magnetos, etc. As platinum is very expensive an ordinary file removes too much of the metal, and in addition is too clumsy to handle easily. The Nicholson file is made with a convenient handle attached and is inexpensive.

MECHANICAL NOTES FOR OWNERS.

Eliminating Objectionable Noises in the Rear Axle---Suggestion for Keeping Tires Dry---Simple Piston Ring Clamp---Restoring Dry Cells.

THE rear axle of the modern car rarely requires attention other than that of replenishing the supply of lubricant. There are three conditions which may arise and which may make adjustment of the gears necessary, these being objectionable noise, back lash and looseness between the bearings on pinion shaft or differential.

Different constructions will require different treatment. Some designs are very accessible, while others will require considerable work to reach the components needing attention. If it becomes necessary to make a minor adjustment the details of the axle should be well studied before attempting the work and the instruction book of the maker will be of decided value.

Showing Components Utilized in Making Adjustment of Gears in Timken Type of Rear Axle.

Timken rear axles, such as shown in an accompanying illustration, are so designed that the adjustment of the gears is easily accomplished and without disassembling. Assuming that the bevels hum unduly and that one desires to eliminate the objectionable noise: The first step is to loosen the locking nut A on the pinion shaft, also the nut B. Next displace the cover, loosen the clamp bolt H and turn the slotted adjusting cap toward the left one notch and tighten up nuts B and A, taking care not to have bearings so snug that the shaft will not rotate easily. If upon trying out the car the noise is found to be diminished, but not wholly eliminated, loosen nuts A and B and rotate adjusting cap another notch and so on until the quietest point is secured. If it is found that the noise is augmented, adjust in the opposite direction. As arrows show the direction of adjustment it should be made without trouble. Upon making the final adjustment, and there is no end play to the shaft, back off nut B a quarter turn and tighten up on nut A. Bend the washer over the flat of each nut, tighten up clamp bolt H and replace cover.

To remove back lash of the gears, back off adjusting ring at D toward the differential and turn the ring at C against the bearing cap, which will move the gear toward the pinion. These rings have a right hand thread. Before turning rings, however, loosen the cap screws on the bearing cap one-half turn, after removing the locking wires. The proper amount of back lash should be approximately .005 inch, or a barely perceptible looseness. After the work is completed, make sure that the locking pins are back in the slots of the rings, that the cap screws are tight and the locking wires in place. After making adjustments care should be taken to renew the supply of lubricant and according to the directions of the maker of the car.

Looseness in bearings on the pinion shaft is eliminated by easing nut A and taking up on nut B, just enough to allow the shaft to rotate freely without end play. By backing off nut B about a quarter inch the right adjustment should be obtained. Relock nut A. If noisy gears result the same methods should be pursued as already outlined. Play in the differential bearings is removed by the adjusting rings C and D, the position of these being changed until end play is eliminated and the differential rotates freely. The cap screws and locking wires will require attention as when removing back lash. In the case of back lash resulting from the work, it may be removed as previously explained. If it be found that the gears are too far out of mesh, or new members must be fitted, set the gears with the backs flush as a starting point and follow the directions outlined above. The position of the teeth may be ascertained by removing the peep hole cover shown in the drawing.

Digitized by Google

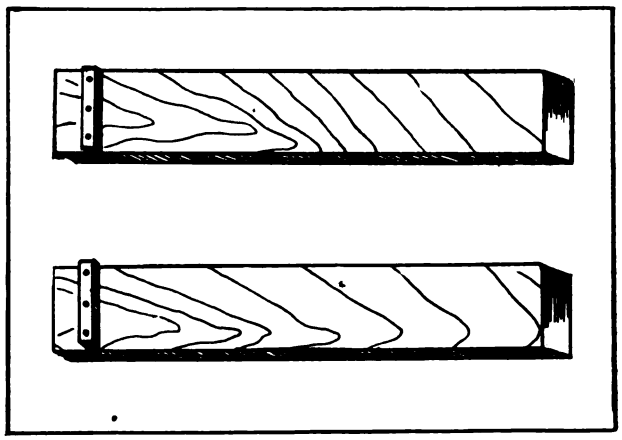
TIRE REST AND CAR STOP.

Tires should not be allowed to stand on moist ground as not only is the rubber affected, but the rims are likely to become rusted, creating trouble when changes must be made. A motorist having a place in the country and who keeps his machine in a building not equipped with a cement or wooden floor, contributes the following suggestion:

The building was originally constructed for other purposes, was set on posts and was not fitted with a floor. After considerable use the tires wore deep ruts, which held moisture, and after a storm the tires were kept constantly wet. I solved the problem by taking two pieces of joist about 10 by two inches and imbedding them in the ground as shown by the accompanying sketch. The joists were laid so that they were slightly higher at the front end where the front wheels rest so that the machine could be rolled out of the building with very little effort. This was done as there was not room in front to crank the motor.

With the car in the building and the doors closed there was no spare room in front or the rear, and as it was too much work to push the machine into its position, a chock was fitted to each board so that the car could be run in under its power and without danger of going through the side of the building if the brakes refused to hold. The blocks also served to denote the proper stopping place. The suggestion may be of value to your readers who have similar places in the country.

SIMPLE PISTON CLAMP.



There are a number of tools, easily made and inexpensive, that can be constructed by the owner-repairman. Among them may be mentioned a piston ring clamp for holding the rings in place while the cylinder is being slipped over the piston. Assuming that the piston is 4.25 inches in diameter: Take a strip of band iron .125 inch thick, .5 inch wide and 16 long. Bend the metal into a circle, measure off 1.5 inches on each end, marking the distances. Place the ends in the vise and bend them over. This will provide extensions which may be gripped by the pliers when the clamp encircles the ring. The band should be slightly less than 4.25 inches in diameter to compress the ring fully. To use the clamp, place it over the top ring and draw the ends of the band together with a pair of pliers while an assistant slips the cylinder over the head of the piston and ring. Upon the latter being caught the pliers may be released and the clamp used on the next ring and so on.

WATER PROOFING THE WINDSHIELD.

While preparations may be purchased for rain proofing the glass windshield, a solution made from soap will serve and it is said that the raindrops will slide off and moisture will be prevented from gathering. Take a small quantity of semi-liquid or soft soap, or make a paste of ordinary soap and water, and smear a little over each side of the glass. Then with a handful of waste or with a soft cloth rub the solution evenly over the entire surface so that a fine film remains. If it is well distributed and rubbed, so that the surplus soap is removed, it cannot be detected when the screen is dry.

CLEANING TIRE COVERS.

Stained leather tire covers can be cleaned and be made to look as good as new by applying the following mixture: Pour carbon bisulphide on non-vulcanized gutta-percha, and allow it to stand 24 hours. After shaking well add more gutta-percha gradually until the solution becomes of a gelatinous consistency. Apply to leather and allow to dry about three hours. To

Suggestion from a Reader for Preserving Tires from Dampness in Garage Not Equipped with Floor.

remove gutta-percha, rub with fingers and roll off. The color is not injured in the least, only those leathers on which a dressing containing starch has been used look a little lighter in color. The dry gutta-percha can be dissolved in sulpheret of carbon and used over again.

RESTORING DRY CELLS.

Various methods are given for temporarily restoring dead dry cells, among which may be mentioned drilling through the sealing material and moistening the depolarizer with a little water and vinegar. The following hint is given by a battery concern: Take a piece of hard wood and with a light hammer drive down the material surrounding the carbon post. It is said that amperage is increased considerably by this action.

ADJUSTING STROMBERG CARBURETORS.

TO OBTAIN efficiency and economy the motorist should have at least a practical knowledge of the carburetor fitted to his machine. Ad-

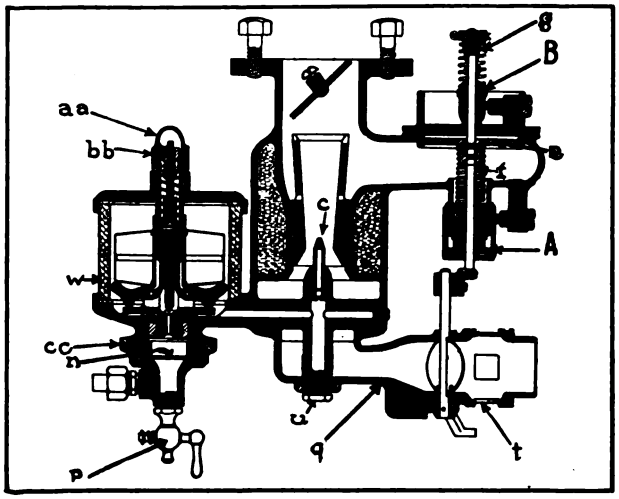

Fig. 1—Sectional View of Type A Stromberg Carburetor Showing Low Speed Adjusting Nut A and High Speed Adjusting Nut B—Type B Is Similar, Being Adjusted in the Same Manner.

mitting that the carburetor is adjusted properly when the car leaves the factory, it does not follow that the setting will not be altered by the employees of the agent in an endeavor to add to the motor's power or to increase the speed of the machine. And if the automobile was delivered late in the winter or early in the spring the mixture is likely to be rich on the low speed, a setting making for easy starting in cold weather.

An efficient mixture is one having the correct proportions of air and fuel at all motor speeds. Too much gasoline impairs the operation of the motor in that soot is deposited in the cylinders and muffler, and undesirable temperatures are created. In other words, all of the fuel is not being converted into useful energy. And with the present high price of motor fuel the cost of maintenance is increased considerably by an improperly adjusted carburetor.

The writer does not advocate tampering with the carburetor, provided it is performing its function satisfactorily and is delivering its maximum mileage to a gallon of fuel. On the other hand, one is warranted in checking up its performance and in altering the adjustments if the mileage is below normal or erratic operation of the power plant can be traced to defective carburetion. Climatic changes affect carburetion, such as high altitudes, cold and warm weather, necessitating slight augmentation or decrease in the amount of fuel or air. The effect of high altitudes is well known to the experienced motorist when touring in the mountains.

The modern carburetor rarely gives trouble after being properly set, but a number of conditions may arise on the road, such as a choked spraying nozzle, etc., and if one be familiar with the components and operation of the vaporizer, the fault may be corrected without impairing its efficiency. It is the intention of the writer to present the different types of carburetors, describing their practical side, and showing the components utilized in making adjustments. As it is not always convenient to call upon the expert to make a slight alteration, the suggestions contained herein should enable one to correct minor troubles.

Stromberg, Types A, B, C, D, G.

The Stromberg carburetors, manufactured by the Stromberg Motor Devices Company, Chicago, are made in five types, A, B, C, D, and G, respectively, and are easily distinguished from other designs by the glass float chamber. Each model is plainly marked and as the proper nozzle is fitted at the factory, instructions as to the selection of the required size will not be necessary. Types A and B are single jet carburetors, while C, D and G have double jets. By this is meant that the first named vaporizers have a single orifice through which the fuel is drawn while the others have an auxiliary jet, the function of which is to supply the necessary volume of gasoline for high motor speeds and for heavy duty work. All models have a fixed and auxiliary air inlet and are also provided with a high and low speed adjustment. In the accompanying illustrations the low speed adjusting nut is indicated by the letter A and the high by the letter B. The other components are also lettered.

Types A and B.

Types A and B differ only in that the latter is of the concentric, non-water jacketed type. As the adjustment of both is similar they will be treated as a single unit. The level of the fuel in the float chamber, Fig. 1, is important and with type A it should be about one inch from

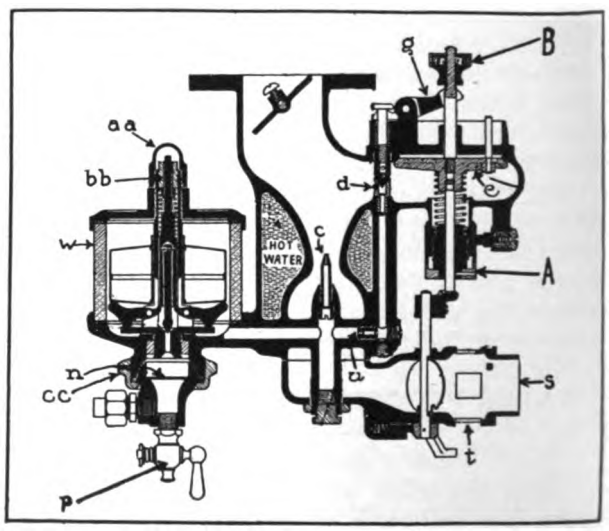

Fig. 2—Type C Stromberg Carburetor Having Auxiliary Jet for High Speeds—The Low and High Speed Adjustment Is by Nuts A and B Respectively.

Digitized by Google

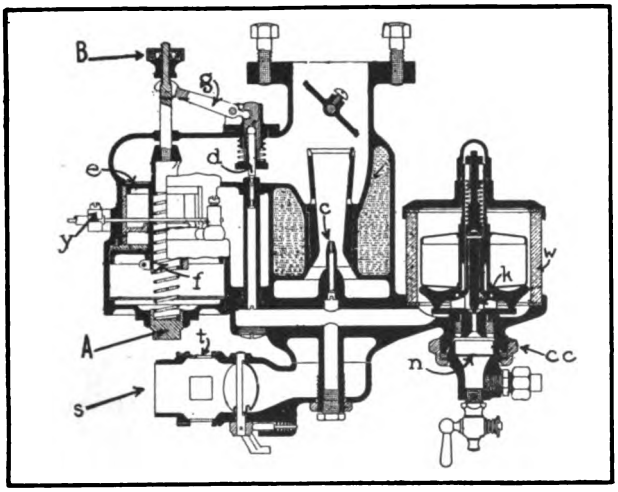

Fig. 3—Type D, Utilized with Six-Cylinder Motors and Having High Speed Adjustment Controlled by Dash or Steering Post Device.

the lower edge of the glass. The proper level with type B is .9375 inch. This level is adjusted at the factory, but if the fuel be too high, remove the dust cap a a and screw down the adjusting screw b b. If too low, screw it up.

The low speed is adjusted by the nut A, which controls the low speed spring f seating the valve e. This valve should seat lightly and care should be taken to have about .06125-inch play in the high speed spring g. By turning the nut A up or down the desired even, idle running of motor is secured. Stops are provided on the throttle valve lever, and by moving the screws in or out the desired motor speed may be obtained. The position of these screws should be taken into consideration when making low speed adjustments.

The high speed adjustment B is operated by turning the nut up to enrich the mixture and in the opposite direction to weaken it. The high speed spring g should always have at least .03125 inch play when the motor is running idle. Both the low and high speed adjusting members should be turned a notch at a time only in making adjustments. The type A carburetor is fitted with a season adjustment t, which should be open in summer and closed in cold weather. Type B is not equipped with this device.

Adjusting Type C.

The type C, Fig. 2, is designed especially for six-cylinder motors, and in addition to the usual spray nozzle c in the venturi tube, has a second jet d, which is automatically opened by the auxiliary air valve e. The second jet comes into action when the speed of the motor demands fuel in excess of the capacity of the primary nozzle. As the air valve e moves downward the auxiliary needle d is raised by a lever g, augmenting the supply of fuel proportionately to the speed of the engine. The low speed adjustment is made in the same manner as with types A and B, but it should be borne in mind that the auxiliary air valve should not operate when the motor is idling as all air should be supplied through s. The capacity of the primary or low speed nozzle is held by the maker to be ample for speeds up to 25 miles an hour. The high speed is regulated by the nut B, which should be about .09375 inch above the lever g for normal adjustment, although it may be altered to meet the requirements of the motor. Lowering the nut B brings the auxiliary or second jet into service quicker, while raising it weakens the mixture. Adjustments should be made with the spark advanced for high speeds.

Setting Type D.

The type D shown at Fig. 3 differs from those previously described in that the auxiliary air is regulated by a shutter operated by a dash or steering post control, providing adjusting means from the seat. Two nozzles are utilized, a primary c and auxiliary d. In adjusting this type the lever on the control member is moved to close the shutter around the air valve. After starting the motor, open the shutter about three-quarters way. For low speed or idle running the high speed nut B should clear the lever g about .03125 inch. The auxiliary air valve e should be on its seat. If not, loosen lock nut on A and turn up the latter until valve seats, and relock. This rarely requires attention, being set at the factory.

High motor speeds are taken care of by the auxiliary gasoline needle member d, and should the motor back fire with the shutter three-quarters open, and spark advanced and throttle open, it indicates that sufficient fuel is not being supplied by the nozzle d. This condition is not likely to exist as the proper needle is fitted at the factory. This type of carburetor presents advantages in that the control of the high speed is by means of the air valve shutter from the seat.

Adjustment of Type G.

Type G, Fig. 4, has a double jet, although it is made with a single member. It has a low speed adjustment A and high B, and these members are set as with types A and B. The dash or post control permits of weakening or enriching the mixture as may be required, and when moved to "rich" closes the fixed and auxiliary air inlets, making for easy starting in cold weather. With the lever one-third or one-half way toward "lean" a portion of the fixed air port is opened and the auxiliary partially. This enables economical operation. The control members are shown at Fig. 4 and are as follows: Fixed air inlet, s; control lever, v; rod leading to dash, e e; air shut-off for starting, r; season adjustment, t. The last named should be open in warm weather as with the other types.

It is an excellent practise occasionally to open the cock p and drain off about half a cup of fuel. Failure to strain the gasoline may result in the strainer n becoming clogged. It is accessible by loosening the coupling nut c c. In the event of accident requiring the replacement of nozzles with new members, those of types A and B are reached by removing the plug u and displacing the nozzle with a screw driver. The primary nozzles of types C, D and G are accessible in a similar manner, but the auxiliary of C is reached by removing the slotted plug in the gasoline channel opposite u. The high speed nozzle of type D is displayed at d, while the secondary nozzle j of type G is accessible by removing the slotted plug x x.

Aside from faulty ignition, which is often confounded with carburetor troubles, failure to start may be due to water in the fuel, clogged supply pipe or spraying nozzle, float too low, too much air, etc. Flooding is due to a leaky float, needle valve failing to seat, or float and its mechanism becoming stuck. Too much air is usually denoted by the motor being hard to start and by its speeding up upon closing the air valve, by the engine being slow to respond when opening the throttle, and by back firing. A lack of fuel presents similar symptoms.

Too much gasoline and not enough air is known by the motor speeding up when the air valve is opened slightly, by missing when the car is operating slowly on the level and by failing to pick up when the clutch is disengaged. The last named condition is indicative of a

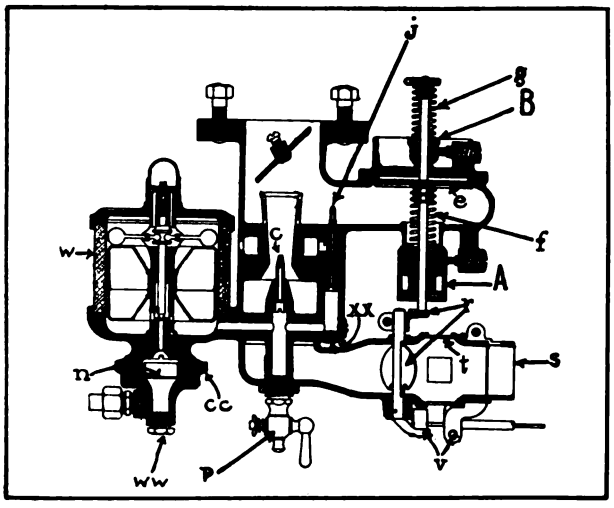

Fig. 4—Adjustment of Type G Is by Nuts A and B for Low and High Speeds and a Dash Control Is Necessary When Fitted with a Hot Air Horn.

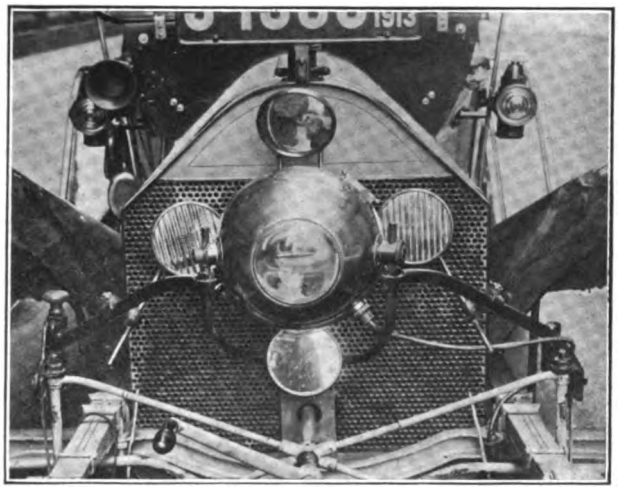
Digitized by Google



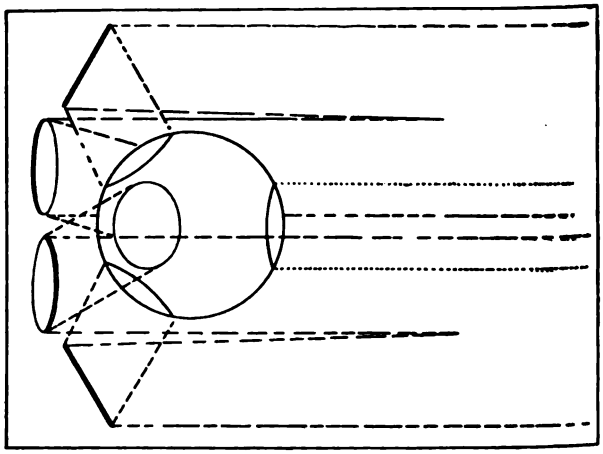
very rich mixture. If, after climbing a long grade, the motor does not respond quickly when the clutch is thrown out, or does not back fire with a rapid opening of the throttle, it may be assumed that there is too much gas or too little air. It should be remembered that warm weather has the effect of not enough air, while cold acts directly opposite.

There are two methods of noting if the mixture be correct, by the odor of the exhaust gases and by their color. If the gases are pungent or acrid, the mixture is too rich, and the fuel supply should be either cut down or the amount of air augmented. Those familiar with the adjusting of carburetors call the exhaust "sweet" when the mixture is correct. Too rich a mixture is denoted by a black smoke, which soots everything with which it comes in contact. The condition of the spark plugs will reveal to a certain extent the proportions of the air and fuel in carburetion. If covered by a black soot it may be taken for granted the mixture is rich, that gasoline is being wasted.

The test by color is by noting the flame from the exhaust through the cut-out. A blue flame denotes too much gasoline; a yellow, too much air; a red, poor quality of fuel or too much oil in the combustion chamber. A purple flame is considered indicative of the best proportions of gasoline and air.

DIVA HEADLIGHT ELIMINATES DAZZLING.

THE efficient headlight is the one that utilizes every ray of its illuminant, and concentrates all its light exactly where it is needed.



Diva Headlight, an Electrical Unit Eliminating Dazzling Effects and Projecting Powerful Parallel Beams Through Novel Use of Reflecting Mirrors.

There should be a certain width of illumination in order to cover the entire surface of the road, and to enable the driver to negotiate corners, as well as proper length and power of beam. But the most important factor to be considered is the dazzling effect and the elimination of this undesirable feature has been given serious attention abroad in headlight designs. Dazzling is caused when the light is projected from a lamp in the form of a cone, the apex of which is the lamp. These upward rays are most noticeable on foggy and misty nights, blinding the operator and making it difficult to drive except at a very slow rate of speed.

George Sumner of George Sumner, Inc., 1926 Broadway, New York City, on his recent trip abroad, made a special study of anti-dazzling lamps and secured the rights in this country for the Diva headlight, an English product, which not only presents interesting constructional features, but eliminates all glaring effects even in a fog. As will be noted by an accompanying illustration it is in the form of a sphere divided in half vertically. The front portion has one double convex lens placed in the centre of its circumference, and the back has four similar lenses, one each at the top and bottom and one at either side.

The interior of the sphere is electroplated, and in the exact centre is an electric bulb, held in position by a column which rises from a base. When the filament is heated the interior of the sphere becomes practically a ball of light, with beams streaming out from it in five different directions through the five lenses. One beam is projected directly forward from the single front lens and the other four at diverging angles from the four lenses in the rear half of the sphere. These beams, because of the dimensions and foci of the lenses, are composed of parallel rays, not those of a diverging or diffusing nature.

Every ray of light which strikes the interior reflecting surface of the sphere is reflected back to the focal centre, travels through it, and passes out of the lens opposite to that particular reflecting surface, at exactly the same angle of diver-

Showing the Searchlight Beams and How Light Is Diffused Sideways by Utilization of Fluted Mirrors.

gence as those rays which proceed direct from the illuminant to the lens. In other words, the reflected rays unite with the direct, doubling the

Digitized by Google

intensity of each lens, making for efficiency.

The parallel or distance and penetration rays, are shown in an accompanying drawing and it will be noted that there are five circular beams but no upward rays. As a certain amount of diffused light is necessary to illuminate each side of the road, it is provided for in the Diva headlight by two special fluted mirrors which not only deflect the beams forward but outward. Thus it will be seen that there are three powerful searchlight beams—the centre lens and top and bottom mirrors—which illuminate the centre of the road, while the fluted mirrors spread their respective beams fanwise on either side.

It is held that dust or mud does not detract from the efficiency of the mirrors as the latter serve only to reflect the light, nor does the Diva impair the efficiency of the radiator as the light is spherical and the mirrors being set at an angle deflect air currents to it. As but one bulb is utilized the headlight is economical of current and makes possible an efficient lighting system with a storage battery as a source of supply. It is mounted, as will be seen by an accompanying illustration, on a gate or bracket, centrally in front of the radiator, and being a unit may be displaced easily and quickly if desired. The method of attachment is simple, the brackets supporting the gate being attached to each side of the chassis and in the majority of installations it is possible to utilize existing bolt holes. The Diva headlight is fitted to a number of high grade cars abroad, particularly in England, where fogs and mist prevail.

HANDLING THE BUICK PRODUCT.

Interesting Figures Which Indicate Business Done by Flint Concern.

The Buick Motor Company, Flint, Mich., maker of Buick cars, gives some interesting figures relative to the traffic department which handles its product. W. H. McCloud is in charge and it is estimated that the system he has worked out is saving the company $100,000 a year. Fifteen thousand cars were handled in the Buick yards during the year, inclusive of the 13 trainloads of Buick machines sent to the West. Outgoing cars numbered 7600 and incoming freight 8000 carloads.

In addition to the freight cars in service there are 22 motor trucks and 10 horse drawn vehicles in constant use. Four switch engines are kept busy all day and two at night, shunting cars and making up trains in the Buick yards. Three transfer cars are kept busy at the motor building for loading during the day, and at night they are rolled up to the dock at the assembly plant.

ESTABLISHES SERVICE STATIONS.

General Electric Company Assists Motorists in Securing Lighting Equipment.

A new departure that is expected to prove of benefit to automobile owners is the establishment of service stations all over the country by the General Electric Company, Schenectady, N. Y., where electric lamps of all types may be obtained readily.

These stations will stock with all types of lamps to suit any particular lighting system with which the car is equipped. Different systems, sometimes, call for a slightly different kind of

Signs Designating General Electric Company's Service Stations or Agents.

bulb and the variety carried by these houses will enable the selection of that which will make for the most efficient and satisfactory service. The signs shown herewith are utilized to indicate either a service station or an agent and should prove of convenience to motorists, resulting in a saving of much valuable time which might otherwise be wasted in searching for an establishment that could fill their needs.

Another example of good service rendered by the General Electric Company is that of putting up electric lamps in a compact, leatherette case. In this there are headlights, side and rear lights, fitting snugly, each lamp in a separate holder. The whole case measures only a few inches overall and takes up little room.

IN THE COMMERCIAL VEHICLE FIELD.

Constructional Features of Stewart Light Delivery Wagon---Text of Maine Statute Limiting Weight of Trucks---Selden One-Ton Design.

PRODUCING only one chassis design, rated at 1500 pounds, to which six types of standard body equipment are fitted, the policy of the Stewart Motor Corporation, Buffalo, N. Y., is to manufacture as high a grade machine as is possible for a price that will appeal to those who desire a thoroughly dependable vehicle. An accompanying illustration presents two of these wagons recently delivered to the Emerson Furniture Company in Brattleboro and Milford, Vt., and indicates the general appearance and characteristics of the line.

The motor is a Continental product, of the four-cylinder, water-cooled, vertical, L head type, with bore of 3.75 inches and stroke of 5.25. Under the S. A. E. rating this would give a horsepower of 22.5, but in view of a bore to stroke ratio of 1:1.40, the statement of the maker that it will develop 30 horsepower may be held to be conservative. Two plunger pumps actuated by an eccentric on the camshaft take the oil from a well in the reservoir, only filtered lubricant being used, and force it through a system of tubing to the rear main bearing and the timing gearcase. Other working parts are lubricated by splash. The water is circulated by centrifugal pump, and the radiator is of the so-called foreign type, being mounted at the dash on helical springs. Ignition is by high-tension magneto with fixed spark, and the carburetor is an automatic float feed type.

The clutch is a multiple disc in which there are 11 plates, five of these being faced on either side with Raybestos. The clutch case is integral with the transmission gearset, the latter being of the Brown-Lipe construction, affording three forward speeds and reverse. The driving shaft is of high quality steel, and there is a universal joint at either end. The rear axle is a Timken of the full floating type, and it is carried in a pressed steel housing that is strengthened by a truss. The housing is reinforced by sleeves at either end, which support the spring seats and carry the weight of the machine and its load at the wheels. The differential gears are of large proportions and are mounted on suitable Timken bearings.

Two Stewart Delivery Wagons, Built for the Emerson Furniture Company, Brattleboro and Milford, Vt.

The front axle is a heavy I section. The frame is a high carbon steel channel section, 4.5 inches deep at the centre and tapered toward either end, with wide webs. This carries the sub-frame in which is mounted the motor and transmission gearset, the supports of these units being designed to facilitate easy removal. Springs are semi-elliptic all around. The wheels are of the artillery type, and are shod with pneumatic tires, 34 by four inches front and 34 by 4.5 in the rear. The wheelbase is 126 inches.

The six standard body designs include panel, express, open box, special express, stake platform and undertaker's installation. The express body is provided with a top, the open box with a

Digitized by Google

cape top and the special express a standing top and wire grating sides.

COMMERCE WITH GAS COMPANY.

Experience of Fort Worth Concern Indicates Better Service at Less Cost.

So well satisfied was the Fort Worth Gas Company, Fort Worth, Tex., with its initial purchase of a Commerce wagon, made by the Commerce Motor Car Company, Detroit, that it added the second vehicle of the same make at the end of three months. The repeat order was not filed until careful observation and accurate record of the work and expense had indicated a substantial saving over former methods of transportation. The first machine, a model C, is shown in an accompanying illustration.

Fort Worth and its suburbs comprise a community with a population of more than 100,000. The work of the company is widely extended and is constantly increasing. The model C was purchased as a result of a demonstration witnessed at the Dallas fair last fall, and was placed in service Nov. 7, replacing a two-horse team and a single horse and wagon. With this installation it was found that the services of two men could be dispensed with. Not only was it found possible to do the same work, but in a much more efficient manner, and the net saving was $91.65 a month. During the period of observation to April 18 the mechanical expense was $3.75, the cost of replacing a fibre ring Feb. 16. The record of the machine shows that it has been driven an average of 37.2 miles each working day at a monthly expense for oil and fuel of $9.50.

The second car is a model A, and this was placed in service Feb. 6. It is equipped with an open express body and placed at the disposal of the service department. Including the men and tools the weight is about 3000 pounds. This wagon has been driven an average of 25 miles a day, the fuel expense being $11.50 a month. The additional weight carried and the fact that it is worked over unpaved streets are assigned as reasons for the greater fuel expense. The two vehicles are doing the work for which five horses were employed formerly.

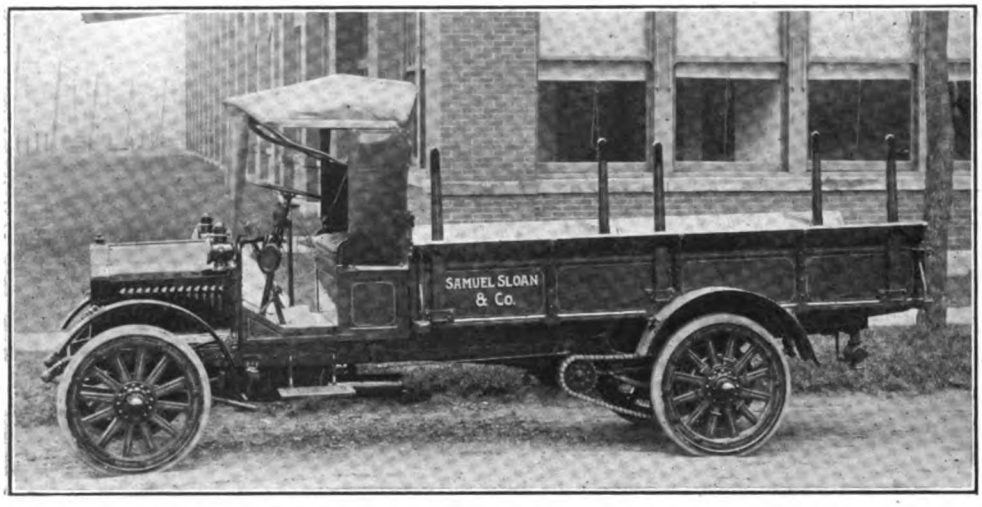
Commerce Model C Wagon in Service with Fort Worth Gas Company.

NEW LAW IN MAINE.

Weight of Vehicles Using Highways Limited to Not More Than Nine Tons.

Although similar bills have been introduced in the legislatures of several states, it appears that thus far Maine is the only commonwealth that has enacted a law limiting the weight of vehicles using the highways. In Massachusetts and New York measures having this object in view were strenuously opposed by organizations of motor truck owners and users. The text of the Maine law, which goes into effect July 11, is as follows:

Sec. 1—No traction engine, trailer, motor car or other vehicle shall be operated upon or over a highway or bridge in this state, nor shall any object be moved over or upon a highway or bridge, upon wheels, rollers or otherwise, in excess of a total weight of nine tons, including vehicle, object or contrivance and load, without first obtaining a permit, mentioned in section three of this act, from the authority or authorities in charge of the maintenance or care of said highway or bridge; nor shall any vehicle be operated or contrivance moved upon or over said highways or bridges which has any flange, rib, clamp or other object attached to its wheels or made a part thereof, which will injure, cut into or destroy the surface of the highway or bridge, nor shall any such engine, vehicle, object or contrivance for moving heavy loads be operated or moved upon or over any highway or bridge the weight of which exceeds 800 pounds upon any inch in width of the tire, roller, wheel or other object without first obtaining said permit. The owner, driver, operator or mover of any such engine, vehicle, object or contrivance over said highway or bridge, shall, unless relieved from liability in said permit, be responsible for all damage which said highway or bridge may sustain as a result of such action on his part, and the amount thereof may be recovered in an action on the case by the city, town or plantation, or in behalf of any unorganized township, by the county where the injury is done.



Sec. 2—No steam traction engine, with or without

Digitized by Google

trailers, and no motor truck carrying a weight in excess of four tons, including the vehicle, shall be operated upon any highway or bridge at a rate of speed greater than 15 miles an hour; and no such vehicle carrying a weight in excess of six tons, including the vehicle, shall be operated upon any highway or bridge at a rate of speed greater than six miles an hour when such vehicle is equipped with tires of hard rubber or other similar substance.

Sec. 3—The Maine highway board, county commissioners, superintendents of streets, selectmen or road authorities having charge of the repair and maintenance of any highway or bridge in any of the cities or towns in the state, are hereby authorized, upon proper application in writing, to grant permits for the moving of heavy vehicles, loads, objects or structures over said highways and bridges, which permits, when duly granted, shall authorize such movement. Said permits may be general or may be limited as to the time and the particular roads and bridges which may be used, and may contain any special conditions or provisions which in the opinion of the authorities granting the same are necessary for the protection of said highways and bridges from injury. The authorities having charge of any such bridge are hereby authorized to make regulations limiting the rate of speed of any of the vehicles mentioned in this act passing over said bridge to a rate of speed not to exceed six miles an hour, provided notice is conspicuously posted at each end of the bridge affected by such regulation.

Sec. 4—Any person violating the provisions of this act or the regulations made or permits granted under authority thereof shall be liable to a fine of not less than $10 nor more than $500 for each and every offense, and said fines shall be paid into the treasury of the city or town when a highway or bridge is injured which is under the care of said city or town, and into the treasury of the county, in behalf of any unorganized township to be used in the repair of highways and bridges within their respective jurisdictions.

Selden One-Ton Truck in Service with Samuel Sloane & Co., Rochester, N. Y.

SELDEN ONE-TON TRUCK.

Features of Construction Which Mark This Product of the Rochester Concern.

An accompanying illustration presents a Selden one-ton delivery wagon in service with Samuel Sloane & Co., Rochester, N. Y., a large dealer in supplies for plumbers and steam fitters. It serves to indicate the characteristics of this product of the Selden company, although the body was designed and constructed to meet the special needs of the purchaser, being heavily ironed inside to protect it against damage and excessive wear due to the handling of large iron pipe and other similar materials.

The motor is a four-cylinder, water-cooled, vertical unit of the L head type, with bore of 3.75 inches and stroke of 5.25, giving a rating of 22.5 horsepower under the S. A. E. formula, although it is stated that it will develop considerable in excess of this. Lubrication is by a force feed constant level system. Ignition is by high-tension magneto, and the carburetor is of the automatic float feed type. The speed is governed to 16 miles an hour, at which a motor speed of 1150 revolutions is obtained.

The power plant is a unit construction, in which the flywheel, clutch and transmission are enclosed. The clutch is of the multiple disc type with 13 steel discs, six of which are faced on either side with Raybestos. The transmission is of the selective type, giving three forward speeds and reverse. The entire assembly is mounted on a subframe which protects it against the strains of chassis distortion.

Drive is by a driving shaft with a universal joint at the forward end to a jackshaft of the semi-floating type mounted in high duty roller bearings. The differential and driving gears are heavy and have an adjustment by a nut back of thrust bearing. Final drive is by side chains. The service brake is with internal expanding shoes operating within 10-inch drums on the jackshaft, while the emergency brake shoes operate within 16-inch drums on the rear wheels. The frame is of steel channel section with wide webs. The front axle is an I section and the rear a rectangular forging, both being of heavy construction and heat treated. Springs are semi-elliptic all around. The wheels are shod with 36 by 3.5-inch tires in front and 36 by four in the rear. The wheelbase is either 125 or 145 inches, and bodies are stocked to meet the requirements of purchasers in different sizes suited to the two lengths of chassis.

Digitized by Google

The Selden plan of selling machines is a departure from what may be regarded as standard practise in that the Selden Truck Sales Company was organized to provide the necessary financial resources to sell the vehicles on a time payment plan. This policy has opened a very large field, making it possible for merchants and manufacturers to own machines without being compelled to carry the financial burden that would be entailed by the immediate change from one type of delivery to another. Under the Selden plan the purchaser is given a year in which to pay for the vehicle.

MEMORIALIZE THE LEGISLATURE.

Electric Convention Asks That Motor Truck Bill Be Defeated.

The matter of taxing motor trucks by increasing the registration fees was discussed fully before the convention of interests allied with the production and use of electrical energy in Boston last month, and besides calling the subject directly to the attention of the public the following resolutions were referred to the Massachusetts legislature:

At a joint convention of the New England section of the Electric Vehicle Association of America, the Electric Motor Car Club of Boston and the electric light companies of Massachusetts, representing a total membership of 798, employing over 18,000 men, it was unanimously

Resolved—That the passage of any bill arbitrarily increasing the registration fees on motor trucks would be injurious to the industry as a whole, would tend to retard the industrial development of natural resources and the manufacturing growth of this state, and would seriously restrict commercial progress. Such action would be contrary to the traditional spirit of progress which has always distinguished this commonwealth and its Great and General Court.

And Be It Further Resolved—That such a discriminating tax would be an unfair burden upon a growing industry which is assisting to promote commerce and improve fundamental conditions in the commonwealth's industrial life.

Resolved—Should it be found necessary to secure additional funds for building and preserving the state highways, that a scientific investigation of actual traffic conditions should be made, which we believe would show that horse drawn wagons and trucks tend to destroy the highways by reason of the sharp steel shoes of the horses and the narrow steel tires to a much greater degree than the broad yielding tires of the motor truck, and that fees should be proportionately charged on all vehicles using the highways.

HISTORY OF THE INDUSTRY.

When It Is Compiled It Will Show Effect on Business in General.

According to William C. Poertner, the well known National dealer of Brooklyn, N. Y., the growth of the motor car has been so fast that it has been next to impossible to keep pace with its advancement from year to year. In practically 15 years the motor car business has developed into one of the largest industries in the world, employing thousands of men and opening up channels for skilled labor never before dreamed of. Mr. Poertner believes, in view of these things, that an authentic history of the industry should be presented. He says:

Today the automobile monopolizes the public roadway and is as much a part of our daily life as the telephone, typewriter, telegraph or street car, and attracts as little attention as the ownership of an umbrella. But to anyone except those directly responsible for the automobile and its advancement little or nothing is known or appreciated of the vastness of the industry and what its development has meant to the welfare of the country at large. When the first edition of "The History of the American Industry" is off the presses no little space must be devoted to the fortunes spent annually in the production of automobiles in this country. If the writer will carefully collect his material he will surprise the country with facts relating to the effect of the motor car's growth on business in general.

FUEL PROBLEM IS SOLVED.

At Least That Is the Opinion of Some Planhard Carburetor Users.

That the fuel question is being solved to the satisfaction of some people is evident from their own testimony. In this connection the Planhard Manufacturing Company, 1790 Broadway, New York City, presents interesting statements by two manufacturers of motors. President H. G. Latimer of the McDowell-Latimer Company, Mystic, Conn., maker of the Latimac motor, says:

The Latimac motor and the Planhard carburetor certainly make a great combination. One of our four by five-inch motors in use in a commercial fishing boat averages less than five gallons of fuel a day of 10 hours—on low grade gasoline at that. Our motor has an almost unbelievable range of flexibility, never back fires, starts hot or cold and is not affected by fog or other weather conditions. This boat is owned by Henry M. Hoxie of Mystic, and is leased to a commercial fisherman who uses it every day. It is 22 feet six inches in length by eight feet six inches beam and weighs three tons. We equip all our motors with Planhards because of their great economy, simplicity, ease of adjustment and all around efficiency. I expect some may doubt my statement, but they can go to the boat for proof.

Frank Burtt, president of the Burtt Manufacturing Company, Kalamazoo, Mich., maker of stationary gasoline engines, discusses the subject as follows:

We have been using Planhard carburetors for some time and have adopted them as exclusive equipment because we are more than pleased with their performance. We find in comparative technical tests and in actual service that the Planhard is without a peer in handling fuel of low and high grades. Our motors start hot or cold without priming, and we always obtain the same mixture the carburetors are set for. But the qualities which attract us most are their ability to enable the motor to deliver great power, and unusual economy in fuel consumption. We have placed a great many of these carburetors on our engines and have yet to hear the first complaint.

REPORTING AUTOMOBILE ACCIDENTS.

Massachusetts is to try a new experiment in its efforts to curb reckless driving. Under the terms of the statute every operator of a motor vehicle is required to report every accident in which any person or property is injured, under penalty of endangering his license. On its face the law would appear to carry the matter one step further than the requirements in other commonwealths; that is, instead of being admonished to stop and make known his name and address, the motorist is expected to make report to the state highway commission. The original bill was somewhat more drastic, the legislators having eliminated the clause, "with a full report thereof," fearing that it would prove unconstitutional, inasmuch as no person can be compelled to give evidence against himself.

The proof of the statute is in the enforcement thereof. If it is impossible for the local constabulary to secure the number of the fleeing machine, much less the name and address of the driver, how much more simple is it going to be to apprehend the operator who fails to report an accident? Inasmuch as a large majority of motorists are law abiding citizens, it may be forecasted that this percentage will conscientiously report all accidents in which they are involved, but those individuals who have given abundant evidence of their lack of consideration for the rights of others using the highways, including fellow motorists, may be expected to escape as easily as heretofore.

Ordinarily, when a concern finds it necessary to erect additions to its plant and increase its capital to take care of production, there is reason for believing that business is good. Basing the assumption on this premise it would appear that the automobile industry was experiencing little difficulty in maintaining its customary growth, despite conditions which were expected by some economists to result otherwise.

The aeroplane must be regarded as having established its practicability. It doesn't matter so much that world's records have been exceeded almost as fast as created, nor yet that a Chicago business man has acquired a machine to use in flying between his summer home and his office. The really important fact is that it can be registered by the state highway department, the license fee going toward the expenses of the commonwealth. It hardly can be maintained, however, that aeroplanes injure the highways to any material extent.

The kerosene car has arrived and the maker who offers this type of carburetor appears to have every faith in its possibilities. Two of these machines are to take part in the transcontinental tour of the Indiana Manufacturers' Association, and if the itinerary selected by the committee is followed in detail, most motorists will be satisfield with the test imposed. The proposed route includes some of the best roads in the country, only recently constructed, but it also includes some of the worst. The tour ought to prove one of the most interesting reliability events of the season, at least in America.

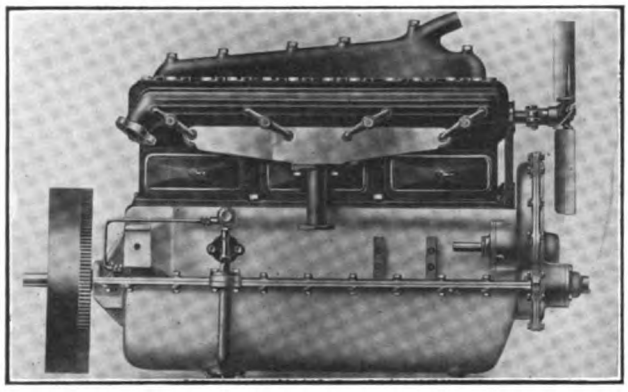
HENDERSON OFFERS BI-FUEL CARBURETOR.

TWO new chassis, a De Luxe four-cylinder and a six, have been added to the Henderson line, manufactured by the Henderson Motor Car Company, Indianapolis, Ind. These two and a light four-cylinder car will constitute the 1914 series of the company which announces that all of the models are now in the hands of its distributors and agents. The new chassis will be fitted with five-passenger touring, roadster, Sedan and coupe bodies, while the light four is furnished only as a five-passenger touring car. The equipment of all models is very complete and every convenience for operation is provided, including electric lighting and electric motor starting.

The progressiveness of the Henderson company is noted in giving the purchaser option of a Harroun bi-fuel or a Rayfield carburetor. With the former, either gasoline or kerosene may be utilized independently and provision is made for adjustment from the seat. In adopting the Harroun the company believes that the motorist should be provided with means for using either fuel and points out that it is but anticipating the demand of many prospective buyers for a carburetor adapted to kerosene. The selection was made after a series of exhaustive tests which demonstrated the practicability and efficiency of the new vaporizer. As kerosene is easily obtained and its cost is considerably less than gasoline, a bi-fuel carburetor presents practical advantages. The company will equip its entries in the Indiana-Pacific tour this summer with the Harroun product.

The Henderson company claims to have been the first concern in America to list wire wheels as regular equipment, optional with wood members, and the success of its 1913 models utilizing these wheels has led it to offer the same option in the new series. The McCue product is utilized and is provided with a quick detachable ring in addition to its demountable feature, making possible the changing of tires without displacing the wheel. When the wire wheel is selected one extra wheel is standard equipment. All wood wheels are fitted with demountable rims, and one extra member is included in the equipment.

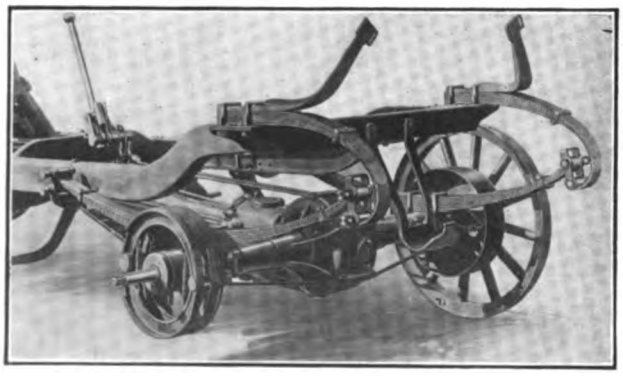


The Henderson Line for 1914 Has Been Augmented by the Addition of a De Luxe Four-Cylinder and a Six-Cylinder Chassis to Which Will Be Fitted Four Types of Bodies—A Light Four-Cylinder Car Also Is Marketed and the Equipment of All Models Is Very Complete.

Although many refinements are noticeable in the new chassis, the same mechanical features that made for the stability of the Henderson product during the past year have been retained. Except for a difference in the horsepower production and the strengthening of those components caring for the transmission of greater energy, the chassis are identical.

All motors are of the L head type, with enclosed valves, and a noteworthy feature is the high grade finish of the exterior components of the power plant, all mountings such as the water manifolds, breather tubes and the tube which car-

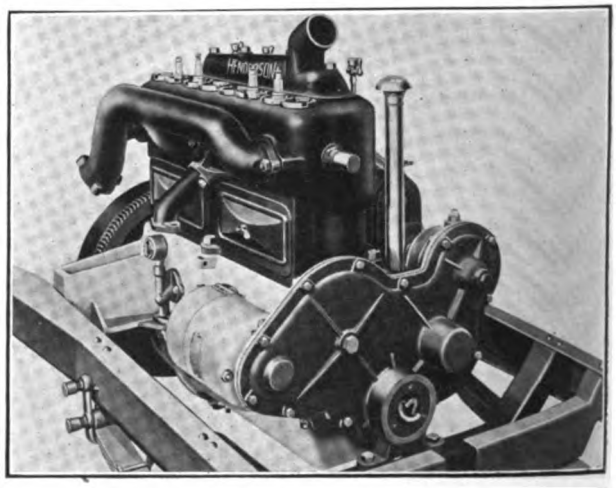
Digitized by Google



New Six-Cylinder Henderson Motor, Presenting Clean Lines and Compact Construction—The Design of the Intake Manifold Should Make for Efficient Carburetion.

ries the high-tension wires being nickel plated.

The cylinders are cast en bloc, very compact and all components are readily accessible. The power plant is supported by arms at the rear, these being cast integral with the upper crankcase and liberal in size. The third point of suspension is by a large trunnion mounted above a cross member of the frame. The timing gears and those driving the lighting generator and magneto are accessible through a large housing. A notable feature is the very short intake manifold, one free from bends. That utilized on the six-cylinder motor is particularly well designed, in that its proximity to the exhaust manifold precludes the possibility of condensation of the gas and makes for easy starting as well.



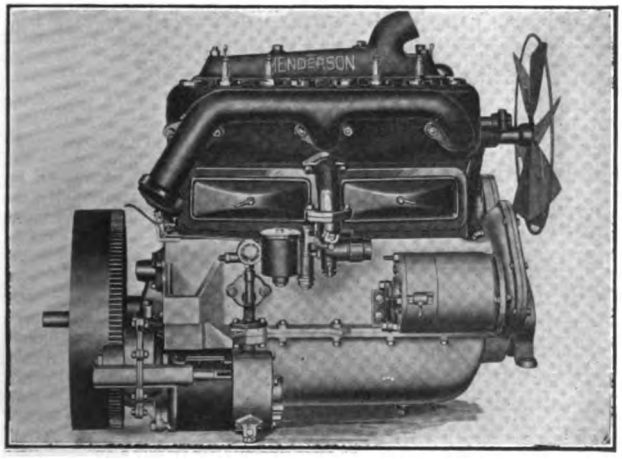
The De Luxe motor has a bore of 4.125 inches and a stroke of 5.5, a slightly longer stroke than the light four, which is 5.25 inches. The company's rating of the De Luxe is 46 horsepower, and that of the other model 44. The six-cylinder motor has a bore of 3.75 inches and stroke of 5.5, which places it in the long stroke class, and although the rating by the S. A. E. formula is 33.75, the company states that it has developed as high as 54 horsepower in block tests.

Showing Sturdy Rear Construction, Large Springs, Centre Control Lever and Liberal Sized Brakes.

The lighting generator and motor starter are separate units, manufactured by the Ward Leonard Electric Company, Bronxville, N. Y. The Eisemann dual magneto is standard on all motors. Cooling is by thermo-syphon with large intake and outlet manifolds which with the oversize honeycomb radiator assure proper temperatures under the severest service.

The clutch is a cone and the transmission is of the selective type providing the conventional three forward speeds and a reverse. The gearbox is located on the Stutz rear axle, making for accessibility and preventing the transmission of noises when operating on low ratios. Centre control and left hand drive are continued and the company claims that its control is not duplicated in any other car. The lever is placed between the cushions of the front seat and instead of the conventional H gate being employed in a horizontal plane, it is mounted vertically. The lever moves up and down and forward and back in a very short radius, and the second and third speed slots are located at the bottom and have the shortest movement.

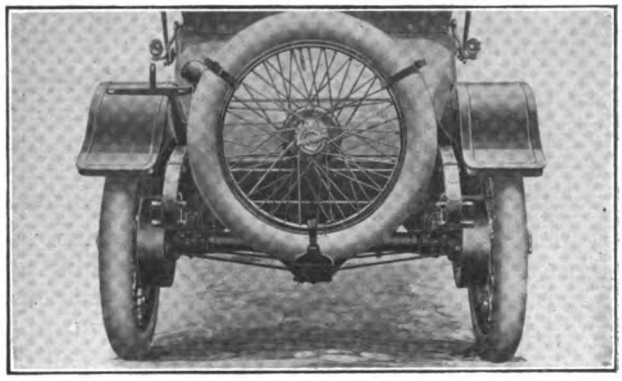
Illustrating Three Point Suspension of Henderson Motors—Note Heavy Trunnion Mounted on Cross Member in Front and Substantial Rear Arms.



The usual emergency brake lever is eliminated by the Henderson method of control, the left pedal serving for the clutch and service brake while the right actuates the emergency members. The emergency brake pedal is fitted with a ratchet, and catches in the toeboard enable the driver to set the brakes without removing his hands from the steering wheel. Both sets of brakes are of the internal expanding type, liberal in size and provided with equalizers. These and the adjusting mechanism are located under the floorboard and forward of the front seats.

Digitized by Google

The frame is provided with the usual kickup at the rear, making for a low centre of gravity, and to the rear cross member are bolted securely the tire carrier and spare wheel support. The spring suspension is the same as in former Henderson models, 38-inch semi-elliptic members being utilized in front and 50-inch three-quarter elliptic in the rear.

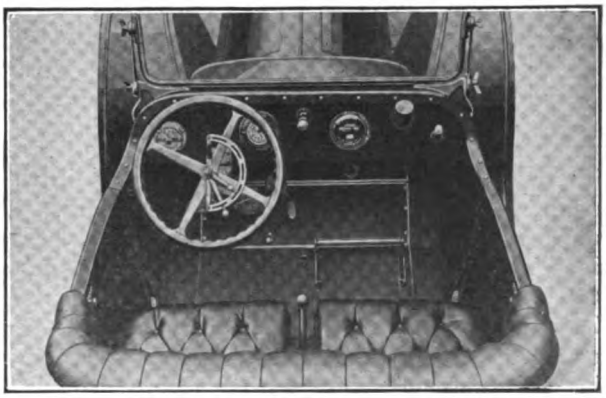


All Henderson models are over tired, making for greater mileage and easier riding qualities. Thirty-five by 4.5-inch Goodyear straight side shoes are fitted to all wheels on all models. The fuel tank in the dash cowl, which attracted attention to the Henderson line last season, is continued.

Throughout the models are noteworthy for their clean and attractive appearance. The running boards are free from obstructions and the dash instruments are mounted flush. All are

Right Hand Side of Four-Cylinder Motor, Showing Installation of Electric Lighting and Motor Starting Units.

heavily nickel plated and include from left to right: Magneto switch, eight-day clock, dash lamp, speedometer, fuel tank filler and carburetor adjustment. The clock and speedometer are of the same size and the dials are black with white characters, making for easy reading at night. The switch controlling the various groups of electric lights is placed back of the control lever, a position making for convenience. Another new feature is the position of the button controlling the electric horn. It is inserted in the top of the steering column just above the pivot of the spark and throttle levers. The design not only simplifies the control, but eliminates the usual cord and switch on the wheel rim or spider. All levers, pedals, etc., are nickel plated and this finish prevails throughout. The steering wheel on both the six-cylinder and De Luxe models is corru-



Method of Carrying Spare Wire Wheel—Note the Henderson Number Bracket, Which Is Protected from Mud and Properly Illuminated.

gated, the column being at a comfortable angle.

The one-piece universal windshield, a feature of the 1913 line, is retained, and it may be so adjusted that it will ventilate the front compartment or lowered to afford the operator a clear vision of the road. A rubber skirt on the bottom of the shield prevents rain from being blown under it. All models are provided with nickel plated foot rails and the touring bodies are equipped with robe rails. The battery box is placed under the right hand front seat and the tools are stored under the left seat.

The upholstery of the touring and roadster models is a high grade machine buffed leather with Turkish effect. The cushions and backs are deep and all touring cars are furnished with a genuine leather kick pad. The coupe and Sedan bodies will be upholstered in gray whipcord. The tops are of genuine silk mohair and come complete with dust envelopes and curtains to match. The standard colors are dark olive and gray, at option of the purchaser. The wheelbase for both the De Luxe and light four chassis is 116 inches and that of the larger model is 126 inches.

WITH THE MOTORING INTERESTS ABROAD.

Vauxhall Cars Show Up Well in Foreign Contest Work---Sunbeam Creates New Records When Using Benzol as Fuel---Studebaker Secures Gold Medal.

INTEREST in foreign racing machines has been increased somewhat by the performance of those which took part in the recent 500-mile international sweepstakes race at Indianapolis. Only one of these was of English make—the first to be seen in a contest in America, at least in recent years. Herewith is presented an illustration of another specially designed British racer, this being the Vauxhall, driven by A. J. Hancock, to lower the existing 50-mile record on the Brooklands track, Weybridge, England.

Although the car shown was designed for high speed the standard product of the Vauxhall Motors, Ltd., Luton, Bedford, has been particularly successful in contest work, not only in Great Britain and on the Continent, but especially in the colonies. A Vauxhall won the sweepstakes prize in the reliability trials in New Zealand last month, and more recently in the Australian interstate contest cars of this make finished in third and fourth place, being defeated in points for fuel consumption and hill climbing by two Talbot machines.

This last named contest was between motorists residing in the two most populous Australian states, Victoria and New South Wales. The route covered 570 miles and four days were devoted to the trials. Two American machines competed, the entire list of entries numbering 20. R. G. Carey drove a Ford and Miss H. Monk a Cadillac.

CREATES RECORDS ON BENZOL.

Sunbeam Car Sets New Marks with This Fuel on Brooklands Track.

While as a rule attempts at reducing class records in Great Britain do not have the same interest for Americans as similar events in this country, because the rating is not the same, the performance of a Sunbeam, with bore of 3.14 inches and stroke of 4.72, on the Brooklands track, Weybridge, is particularly worthy of note, because the fuel utilized was benzol. The records held by cars using gasoline were exceeded in both instances.

In the time trial for one-half mile, flying start, T. Hearne was at the wheel. The time was 0:20.7 as against the former mark of 0:23.81, held by a Humber, the respective speeds being 86.96 and 73.6 miles an hour. The second trial was for 10 laps, L. Coatalen driving. The distance was covered at a speed of 82.55 as compared with 72.46 with the Crossley, which previously held the record. A further comparison may be made when it is known that the Humber was with bore of 2.95 inches and stroke of 5.11. The Crossley had a bore of 3.12 inches and stroke of 4.86.

THE PRAGUE EXHIBITION.

Complaint That American Producers Failed to Assist Agents to Make Display.

The annual automobile exhibition at Prague, Austria, was held recently at Prague exhibition grounds and the opening exercises were attended by the local officials and foreign consuls. The number of cars exhibited was greater and the quality better than at the exhibition of 1912, especially those of American make, 10 of which were shown. The American manufacturers were severely indicted by the Prague and other Austrian agents for their lack of support, in comparison with that which other European makers accorded to their representatives.

One agent stated to Consul Joseph I. Brittain of Prague that he was obliged to pay upward of $400 from his own pocket in connection with an exhibit of four cars, while it is claimed that German manufacturers granted special subsidies to agents exhibiting their machines; in fact, practically defrayed the expenses connected with the exhibits. The American agents say they must fight their battles with their competitors alone.

The leading foreign cars displayed were: Benz, Opel, Renault, Mercedes, Hupmobile, Ford, Presto, Studebaker, Windhof, Minerva, Berliet, La Buire and Mathis. The Austrian machines shown were those made by Laurin & Klement of Jungbunzlau, Bohemia; the Praha, made by Bohmisch-Mahrische Machinen Fabrik, Lieben, a suburb of Prague; Josef Walter, Smichow, another suburb; Johann Puch, Gratz, Austria; W. A. F., Wiener Automobil Fabrik, Vienna; R. A. F., Reichenberg, Bohemia; Premier, Eger, Bohemia; Alois Nejedly, Koniggratz,

Bohemia, and Austrian Daimler, Wiener Neustadt.

PARIS OBJECTS TO MOTORS.

Gasoline Machines Not Permitted on Fashionable Thoroughfare at Noon.

Paris, first of all the cities of the world to welcome the automobile, has also been the first to banish it from fashionable thoroughfares. A law recently went into effect forbidding any kind of gasoline car to put in an appearance upon the most exclusive drive in the city, the Avenue des Accacias, between the hours of 11 in the morning and 1 in the afternoon, the smartest period in all the 24 hours of the day.

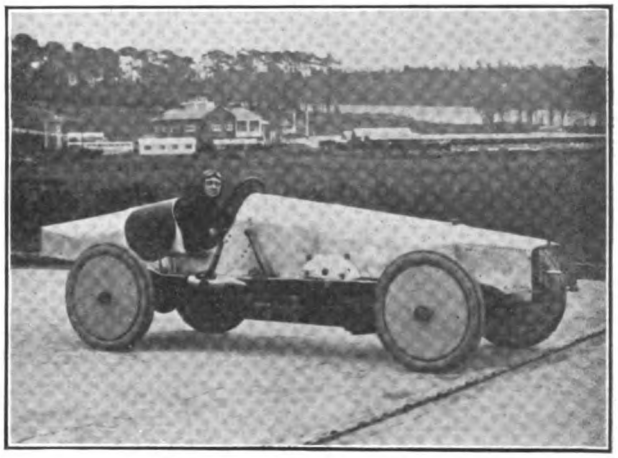
For the first time in many months old time equipages were to be seen in the drives, most of them being Victorias. It is understood that the motive of the authorities in issuing the order was to revive the splendors of the second Empire, when the Bois was one of the show places of the world.

LONDON-EDINBURGH RUN.

Studebaker Entrant Was Successful in Qualifying for a Gold Medal.

This year's London-Edinburgh run, which has come to be a popular annual event, took the form of a celebration of the 10th anniversary of its founding. The start was from Highgate, the route being along the Great North road by way of Barnet, Hatfield, Welwyn, Baldock, Biggleswad, Buckden, Stilton, Stamford, Grantham, Doncaster, Ferrybridge, Tadcaster and York. At this point the route was changed to include places not included heretofore.

The following are the cars which finished, thus qualifying for a gold medal: Charles Jarrott, official car, Crossley; J. Van Hooydonk, Phoenix; Dr. E. W. Brewreton, Metallurgique; Barnard R. Banks, Albruna; F. W. Turner, Benz; F. C. Westall, Gregoire; A. J. Sproston, Studebaker; E. Birch-Reynardson, Beeston Humber; W. R. Norris, Morris-Oxford; A. Bray, Foy Steele; W. Whittall, Argyll.



NOTES FROM FOREIGN LANDS.

In order to still further stimulate the activity of manufacturers of rubber goods in establishing factories in Brazil, the Brazilian government has fixed a customs duty of 65 per cent. ad valorem on all rubber articles. This is part of the government's project for discouraging the importation of "things that might just as well be manufactured in the Amazon valley."

The composition, geographically and otherwise, of the new council of the Scottish Motor Trades Association has evoked general satisfaction. The districts, as well as the various branches of the industry, are proportionately represented. J. S. Matthew, managing director of Argylls, Ltd., Alexandria, Scotland, has been appointed chairman, and W. L. Sleigh, managing director of Rossleigh, Ltd., vice chairman, for the current year. The election was unanimous, a fact which augurs well for a successful year's work.

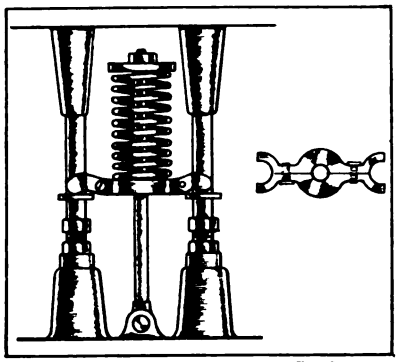
There should be a good market at Plauen, Germany, for American motor cars if they are properly introduced. The roads are in excellent condition during the entire year. There are many manufacturers in that vicinity who are wealthy and well able to afford and maintain motor vehicles. Approximately 100 to 150 motor cars and trucks are sold yearly in the Plauen district and the demand for motor trucks is increasing. A 30 horsepower touring car selling for $1000 to $1200, with attractive appearance and finish, would no doubt find a good market if represented by a good active agent. It is also essential to have a repair shop well equipped, with duplicate parts to insure immediate repairs.

Although the day was rainy, the annual hill climb of the Lancashire Automobile Club, which recently took place in England, was a success and a large number of entries participated. The competition was divided into two closed classes for amateurs, a cyclecar class and four open classes. F. Stansfield, driving a Stoewer, won the silver cup presented by G. E. Baxter in the closed class

A. J. Hancock at Wheel of Vauxhall Racing Car on Brooklands Track, Weybridge, England.

for four-seated vehicles, while H. P. Forshaw's two-seated Stoewer won in its class. In the open cyclecar class the winner was G. W. Hands in a Calthorpe. The winner of the open event was J. Higginson, driving a Vauxhall. Four silver cups were given for the cars making the best performance on formula in their respective sections, as follows: W. Greenwood, Stoewer; W. M. Letts, Crossley; A. Fillingham, Vauxhall; L. Coatalen, Sunbeam.

German motor vehicle manufacturers report that 1912 was an entirely favorable year for them. It brought an expansion surpassing even in percentage that of 1911. According to official provisional statistics now available, the foreign trade increased from $14,268,000 to $21,347,000 in the course of the year, and reports of the home trade, although not yet in statistical form, indicate as favorable a situation. The greater part of the growth in foreign trade is accounted for by increased exportation, especially passenger vehicles. In 1911 Germany exported 5154 machines of this type, worth $10,099,000, and in 1912, 7948, worth $15,473,000.



Few South American cities, in proportion to the number of inhabitants, show as many automobiles in use as Montevideo, and they are increasing very considerably. During December and January no less than 115 high priced cars entered that port and were sold. There are now more than 1300 machines licensed in Montevideo, about 2000 being the total for the whole republic. Machines of American manufacture are well represented.

THE REPAIR SHOP AND GARAGE.

A Simple and Easily Made Jig for Replacing Clutch Springs---Equalizing Valve Springs---Loss in Watts Due to Small Wire.

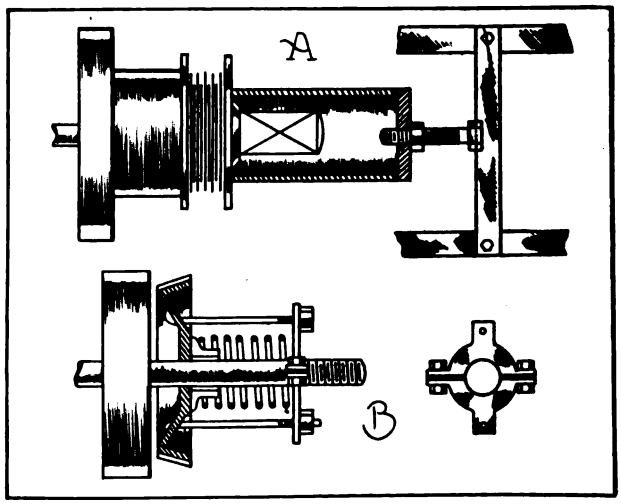
REPLACING clutch springs sometimes means damaged hands unless the workman is careful and has the proper tools for the work. A simple and easily constructed jig for replacing multiple disc types is shown at A in an accompanying illustration. It comprises a tube of sufficient inside diameter to slip over the shaft and a plate equal in diameter to that of the tube. The plate is drilled to take a .625-inch bolt which is fitted with a nut. The head of the bolt is cut as shown so that it will not slip when the nut is being screwed up. The jig shown at B differs from the one described in that it is applicable for cone type of clutches, and as will be noted, the plate member is made in two pieces or halved, so that it may be removed easily.

Suggestion for a Valve Spring.

EQUALIZING VALVE SPRINGS.

A suggestion for equalizing or balancing the tension of valve springs and one which is of interest in that one member may be utilized in place of two, is given in a recent number of the Commercial Motor, an English publication. It is designed to be employed with four-cylinder motors, but could be utilized on other types by making the actuating parts conform to the engine.

As will be noted by the accompanying illustration a vertical rod is fitted centrally between the valve guides, two lugs being secured to the upper surface of the crankcase for the purpose of hinging or pivoting the rod member and to permit canting of the crossbar.



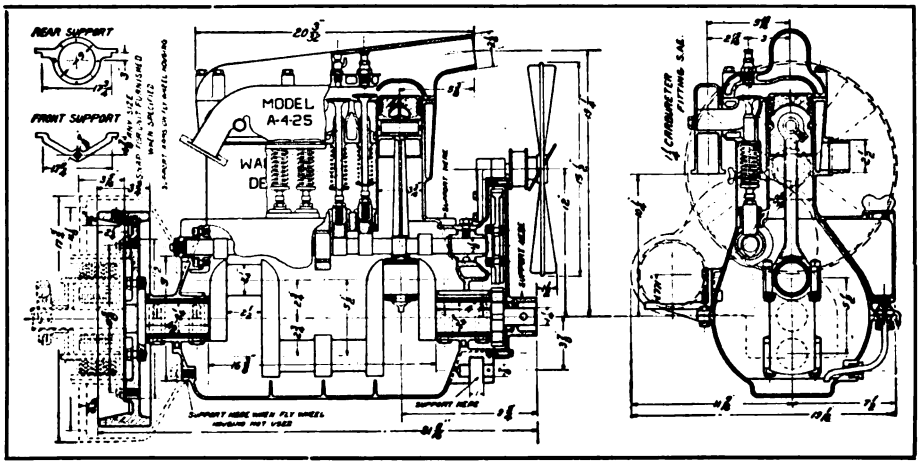
The valve spring is carried by a crossbar which is construced as shown in the sketch, and is provided with slotted ends which fit over and control both tappet spindles. As constructed the tension of the spring could be increased if desired and the device presents an additional advantage in that it would simplify the work of grinding valves as it would be an easy matter to remove the spring. Presumably the valve stem is relieved from undue side thrust by suitably proportioning the crossbar.

PROPER WIRE FOR LIGHTING.

Proper consideration should be given to the size of wires utilized in the installation of electric lighting outfits, or in replacing damaged leads. Too small a gauge results in deficiency, according to Emil Grossman, electrical expert. In experiments conducted with 12-foot duplex lengths of No. 16, 12 and 10 B & S gauge sizes of wires and used to supply 10 candlepower, six-volt, 12.5-watt tungsten lamps with current, the percentages of loss were as follows: On a basis of a No. 10 wire line the loss in the No. 12 size is 1.58 times; in a No. 14 size, 2.25 times; in a No. 16 size, four times—the least that would occur in a No. 10 wire size.

Size wire	Resistance in ohms a 12-foot length of line	Loss in watts	Ratio
No. 10	0.024	0.102	1.00
No. 12	0.036	0.165	1.58
No. 14	0.060	0.230	2.25
No. 16	0.096	0.360	4.00

The accompanying table shows the resistance in ohms and loss in watts and ratio. A line is considered as having two wires.



Jig for Replacing Clutch Springs: A, Type Applicable for Multiple Disc; B, Showing Application to Cone Clutch.

DETAILS OF THE WARNER-DETROIT MOTOR.

H. L. WARNER, well known to the automobile industry as the founder of the Warner Gear Company and the Muncie Gear Works of Muncie, Ind., has designed a new motor which will be known as the Warner-Detroit, model A-4-25, and which will be manufactured by the Warner-Detroit Motor Works, Detroit. The new concern plans to build 15,000 motors during the next 18 months and announces that about Aug. 1 it will market a six-cylinder engine of substantially the same design as the A-4-25, also a suitable sliding gear transmission with multiple disc clutch and levers for both types.

The designs are to be made both for unit power plant and sub-frame construction. They will be built to carry any standard sliding gear transmission and will be furnished complete with either planetary or sliding gearsets, adapting them to pleasure or commercial car service. The A-4-25 model is designed to withstand severe and continuous service and is very compact, as will be noted by the dimensions in the sectional drawings presented herewith. Provision is made for the installation of electric lighting generator, motor starter and magneto by suitable brackets.

Sectional Drawings of Warner-Detroit Model A-4-25 Motor Having Long Stroke and Well Proportioned Components.

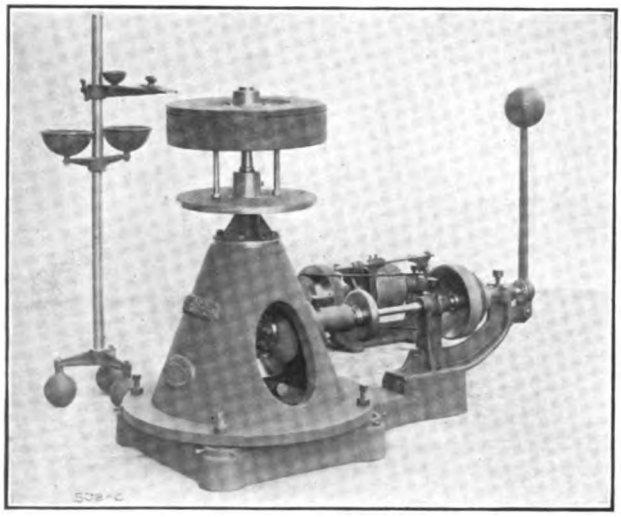
The most striking feature of the Warner design is the bore and stroke, these being 3.1875 by 5.5 inches, a bore to stroke ratio of 1:1.72, exceeding by .07 that of a well known car having a bore and stroke of 4.25 by seven inches. The components of the power plant are well proportioned, the bearings liberal in size, and throughout attention has been paid to those details making for accessibility as well as economical maintenance.

Although rated at 16.2 horsepower by the S. A. E. formula, it should develop double this rating, a contention that is borne out in practise by motors having approximately the same bore and stroke. The four cylinders are of the L head type, cast integral with the upper crankcase, and removable heads provide easy access for grinding valves and removing carbon deposits. The cylinders and pistons are of semi-cast steel and the latter members are provided with three rings above and one which is in line with the wristpin.

The crankshaft is of 3.5 per cent. nickel steel, heat treated, 2.5 inches in diameter with two bearings, four and 4.5 inches long. The camshaft diameter is 1.125 inches, width of cams one inch, and that of gears .875 inch. The timing gears are accessible through a removable cover. The magneto or timer shaft is one inch in diameter. The connecting rods are drop forged and have a crankpin bearing of 2.5 inches. The cast iron valves are electrically welded to steel stems and have a liberal opening. The valves are enclosed by easily detached covers.

Cooling is by the thermo-syphon system, the diameter of the water piping being very liberal, insuring proper temperature under all conditions of service. Lubrication is by splash, an adaptation of the water bottle principle being employed to maintain the proper height of oil in the crankcase.

The flywheel is machined to fit either cone or multiple disc clutch. The rear end of the motor is designed to receive the bell housing of any transmission connection enclosing the flywheel, or cross members for main or sub-frame construction, providing for three or four point suspension.



The Warner-Detroit Motor Works has offices at 1615 Dime Bank building, Detroit, and is financed by several prominent business men. William H. Downes, formerly of the Chas. A. Strellinger Company, is secretary, and William H. Lonsdale, for several years superintendent of the Knox Automobile Company of Springfield, Mass., is general superintendent. H. L. Warner is manager.

GARAGE AND REPAIR SHOP EQUIPMENT.

THE proper balancing of motor flywheels and other similar rotating parts, and the elimination of undue vibration are important factors in motor construction. An engine will not run in an entirely satisfactory manner unless its flywheel is given both a running and standing balance. The old methods of balancing weights give only a static balance; that is, the rotating parts would be balanced perfectly standing still, but they would not always be in balance when running. High speed parts are so designed and balanced that they will not distort from centrifugal action if rotated free at any speed at which they may run in use, and thus destroy a state of running balance.

The Defiance Machine Works, Defiance, O., has made a study of this particular branch of the

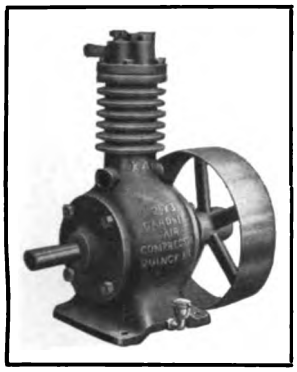
Defiance Patent Motor Flywheel Balancing Machine.

automobile industry, and in an accompanying illustration is presented the Defiance No. 66 patent motor flywheel balancing machine, which is designed to give a flywheel or similar rotating part not to exceed 1000 pounds in weight, a perfect running and standing balance. Special effort has been made to eliminate complicated parts without dispensing with such essential features as are necessary to accomplish the desired results. The best grade of material and the highest skilled labor are utilized in the construction, and it has been adopted by some of the largest automobile manufacturers of the country.

The machine comprises a frame of conical form, in the centre of which is placed a vertical ground steel spindle in a step bearing in the base of the frame, and passing up through a long bearing at the top of the frame. This spindle at its upper end carries a face plate provided with two driving pins, which project upward parallel to the axis of the spindle. A steel centre with a taper shank is fitted into the vertical spindle. Its upper end is reduced to a conical point, and upon this rests the object to be balanced.

The vertical spindle is rotated by friction gearing driven by a horizontal shaft in suitable bearings at the base of the machine. The shaft is in two sections and they are connected by a friction clutch and moved longitudinally by a counter-weighted lever so arranged that the weight may be used to press the clutches together when it is desired to rotate the object to be balanced, and to disconnect the clutches when it is desired to examine, test and mark the object while running alone, as the driving pins are liable, when pressing against the part to be balanced, to produce uneven rotation. The true unbalanced condition is best shown when the disturbing influences are withdrawn after the clutch is released.

GARDNER AIR COMPRESSOR.



Compressed air in the garage is a necessity as it is expected by the motorist. Varying conditions require different installations and to comply with these requirements the Gardner Governor Company, 30 Williamson street, Quincy, Ill., is manufacturing air compressor systems both for the small garage and the service station. These include stationary and portable outfits, either operated by the power of the garage or by electricity.

The garage set shown in an accompanying illustration is an electrical unit and the design is provided with rollers so that it may be moved when desired, a construction making for convenience. It consists of a Gardner compressor connected by gearing to an electric motor, both units being mounted on a cast iron table underneath which are the air tank, gauge, automatic control, etc. The pipe connections are very complete and the outfit is supplied with either an air or water-cooled compressor as desired.

The automatic starting and stopping device is listed as extra and can be attached to the apparatus. They are made to suit any type of current and insure a constant pressure in the tank, it being maintained automatically. The garage sets are made in three styles, No. 1 G S comprising a two by 2.5 air-cooled compressor, .5 horsepower

Digitized by Google

direct or alternating current, two or three-phase, 110 or 220-volt motor, cast iron table, 14 by 26-inch tank and gauge. The same is constructed with a single-phase alternating current motor. The weight is 400 pounds.

Gardner Air-Cooled Compressor.

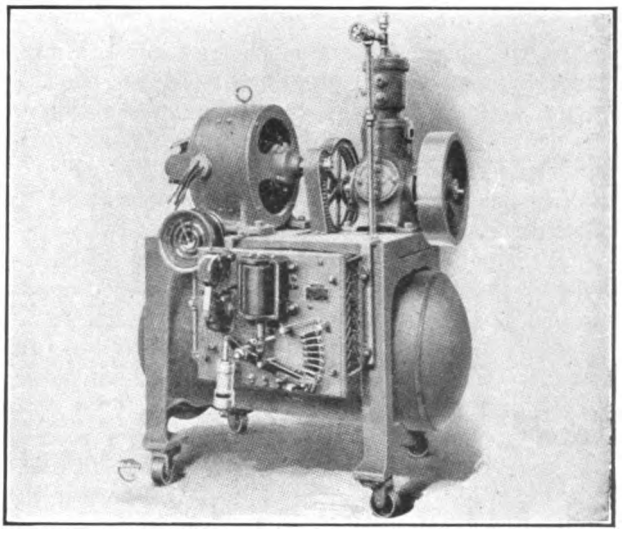
The No. 2 outfit includes a two by three air-cooled compressor, one horsepower direct or alternating current, two three-phase, 110 or 220-volt motor, table, 14 by 26-inch tank, etc. A one horsepower, single-phase, alternating current motor is listed as extra. The weight is 500 pounds.

The third style, No. 3, comprises a three by 3.5 water-cooled compressor, three horsepower alternating current, two or three-phase, 110 or 220-volt motor, cast iron table, 18-inch by 3.5-foot tank, gauges, etc. Direct and alternating current motors are also supplied with this equipment, which weighs 750 pounds.

The Gardner air-cooled compressor is made of high grade material, is semi-enclosed, with trunk piston fitted with metallic packing rings. The crankcase and cylinder are one casting, and steel ball valves are utilized in the head. The crankshaft is a drop forging and the connecting rod of special bronze and of square hollow section. The safety valve in the head can be set at any desired pressure and eliminates all danger of explosion due to excessive friction. The journal bearings are bronze bushings and are easily renewed. Lubrication of the main bearings and cylinder is by compression cups, while the crank, piston and wristpin are lubricated by grease stored in the hollow connecting rod.

The water-cooled type is designed for service in large garages, and the three by 3.5 size has a capacity of seven cubic feet a minute at 500 revolutions, and it is stated that it will fill an 80-gallon tank to 200 pounds in 15 minutes. The Gardner Governor Company issues an illustrated booklet on air compressor systems which will be forwarded free on request.

Official notice of the motor car service between St. Louis, Alton and Chautauqua, Mo., on the C. P. & St. L. railroad, has been given to the effect that two cars will be put in operation, one between Alton and Chautauqua and the other between St. Louis, Mo., and Springfield, Ill.



INDIANS WILL COMPETE.

Long Time Sleep Will Pilot His Car in National Reliability Tour.

For the first time in the history of automobile contests, full blooded American Indians will compete in the 1913 national reliability tour of the American Automobile Association, according to the announcement of the committee. Long Time Sleep, a Blackfoot Indian of the Glacier national park reservation, is the first to make entry, and it is stated that Chief Horse's Ghost of the Fort Peck reservation in eastern Montana, also is to drive a car in this event.

Following the plan adopted by the Minnesota State Automobile Association, which conducted a tour over the same route as will be taken by this year's national tour, a hotel train will accompany the entrants practically all of the way from Minneapolis to the Glacier national park. The tour is scheduled to start from Minneapolis, June 11, and will occupy nine days, covering 1131 miles.

Owing to the recent strict interpretation by the New York State authorities regarding inclusion in corporate names of words not in the English language, the application by organizers for a charter for the Motokart Company has been refused. The incorporation of this company was mentioned in a previous issue, but owing to this requirement the new concern has been incorporated as the Tarrytown Motor Car Company, Inc.

Gardner Garage Air Compressor Outfit, Including Electric Motor and Automatic Control.

The company will retain, however, the word Motokart as its trade mark, this having been registered some time ago.

MOTORING LAWS AND THEIR ENFORCEMENT.

Supreme Court Hands Down Another Patent Case Decision---New York Aldermen Reduce Taxicab Rates---Massachusetts Requires Report on Accidents.

A DECISION of particular interest to the automobile and allied industries was handed down by the United States supreme court May 26, the case being that of the Bauer Chemical Company against O'Donnell, involving the right of the defendant to sell a certain patented medicine for less money than that which the plaintiff had established as a retail price. Five of the nine members of the court held that the owner of a patent is not given the right by the patent law to control the price at which retailers must sell to consumers. The opinion was announced by Justice Day.

It will be remembered that about a year ago the supreme court handed down a decision in the so-called Mimeograph case, Henry against Dick, in which somewhat the same question was raised, a mimeograph having been sold at cost with the restriction that the paper and ink should be bought from the company selling the machine. At that time there were but seven members of the court on the bench, and the decision was reached by a vote of four to three. The court held in favor of the patentee in this instance, because the owner of the patent had not relinquished his interest in the mimeograph, inasmuch as he sought to obtain his profit from the sale of the paper and ink.

In the latest case the District of Columbia court, before which it was tried, held that the title to the article had passed into the possession of the druggist when he paid the price demanded of the owners, and that he then could dispose of it at any price he chose. This view is upheld by the supreme court.

After pointing out that the supreme court had held in the case of the Miles Medical Company against Clark and others that an attempt to fix prices by agreements where the article is not protected by a patent monopoly was "against public policy and void," Justice Day said: "It was doubtless within the power of Congress to confer such right of restriction upon a patentee." But he holds it has not done so. Quoting the case of the Bobbs-Merrill Company against Straus, in which the court held that the copyright laws, in securing to the holder of the copyright the sole right to vend copies of his book, conferred on him no greater privilege than to part with the title of it, and that he exhausted his rights when he sold his book to the first purchaser.

"The sale of a patented article is not essentially different from the sale of a book," said Justice Day. "In each case to vend is to part with the thing for a consideration. In providing for grants of exclusive rights and privileges to inventors and authors we think Congress had no intention to use the word 'vend' in one sense in the patent act and 'vending' in another in the copyright law."

PELLETIER ADDRESSES OPERATORS.

Suggests That Future Action of State Legislatures Will Depend upon Them.

District Attorney Pelletier of Boston was one of the principal speakers before the recent meeting of the Massachusetts Automobile Operators' Association in that city, at which some 300 chauffeurs were present. The address was received with much interest and portions of it were compiled for publication as follows:

Try to get the good will of all those who use the highways. Remember that the people who are unable to own motor cars have a bit of instinctive animosity against those who have them. So do not go along and give a blast of the horn that has the tendency to flaunt wealth in the faces of others; a sort of peremptory order to get out of the way.

Motorists, or any other class in general in this state, are not intentional law breakers. But there are laws and ordinances to be obeyed, and you must do your best to respect them. No one knows better than a district attorney what a multiplicity of laws are being broken. You young men, and all others who drive motor cars, cannot be too careful.

Upon your conduct depends future control by the legislature. If you are reckless; if you show a desire to disregard the rights and welfare of others on the streets and highways, then some day the legislature may pass a law that will place motorists in the same category as those brought up on liquor charges.

That means the entire matter of discretionary action will be taken out of the hands of district attorneys, and every motor case, no matter how trivial, will have to go to trial. Now in my office careful consideration is given to every appeal, and, despite criticism, I have acted from a humanitarian standpoint, believing that where there was no danger to life or property a violation of a minor nature of small moment should not blacken the character of some worthy person in future years.

Do not misunderstand me and think I mean to convey that such action may have a tendency to countenance violations of law. I feel that where one has had to spend his time in court waiting the disposition of his case, and has been to an expense for an attorney, and then has to pay something for costs, he has been punished enough for a minor violation. It teaches one that the law must be obeyed, and I know it is from the very rare instances where one is charged with a second or third offense.

So you have it in your hands to bring about a greater

Digitized by Google

feeling of good will. You set the example and others will follow. For those who have a willful disregard for the safety of others I can be as severe as any other prosecutor, for it is my duty to protect the rights of all. So what I would like you young men to do is to be careful, exceptionally so, and in that way you will be co-operating with me in securing protection and justice for all.

TAXICAB FARES REDUCED.

Private Stands Also Abolished in New Ordinance Passed in New York City.

After one of the most interesting sessions yet held the board of aldermen in New York City passed the so-called Grimm taxicab ordinance May 26, by a vote of 65 to one. The ordinance becomes effective 60 days after it is signed by the mayor. It not only abolishes the right of hotels and others to grant taxicab companies the right to stand in front of their doors, but reduces the present tariff.

Under the old tariff the same flat rates applied whether there were one passenger or more, these being 50 cents for the first half mile and 10 cents for each additional fifth of a mile, making a charge of 80 cents for the first mile and 50 cents for each additional mile. The new rates provide as follows: Not more than two passengers, 30 cents for the first half mile and 10 cents for each succeeding quarter mile, making a charge of 50 cents for the first mile and 40 for each additional mile; three or more passengers, 40 cents for the first half mile and 10 cents for each succeeding sixth of a mile, making a charge of 70 cents for the first mile and 60 for each additional mile.

The taxicab owners have requested a public hearing before the mayor, and some of them declare that in case the ordinance is signed they will take the matter into the courts.

CALIFORNIA'S NEW LAW.

Several Bills Before Legislature Combined in This New Statute.

Almost as soon as the legislature in California was organized for business this year several motor vehicle bills were presented, until something like 30 were before the two bodies. Members of the state and local automobile clubs were invited to co-operate with the legislative committee in the preparation of a new motoring law, and the result was placed before Governor Johnson for his signature last month.

The new law creates a road fund under the department of engineering, and an entirely new system of license fees is adopted. Heretofore California motorists have been permitted to escape with a perpetual fee, but beginning Jan. 1, 1914, they will be called upon to register their machines annually at the following fees: Less than 20 horsepower, $5; 20-30, $10; 30-40, $15; 40-50, $20; 50-60, $25; over 60, $30. The law also raises the speed limit on country roads from 20 to 30 miles an hour.

MUST REPORT ACCIDENTS.

Failure to Obey Law Will Mean Loss of License in Massachusetts.

The attempt to secure a practical method of eliminating reckless driving has been responsible for a number of interesting bills in the several legislatures during the past few months. Massachusetts will try an entirely new experiment, judging from the text of the new law in that commonwealth, which reads as follows:

Sec. 1—Every operator of a motor vehicle which for any reason is involved in an accident in which any person or property is injured, shall forthwith report the same to the Massachusetts highway commission.

Sec. 2—For any violation of the provisions of this act said commission may revoke or suspend the license of the operator.

It is understood that the original bill at least had the support of the Highway Protective League, but it appears to have been amended slightly before passage, the words "with a full account thereof" being eliminated.

LEGISLATIVE BRIEFS.

The Connecticut legislature is considering an amendment to the present motoring law, increasing the registration on commercial vehicles to $7 for the first 1000 pounds and $3 for each additional 1000 pounds.

Chief of Police Philip Smith of New Haven, Conn., has notified the Automobile Club of New Haven that many motorists in that city are violating the state law with respect to the rear lights and rear number plates, which provides that the sign shall be so placed with reference to the lamp that it shall be visible a distance of 60 feet.

Governor Foss of Massachusetts has signed the law making it unlawful for any person to operate air craft unless licensed to do so by the Massachusetts highway commission. The law also provides that no air machine may fly over a city at an altitude of less than 3000 feet or over a town at an altitude of less than 500 feet.

According to Secretary James Fortescue of the Massachusetts State Automobile Association, several members of that organization are anxious that a test case shall be brought in the courts of that commonwealth to determine the constitutionality of the present motoring law, with respect to registration fees. Mr. Fortescue says that in case action is determined upon motorists will be advised to file a protest when paying their fees, in order that they may recover, in the event the courts declare the law unconstitutional.

CORRESPONDENCE WITH THE READER.

Allowances for Fits.

(1593)—What is meant by a drive fit of an automobile part? I note reference made to it in your book. What other kinds of fits are used in automobile work? I repair my own cars and am anxious to learn all I can about the work. A. F. D.

Jersey City, N. J., May 16.

A drive fit is used in parts where close adherence is required, but which must be assembled and disassembled with no other help than an ordinary hammer; such as flywheels, gear wheels, ball bearing inner races, etc. The allowance over nominal diameter for driving fits is as follows:

Nominal diameter	.5-inch	1-inch	2-inch	3-inch
Maximum	0.50050	1.00100	1.00125	1.00250
Minimum	0.50025	1.00075	1.00100	1.00150

Force fits are employed in parts where disassembling will hardly be required, and which are assembled by means of hydraulic or screw presses, or when hot.

Push fits are employed in parts without relative motion in actual work, but which must have sufficient freedom to be assembled by hand, such as bolts, slip joints, ball bearing outer races, etc.

Running fits are used in parts possessed of relative motion in normal running. These can be sub-divided into easy, close and fine. Easy fits are those where great freedom of running is required with possibility of scant lubrication, such as valve guides, control connections, clutch shafts, etc. Close fits are to be used in all high speed work and especially the motor and transmission. Fine fits are employed in parts where great accuracy is required or where, while the motion is slight the stresses are of an alternating or vibratory nature, such as the small ends of connecting rods, steering connections, etc. Efficient lubrication must be provided if the motion is frequently recurring.

Function of Torque Arm.

(1594)—What is and what's the use of a torque arm? I note mention made of it in the descriptions of cars in your publication. I have a Cole car which I purchased recently and note that there is a brace from the rear axle to a cross member. Is this the torque member? COLE OWNER.

Pittsburg, Penn., May 25.

The function of the torque arm is to keep the axle in proper elevation alignment with the driving or universal joint shaft. It takes up all the rotation torque of the rear axle.

In the Cole car the torque arm is in the shape of a letter A, with drop forged fittings at each of the lower ends brazed to heavy tubing, and a crotch forging brazed to the other end of the tubing carrying a ball at the apex. The tubes or legs are secured together in two places through transverse clamps to prevent spreading and to eliminate vibration. The front end is securely but flexibly suspended from the centre cross member of the frame through a large, strong tubular casting, which makes it possible to utilize a 300-pound cushion spring on either side of the ball to soften or absorb the torque shock.

The thrust or drive of the car is not through the torque arm, but through the lower half of the springs direct to the large spring housing bolts at the side of the frame. The torque arm is attached to the axle by a large hardened and ground torque pin which permits a swivelling action sideways, and is encased in hardened steel bushings in the axle member.

Triple Ignition.

(1595)—I am very much interested in your article on fitting a Bosch magneto to a Ford car, but do not understand how you get the triple ignition referred to as possible. As I understand it one side of the double plugs is used for the magneto and the other for the regular generator. Can you give me an idea of the cost of installing the system described? A FORD OWNER.

Boston, May 30.

The installation of the magneto provides the third source of current for ignition work, although in the article referred to it is to be used for both starting and operation, it being possible to start the motor easily on a quarter turn of the starting handle. It should be borne in mind that the regular ignition system of the Ford car provides dual ignition with one set of plugs when dry cells or a storage battery are employed, although the auxiliary source of supply is not generally fitted because of the efficiency of the flywheel magneto for both starting and operation.

By examining the switch and coil on the dash it will be seen that the former has three positions, "Bat.," "Off" and "Mag." By connecting one side of a battery to the battery terminal on the coil and carrying the other lead to ground, a circuit is completed when the switch lever is moved to "Bat." and contact made by the commutator. With this arrangement it is possible to operate the motor on either the batteries or generator.

The system is entirely separate from the Bosch magneto and as the latter is of the true high-tension type, a separate switch is provided It differs from the usual member in its operation in that the circuit is open when the magneto is supplying current to the plugs, and closed to stop the operation of the engine. But one primary wire is utilized with the system, this being at-

Digitized by Google

tached to a terminal on the breaker box and led to the switch, thence to the frame. Closing the switch diverts the primary current generated by the magneto from the secondary windings to the frame circuit. The question relating to the cost of installation cannot be answered satisfactorily by the writer. The A. C. Danver Company, Providence, R. I., will supply the desired information.

Cause of Tire Troubles.

(1596)—I have a car that I rebuilt into a roadster. It was a five-passenger touring car and I figure that the removal of the tonneau and top has lightened the load several hundred pounds. But in spite of the lighter weight I am experiencing as much tire trouble as formerly. The front shoes wear out much quicker and according to my figures I get several hundred more miles from the rear casings than the front. All the blow-outs come in the front shoes. I was of the opinion that the rear tires get the hardest wear. How do you account for the difference? CONSTANT READER.

St. Paul, Minn., June 1.

The difference in mileage obtained is doubtless due to the fact that the rear shoes are carrying considerably less weight than formerly when the machine held five persons. Unless the front seats were moved back the front tires are subjected to practically the same stresses as before. There are a number of other conditions which might cause the front casings to deteriorate, such as the wheels not being in line, improper inflation, etc. The capacity of the shoes could be checked up by weighing the car as outlined in the May 10th issue, and noting the difference between the weights carried by the front and rear axles.

Increasing Efficiency of Motor.

(1597)—Is it possible by slightly altering certain parts of the motor to increase the horsepower, such as boring out the cylinders, changing timing, etc.? Would you advise the work and would the results warrant the expense involved? I have a four-cylinder motor of 4.25-inch bore and 4.75-inch stroke and although the valves are in good condition I do not get the power I did formerly. Would timing the valves slightly earlier prove beneficial? I am a reader of the questions and answers department and derive considerable practical information from same. One garageman advises me not to change any part of the engine while another repairman states that he could improve the motor considerably by boring out the cylinders, fitting double ignition and larger valves. He would not give me any price, stating that it would be a case of labor and material. Kindly give me the benefit of your experience in such matters. INFORMATION.

Worcester, Mass., May 23.

The efficiency of some types of old motors may be increased by certain alterations, such as reboring the cylinders, enlarging the valves, etc., but in the case of an old engine the results obtained would not be proportional to the cost. Of course much would depend upon the condition of the power plant and other components of the chassis.

While reboring the cylinders would increase the power slightly, it would mean fitting new pistons and new rings, the need of the former depending upon the amount of metal removed from the cylinder walls. Fitting a new or larger power plant entails radical alterations which rarely justify the expense involved, and a car converted in this manner is not always easy to dispose of.

There are a number of conditions aside from the power plant that waste power and the chief factor is the resistance created by all four wheels not being in alignment. Too much emphasis cannot be laid upon the importance of having the wheels track perfectly. The general tendency is for the front wheels to spread at the front, while the rear axle, and often the front, settles further back at the right hand side owing to the fact that the right hand springs generally take a permanent set. This is caused by the car being utilized only by the owner. As a result the right springs carry more load and this has a tendency

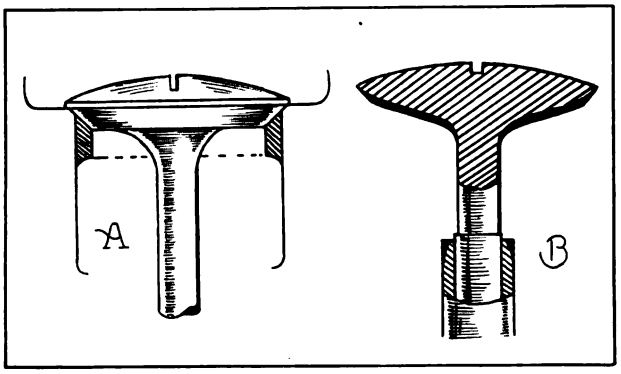

Fig. 1—Increasing Efficiency of Motor: A, Showing How the Valve Port Area May Be Increased by Cutting Away a Portion of the Seating; B, Improving Outline of Inlet Valve, the Solid Black Portions Representing the Metal Eliminated.

to push them toward the rear, causing the tires to drag slightly and absorbing power.

Brakes are often the cause of lost power. Because the wheel spins freely when jacked up it is not indicated that friction does not develop when the machine is loaded, and slight frictional contacts often pass unnoticed under these conditions. Worn bearings in the rear wheel, the presence of mud, etc., frequently create friction. The writer knows of an owner who adjusted the brakes and the wheels rotated very freely when free from a load. The loss of power through friction was not discovered until it was noticed that the mileage a gallon of fuel was considerably less than formerly. A search revealed the fact that the brake drums became warm after a spin. A correction of the faults resulted in maximum efficiency.

Unnecessary resistance may occur in the

Digitized by Google

transmission and is sometimes caused by the use of a heavy grease because a light lubricant leaks out. It has been demonstrated in tests that from three to four horsepower is consumed by the utilization of too heavy a grease. The universal joints are another source of lost power when not properly lubricated. The radius rods or their equivalents should be perfectly free, also any sliding joints in the driving shaft, as any interference with the rise and fall of the rear axle will cause slip of the driving wheels and loss in speed. Rusty springs and dry shackles prevent free movement, adding their mite to the friction. Thus it will be seen that the proper lubrication of each working part is an important factor.

Regarding valves, it is not as a rule possible to fit larger ones, but alterations may be made to improve their efficiency. Without going into details it may be stated that it is important that the flow of the mixture from the carburetor to the cylinders be not obstructed. Any projections, such as squares or corners on the valve and near

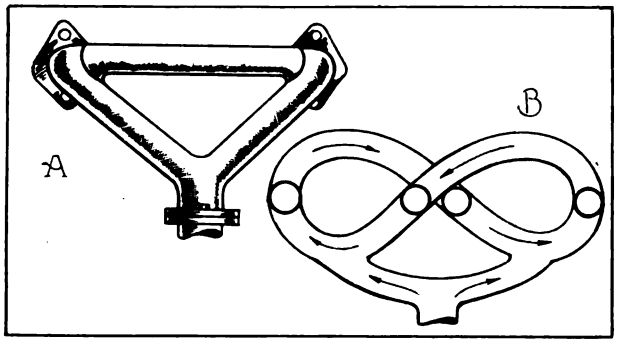

Fig. 2—Improving Design of Intake Manifold: A, Connecting Tops of Y Shaped Member; B, Type Utilized on Racing Cars and Which Causes the Gases to Travel in One Direction Only.

its seat, tend to obstruct and deflect the gases.

An improvement can be made in the inlet valve as shown at Fig. 1 A. The same size valve is retained but the port area has been increased by cutting away a portion of the seating, the metal removed being denoted by the shaded sections. This naturally reduces the obstruction to the incoming gas very materially.

At B is presented a sketch showing how the outline of an inlet valve may be improved and brought nearer the streamline shape. The suggestion was made by a prominent English engineer in Internal Combustion Engineering. In order to give the incoming gas a flow as easy as possible, a part of the under side of the inlet valve is removed. This part of the valve requires the most treatment, leaving only a narrow conical face for the proper seating. It was suggested that the valve guide be rounded off correspondingly at its upper end, and that the neck of the valve also be reduced to minimize the obstruction to the under side, but this would appear to weaken the valve at a point where it receives its maximum stress, particularly with quick drop cams and strong valve springs. The exhaust valve could be treated similarly by cutting away the metal as shown at A and enlarging the port area.

Sometimes a considerable improvement is possible by fitting a new intake manifold, especially if the old member be small and its bends such as to obstruct the flow of the gases. To obtain efficiency the intake pipe should be of liberal dimensions and have easy bends, such as is noted in modern motor construction.

With a motor firing 1, 3, 4, 2, the gas goes first to the cylinder, next to the radiator, and is then forced to travel to the third and fourth, after which it must flow back to the second. There is a pulsating effect set up, which at high speeds becomes an important factor and with poorly designed manifolds prevents two cylinders from being filled properly.

At Fig. 2 A is presented a suggestion for improving a Y shaped intake manifold. It consists of connecting the tops of the Y together, giving the gas a short cut. On some racing cars utilized abroad, induction pipes of an eight shape are employed, such as shown at B. The advantage of this construction is that as successive inlet valves open the mixture continues to travel in one direction, eliminating the reversal of the gases with the usual form.

As the use of the cut-out is prohibited in many states a loss of power may be caused by back pressure existing in the exhaust pipe and muffler. A large pipe of easy bends is to be preferred to a smaller one, and a long member is better than a short as the momentum of the exhaust gases passing through it has a slight scavenging effect.

Whether an alteration of the timing of the valves would improve the power would depend on the condition of the cams, gears, etc. If they be worn badly the timing gear might be set one tooth ahead and the results noted. As a rule the timing given by the maker is best used. Two spark plugs in each cylinder and fired simultaneously, are held to improve the power, but the results obtained would depend upon the location of the plugs.

The writer does not advise making any radical changes in the power plant as the expense would be apt to be considerable. A thorough overhaul would prove more satisfactory.

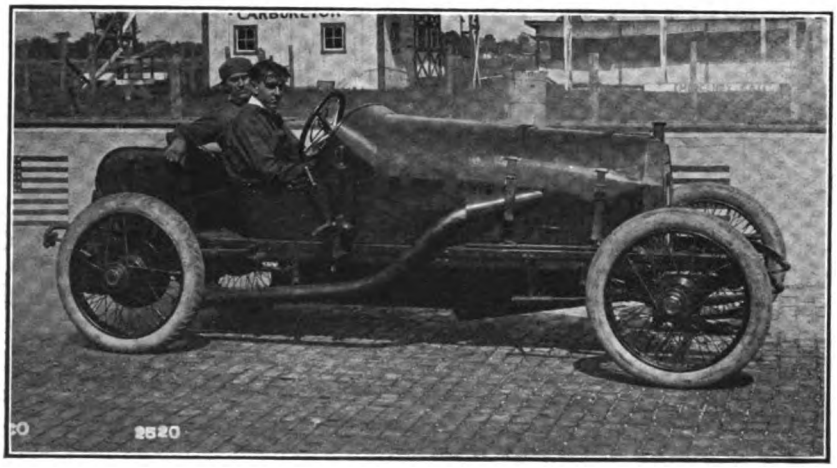
GOUX TAKES CHIEF SPEEDWAY HONORS.

Wishart Second with Mercer---Spectacular Finish for Merz and Stutz in Third Place---Race Much Slower Than Last Year---Splendid Driving the Feature.

JULES Goux of France, driving a French built Peugeot car, won the third annual international sweepstakes race on the Indianapolis speedway Memorial Day, his speed being 75.92 miles an hour, as against 78.73 for Joseph Dawson in a National last year and 74.65 for Ray Harroun in a Marmon in 1911. Spencer E. Wishart, in a Mercer, one of the smaller cars in the race, was second, and Charles Merz, in a Stutz, was third. The full list of prize winners is given in tabular form elsewhere, and this table also shows that the first four cars to finish a year ago travelled at faster speed than the winner in this third event.

The result, insofar as determining the winner was concerned, occasioned very little surprise, since the Peugeot has long been regarded as the fastest machine produced abroad, but it was expected that much greater speed would be made. Goux won last year's Sarthe Grand Prix in France with a car of this make, covering 402 miles of highway at a speed of about 73 miles an hour. While Goux is considered one of the best drivers in Europe, his work has been confined almost entirely to road racing, until recently, when he tried out the so-called Indianapolis machine on the Brooklands track, Weybridge, England, covering 106 miles 307 yards in an hour, and creating a new world's record. It is only fair to state, in this connection, that Goux maintains he was not permitted by his manager to drive his car as fast as he desired, greater speed not being necessary to win the race. And in this comment is found a clue as to the methods used by foreign drivers, Americans being free to exercise their own judgment while at the wheel.



Jules Goux of France and the Peugeot, Winning Combination in the Third Annual International Sweepstakes Event at Indianapolis.

Another element which worked against fast time was the excessive heat. This not only was hard on the tires, tire changes being much more frequent than heretofore, but it had its disastrous effect upon the drivers, several of whom were replaced at intervals by those who had been retired from the race and by others who were not scheduled to appear. The fact that the event was limited to cars of not more than 450 cubic inches piston displacement, instead of being a free-for-all as in previous years, probably also was reflected in the final score.

An accompanying table sets forth some of the intermediate times, by which it may be determined that several new class records were established. The free-for-all marks were never endangered, it would appear, and with the exception of that for 50 miles all these were created during the 500-mile event of 1912.

Over 100,000 persons saw the race, according to the statement of the management, and seldom, if ever, has it been possible to witness a better exhibition of generalship in a high speed event. Only one serious accident took place. According to eye witnesses, the Mason, driven by Tower was approaching the west end of the bleachers at a fair rate of speed when one of the front wheels was seen to give way. The car rushed toward the retaining wall and then backed down across the course until it struck the soft earth at the side of the track, where it turned completely over. Tower and his mechanician, Lee Gunning, were thrown out, the former receiving a broken leg and the latter internal injuries. Examination of the machine immediately after the accident failed to disclose the cause.

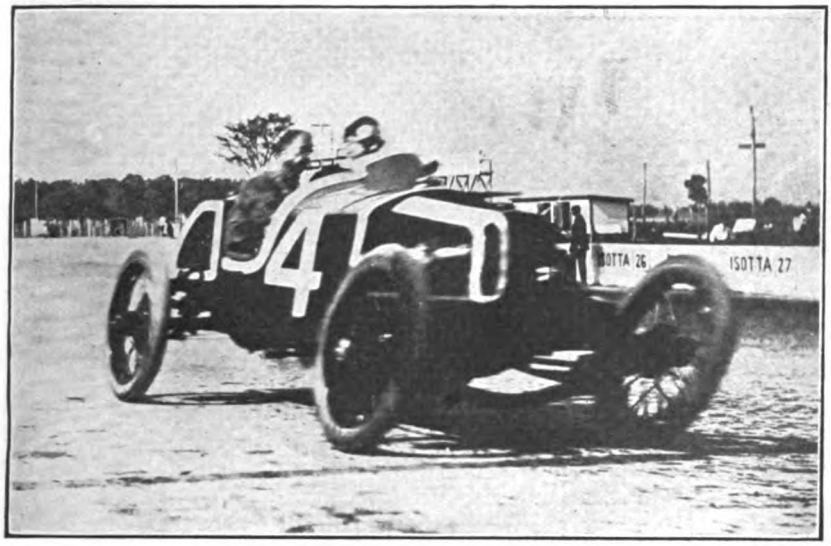
Digitized by Google

Spencer E. Wishart and the Mercer Car He Drove to Second Place in the Memorial Day 500-Mile Race.

Twice during the race one of the machines was discovered to be in flames. At 137.5 miles, Burman's Keeton, which had been showing some of the best speed of the day up to that time, caught fire. He put out the blaze with sand and returned to the pits, losing much valuable time. Later, soon after returning to the track, he was driving beside the Sunbeam, when that car lost a tire. A piece of this casing struck the Keeton's gasoline tank and thereafter it became necessary to stop the leak with chewing gum, etc., at frequent intervals. Burman and Hugh Hughes, who spelled him at times, managed to keep the car on the track and at the finish it was still running, the only one of the 27 starters which was running and failed to get a prize. Despite these two pieces of hard luck the Keeton gave every evidence of being a splendid machine, and the crowd shared in the disappointment which followed its initial appearance in racing.

On the next to the last lap the Stutz, driven by Merz, was seen to be in flames. Starter Root gave the machine the green flag, indicating but one more lap to go, and instead of stopping to put out the fire, Merz and his mechanician, Harry Martin, apparently gave no heed to the flames, which were then blowing in their faces. The final 2.5 miles were driven at the same pace as the others, and just before the car was slowed down for the finish line, Martin crawled out on the hood and loosened the straps, while Merz stood up in his seat, his hand on the wheel.

This winning of the third prize by one Stutz was preceded by a practical duplication of the ill luck which befell Ralph DePalma and his Mercedes in last year's event. It will be remembered that last year DePalma had been in the lead practically throughout the race until the next to the last lap, when his Mercedes failed him and although he and his mechanician attempted to roll it into the pits by hand, he was forced to retire with the sweepstakes award almost in sight. This year Gilbert Anderson and his Stutz, which had been in second place since the 150th mile, stopped at the pits for tires at the end of 495 miles. He inadvertently stalled his engine, and when his mechanician attempted to crank it again he was unable to turn it over. The trouble could not be located and remedied before the race was finished, and second place went to Wishart in a Mercer.



At one point in the race Evans' Mason lost a tire and in the double skid which followed the machine was turned completely around. The mechanician cranked the engine and the car was under way to the pits without serious loss of time. No one was injured. This completes the list of accidents.

The racing machines lined up behind the president's car for the formal parade around the

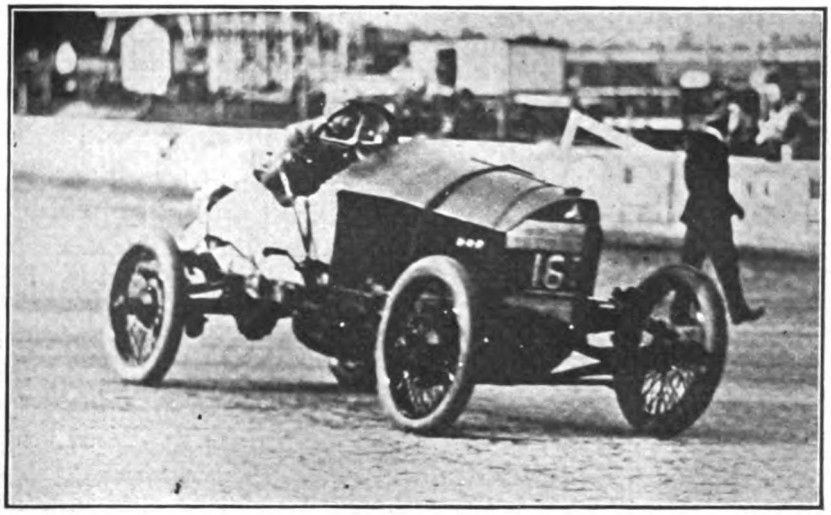
Robert Burman and the Keeton, Which Gave a Splendid Exhibition Despite Repeated Ill Luck.

track and were sent away with a flying start. Evans was the first to complete the initial round of the course, with Goux close behind him and Herr's Stutz in third place. The second time around Goux was leading Evans, and Clark and the Tulsa had replaced Herr. Evans regained his lead on the third lap, but failed to show up when Goux appeared for the fourth time. Haupt's Mason took second place at this point.

During Evans' temporary retirement Goux came very near lapping him, but the Mason was back on the track just in time. Goux lapped Disbrow and Clark on the seventh round. On the eighth the Schacht made the first stop for tires, and thereafter there was plenty of work for the men in the pits. Goux made his first stop for tires at the end of 25 miles, and Burman took the lead, followed by DePalma's Mercer, Nikrent's Case and Haupt's Mason, in that order.



DePalma's ill luck appeared to be with him as he was the first to be retired permanently on the 17th lap. Harry Endicott followed him closely. Jenkins and Zucarrelli both were out at the conclusion of 50 miles. At this point Guyot's Sunbeam was in the lead, his time for the distance being 37:29.29, a new class record.

Burman again took the lead at the end of 60 miles. At 75 he was still leading with Goux and Guyot fighting for second place, and Haupt not far behind the three. At 87.5 miles Nikrent had worked into second place, with Burman leading him by only 30 seconds. At 100 miles it was Burman, Goux and Anderson, with a new class record of 1:15:50.55 to Burman's credit.

Grant was out at 85 miles and his teammate, Trucco, followed him at 90. Later, Grant was in the race for a short time, taking the wheel of the Henderson from Knipper for some little distance. William Endicott went out at 120 miles, when Burman was leading, with Goux, Anderson and Merz behind him. Goux went into first place when Burman's car took fire, but lost his position to Anderson when forced to stop at 140 miles. At 150 miles it was Goux, Anderson, Guyot, Merz and Wishart, with the others making up the field.

Mulford had replaced Merz in fourth position at 200 miles, at which point Goux took the Remy grand brassard and Remy trophy. Mulford's first stop, and that for gasoline and oil, was made at 285 miles. This was the best showing of any car in the race, and it may be well to add that the machine was the same as that which failed DePalma on the final stretch a year ago.

At 300 miles Goux was the victor of the Prest-O-Lite trophy. Anderson was in second place and Mulford in third. These positions were unchanged at 380 miles, when Merz made one of

T. Pillette's Mercedes-Knight, the Smallest Car in the Race, Using First Knight Motor in an American Long Distance Event.

Tulsa, Clark	7:56:14.25	62.99	Knox, Mulford	8:53:00	56.29	Jackson, Cobe	7:21:50	67.89
						Stutz, Anderson	7:22:55	67.74
						Mercer, Hughes	7:23:32	67.65

the quickest tire changes of the day, being off the track hardly more than 30 seconds. At 400 miles Goux took the Wheeler-Schebler trophy. Shortly afterward, at 420 miles, Goux and Anderson entered into one of the prettiest brushes of the entire race, but Goux was not to be dislodged from first position.

The finish already has been told. There was no doubt concerning first place. Anderson's unfortunate failure at 495 miles, moved all other contestants up one point each. Mulford had long since lost his position as third, and Wishart immediately went into second place. Merz seemed secure in third, the only doubtful factor being the fire mentioned above. The other contestants were too far behind to disturb these positions unless other failures should take place.

If the result of the race depended largely upon the tires, then a substantial share of the credit should fall to the product of the Firestone Tire & Rubber Company, Akron, O., for Firestone tires were fitted to the machines finishing in first and second place. The two front shoes on the winning Peugeot went through the entire race without change.

Despite the fact that tire changes were frequent, there were several sets which stood forth prominent in this contest. Among these were the Braender shoes, made by the Braender Rubber & Tire Company, Rutherford, N. J., fitted to Mulford's Mercedes, finishing in seventh place. It already has been mentioned that Mulford's first stop was at the end of 285 miles. He did not stop throughout the entire race because of tire trouble, the four original Braender shoes going the entire 500 miles without changing.

Equally as gratifying was the service rendered by the Miller tires, made by the Miller Rubber Company, Akron, O., and used on Louis Disbrow's Case, in eighth place, which went through the entire race without trouble. Similar shoes were fitted to Tetzlaff's Isotta, which went out at 290 miles, and with the same results.

The ignition is another important factor in long distance events. Bosch magnetos were fitted to the first seven cars to finish, and seven of the prize winners also used Bosch plugs. The Bosch Magneto Company, New York City, has forwarded checks for $500, $300 and $200 to the first, second and third place drivers respectively.

The Rayfield carburetor, made by the Findeisen & Kropf Manufacturing Company, Chicago, was fitted to the Mercer finishing in second place, and therefore is entitled to claim American honors for the event. Rayfields were utilized by two other machines finishing within the prize money. Burman started the race with another make but changed to the Rayfield after the fire.

Truffault-Hartford shock absorbers were used by the cars finishing in first, second and third place, and were fitted to 25 of the 27 machines which started. It is maintained by the maker, the Hartford Suspension Company, Jersey City.

N. J., that these devices added materially to the comfort and safety of the contestants.

The accessory equipment of the various cars, as supplied either by the entrant of the machine or the maker of the equipment, is to be found in an accompanying table.

This was the first American long distance event in which the Knight motor has been entered. Two cars utilizing this type of engine were entered, although the Pennebaker, with a reconstructed Stearns-Knight engine, was withdrawn shortly before the start. The Mercedes-Knight, driven by Pilette, finished in fifth place. This would appear to establish the Knight motor as being capable of competing successfully against engines of the so-called poppet valve type. It may be added that the Mercedes-Knight machine was the smallest car in the race.

The winning Peugeot is of particular interest because this make of machine is somewhat new in this country. The motor is with cylinders cast en bloc, and with the valves set into the cylinder heads at an angle of about 30 degrees. The valves are in duplicate throughout and the seats are on the under side of the cylinder casting so that they are closed when they are raised. They are operated by a single camshaft running over the top of the cylinders, covered by an aluminum housing and driven by a vertical shaft from the crankshaft. Oil is forced to the engine bearings at a pressure of 30 pounds to the square inch as compared with a pressure of about two pounds with most American racing machines. The weight of the car, with tanks empty, is given as 2200 pounds. The capacity of the gasoline tank is 36 gallons and of the oil tank, eight. The wheelbase is 108 inches.

No less than 15 of the 27 cars were fitted with wire wheels, this being a much larger percentage than has been true in former contests in America. Rudge-Whitworth wheels, made by the Standard Roller Bearing Company, Philadelphia, and sold through the George W. Houk Company of that city, were utilized on the cars to finish in first and second place, as well as on a number of other machines. Merz's Stutz was fitted with wood wheels.

The accident to the Keeton, driven by Burman, was particularly unfortunate, because the machine was well established in first place when it happened and lost its opportunity to win the event through no fault of its own. That it was able to continue for 465 miles after having been damaged by fire and with its gasoline tank leaking as the result of a puncture caused by a flying valve from the Sunbeam's bursted tire, would seem to indicate its superior ability. It may be added that during the time it was on the track only one of its four Firestone shoes was changed. Its next to the last lap was the fastest of the day, and Burman drove the car, without change, the following Sunday, covering one lap of the speedway in 1:36, or at a speed of 93.5 miles an hour. Burman has challenged Goux for a 500-mile match race between the Keeton and the winning Peugeot, and it is understood that A. G. Kaufman, president of Peugeot Auto Import Company, New York City, has accepted in behalf of Goux.

(Continued from Page 32.)

ing the most practical and accurate. The only observation necessary on this method is one dealing with the reconsideration of L at a later period. When the life of a vehicle is reconsidered, the unexpired capital outlay should be taken as the basis for the revised charge for depreciation. Thus suppose $\frac{C-R}{L} = \frac{500-50}{5}$, the annual depreciation being £90 ($437.98); by the end of two years the capital outlay would have been written down to £320 ($1557.33). If the estimate of life be then revised and extended to seven years in all, with five more to run, then $\frac{C-R}{L} = \frac{320-50}{5}$ = £54 ($262.78) annual depreciation.

Obsolescence is a factor which has to be considered, as it is by no means improbable that some combination of circumstances may render it desirable to dispose of a particular vehicle before it is really worn out. From a strict accounting point of view obsolescence may not be depreciation, but the factor is at least of sufficient importance to "round up" any percentage that may be determined by other considerations, and if, in the future, by perfecting the machines, their ordinary working life can be reckoned as longer than it is at present, obsolescence will become of more importance, for a machine which is still quite efficient mechanically may be rendered uneconomical by the introduction of improved types. When such time arrives it may be prudent to make provision under this head, which while not strictly proper to depreciation may very conveniently be connoted.

There remains one other detail for consideration, namely, the treatment of small additions to plant. The effective life of the additions may or may not be coterminous with that of the vehicle, and any attempt to bring their depreciation within the scheme for the depreciation of the vehicle itself would cause complications which it would not be worth while to incur. The practise recommended is to regard such small additions as chargeable to maintenance, which, in effect, means writing them off at 100 per cent. in their year of purchase.

WOOD AND METAL MOTOR TRUCK WHEELS.

(Extract from paper read by Arthur J. Slade, member Society of Automobile Engineers, at midsummer meeting.)

It is perhaps natural that wheels built of wood should have been developed to a high state of perfection in this country where such a large and varied supply of wood is available. The rapid development of the West called for vehicles of rugged and sturdy type for the pioneer's use in opening up a country without roads of any sort. Later the transportation companies, operating stage coaches over roads little more than trails, as new sections were settled, and eventually the agriculturist, who even now often operates his farm wagons over roads unworthy the name, demanded the highest quality of wheels.

The majority of the motor trucks built in this country have been equipped with wooden wheels; the earlier wheels conforming closely to the design of horse-drawn wagon wheels, especially with regard to size of spokes, but also, in some instances conforming to wagon wheel practise even to the extent of wooden hubs. Some of these wheels, dating back perhaps 10 or 12 years, are still in service on motor trucks in New York City.

Development of Wood Wheels.

The first radical improvement was in the substitution of metal for wood hubs, primarily to make possible the use of anti-friction bearings. Next came a radical change in the matter of spokes. When it is considered that a wagon wheel on a five-ton capacity vehicle seldom has a tire exceeding four inches in width, whereas the tires on the five-ton motor truck will usually total from 10 to 12 inches in width, it becomes obvious that the wide felloe on the truck wheel should be supported by a spoke of much greater width than the narrow felloe of the wagon wheel.

Since 1907, when the importation into America of one of the most successful European trucks began, the improvement in the design, as well as construction, of wood wheels has been very marked. At that time one of our leading wheel builders undertook to practically duplicate these European wheels with spokes about five inches in width, flaring at the outer end so as to form an adequate support for the felloe, and also of sufficient cross section to ensure a good shoulder on the end of the spoke against the inner surface of the felloe. Ever since that date the wheel builder in question has been manufacturing wheels, from designs similar to this, with great success; and, although some other wheel builders contended at the time that it was not feasible to procure wooden billets of a size suitable to finish spokes of such unusual dimensions, the majority, if not all, of the wheel builders catering to the motor truck industry are now building wood wheels of this general type.

Early Metal Wheels.

It must not be assumed, however, that the practise of motor truck builders in this country has been confined exclusively to wooden wheels. As far back as 1858 and 1862 motor trucks are reported to have been built, in an experimental way, with steel wheels. In the years 1903 and 1904, when the motor truck industry in this country was making a definite commercial start, the Gibbs Engineering & Manufacturing Company equipped trucks with cast steel and steel disc wheels. The cast steel wheels were similar to those now being advocated by several manufacturers, having hollow spokes integral with hubs and felloes. They were made of crucible steel and used a tire constructed from a combination of wood, steel and rubber. About 20 five-ton trucks were built and the wheels were found to be on the whole satisfactory. The disc wheels were made of boiler plate, riveted to cast steel hubs and to a steel tire band. These wheels were also said to have given satisfactory service, but the company building the trucks in question no longer exists.

In 1905 the Couple-Gear Freight-Wheel Company brought out a line of trucks equipped with wheels made up of steel plates. In the interior of the wheels an electric motor was mounted, and this same construction has been followed by that company up to the present date. At about the same time the Four-Wheel-Drive Wagon Company of Milwaukee, brought out five and 10-ton capacity gasoline trucks equipped with wheels on which the tires were segments of rock elm and the side plates were steel discs. This company is not now in existence.

In 1906 a metal wheel, known as the "Indestructible Steel Wheel," was introduced to the market in Chicago. These wheels were built of side discs of steel, reinforced inside with structural shapes; the various members of the wheel being riveted together. They were used on trucks built by the Reliance, Commerce, Rapid, Plymouth, Grabowsky and Packard companies, of which all but the latter have discontinued manufacturing, and the Packard company only used a limited number. The Rapid company is said to have continued their use the longest, covering a period of about two years. The severe strains and shocks due to irregular road surfaces are reported to have loosened the rivets holding the various members together, and the wheels were not found to be permanently satisfactory.

In 1908 the Morgan truck of five tons capacity was brought out with a disc type of cast steel wheel which proved unsatisfactory and was superseded in 1910 by a cast steel wheel with spokes of the general design with which we are familiar.

In 1909 the White company introduced steel wheels on the larger sizes of its commercial vehicles. It is understood that modification of the design of these wheels was necessary to eliminate breaking of the spokes near their point of union with the felloe, and their present design seems comparatively free from breakage. The A. O. Smith Company on its heavy gas trucks has used cast steel wheels since 1911. The same is true of the Locomobile company on its well known trucks.

From time to time trucks have been imported from abroad equipped with steel wheels, notably the Orion, Bussing, Gaggenau, etc. However, the best known European trucks coming into this country are equipped with wood wheels, notably the De Dion and Saurer. I wish to acknowledge my indebtedness to Charles E. Stone, member of this society, for his assistance in compiling the above facts.

Current Practise.

It will be noted that comparatively few well-known truck builders in this country are at present using metal wheels and those who are using them have not previously used wooden wheels.

There is one notable exception, however, the Pierce-Arrow Motor Car Company, on some of whose trucks I have recently seen cast steel wheels, although since the introduction of the Pierce five-ton truck on the market wooden wheels have been standard. It is hoped the engineers of that company will give us the benefit of their experience and their reasons for making this change.

The vast majority of motor truck manufacturers, including those whose product dates back to the beginning of the motor truck industry in this country, have used wooden wheels consistently, improving their design from time to time, but not abandoning a material for wheel construction which has on the whole proved entirely satisfactory.

Through the courtesy of George R. Wadsworth, member of this society, I have been furnished with reports on the mileage and condition of the wood wheels on a large group of gas trucks of three, four and five-ton capacity, which show that in some cases the mileage covered approaches closely to 70,000. On the assumption that the tire mileage secured on these trucks is 10,000 miles a tire, this would mean that some of the wheels have been subjected to six tire changes. The report states, regarding these wheels, that "they were all in first class condition and not a moment's inconvenience or delay has been caused by them and there is not the slightest indication of trouble in the near future." These wheels, it is scarcely necessary to say, are of modern design, are accurately constructed of suitable material, and are carefully inspected for conformation to the accepted S. A. E. motor truck wheels standards. The contention that wood wheels get out of round and present difficulties in tire application does not seem to be substantiated in this case.

Claims for the Metal Wheel.

At the present time there is undoubtedly a general effort being made by manufacturers of parts for motor trucks to add metal wheels to their product; and with the exception of one manufacturer, who proposes to build wheels of malleable iron, all of them are building their wheels of cast steel.

What, then, are the specific advantages offered by metal wheels which should influence a motor truck designer to specify metal construction rather than wood? The advantage must be such that it can be proved to the purchaser of the truck that he will secure an actual financial gain by the change which the engineer proposes, because to the purchaser the prime questions are the expense of operating and maintaining the truck over a period of years and the earnings or savings which the vehicle will effect. Theoretical considerations, unless borne out and proved in practise, are unavailing. Practical service conditions count with the hard-headed business man—not laboratory or experimental tests and calculations.

First, it is claimed by one of our members, who is chief engineer of a company about to place cast steel wheels on the market, that: "It is now conclusively proven that there is a distinct saving in tires on steel wheels. Some of the largest tire manufacturers guarantee as much as 30 to 40 per cent. longer life on steel than wood." Inquiry made of the leading tire manufacturing companies, verbally or by letter, has failed to verify that statement. The opinion of several tire company officials seems to be personally in favor of metal wheels for the one reason that they are likely to be made more accurately to size, but the tire companies positively decline to guarantee an added mile or to even express the opinion that added mileage can be expected.

As to the question of accuracy of workmanship, it is entirely feasible for the wood wheel manufacturers, under the present S. A. E. standards, equipping the wheels with S. A. E. bands, to work within the necessary tolerances and provide wheels which will have the accuracy required. Accuracy in workmanship is a question of care in construction and careful inspection and the manufacturer who insists upon accurate wood wheels conforming to S. A. E. standards has no trouble in securing them.

Another claim made for metal wheels is that their strength is greater than wood wheels. Assuming the cast steel wheels to be free from defects, and to have the chemical and physical characteristics recommended by the iron and steel division, these wheels certainly develop marvelous resistance to shocks. I witnessed a test of such a wheel recently which was subjected to the impact of a weight swung as a pendulum against the side of the felloe and the wheel was deformed beyond the semblance of a wheel and even then did not show any fracture. At the same time, as has been pointed out by the iron and steel division, steel castings cannot be inspected against blow holes, and had the wheel in question contained some concealed defect, failure in testing would probably have resulted. The difficulty in securing uniform steel castings free from defects and conforming to the S. A. E. standards is generally conceded and several of the foundries making cast steel wheels in this country at the present time are having difficulty in making steel castings of other motor truck parts which will pass the inspection of some of their customers. As to the strength of well constructed and properly designed wood wheels, the front wheel of a truck manufactured by one of my clients came in contact recently with a road obstruction with such impact that the strain broke the steering gear, but the wheel was uninjured, and on another truck a rear wheel was subjected to such an impact that the axle spindle was bent without injury to the wheel. Therefore, on the question of strength, that of the high-grade wood wheel is entirely adequate for commercial purposes.

The contention is also made that the metal wheel will dissipate heat more effectively than the wood wheel. There has come under my observation no case in which a truck tire on a modern motor truck has been injured by lack of heat radiation under service conditions. I assume that the heat developed in a solid rubber tire is due to the deformation of the rubber and this is greatest near the surface of the rubber which comes in contact with the ground. This surface is in contact with the air and I should expect that the heat would be radiated through the air more easily than transmitted through the base of the tire to the wheel and hence radiated by the wheel, felloe and spokes.

Cost and Weight.

The fourth point in considering the relative merits of wood and metal wheels is the comparative cost and weight. From information received from one of my clients regarding wood wheels being regularly manufactured and used on this company's trucks, and from information received from the chief engineer of one of the companies which is bringing out cast steel wheels, the following comparison of weight and cost has been made:

Set of wheels for three-ton truck to take 36 by five-inch tires, front; and 40 by four-inch dual tires, rear; wood wheels equipped with S. A. E. band and Timken hubs and flanges—steel wheels having band and hubs integral—

	Weight.	
Wood	Steel	Increase of Steel Over Wood
Front 122 lb. each	151 lb.	12.4%
Rear 212 lb. each	373 lb.	76.0%
Set 668 lb. each	1048 lb.	57.0%—380 lb.
	Cost.	
Front each $20.00	$26.80	34.0%
Rear each 30.00	52.10	74.0%
Set each 100.00	157.80	57.8%—$57.80

Information obtained from a European manufacturer of cast steel wheels indicates that their weight is substantially the same as American cast steel wheels, but the price is 25 to 50 per cent. higher, thereby placing the steel wheel at a still further disadvantage as far as cost is concerned. Consequently, it would appear that the cast steel wheels are both costlier and heavier than the wood wheels. The burden of proof seems to rest with the metal wheel manufacturer, that they have an economic advantage over the wood wheels, resulting in a financial saving to the owner of the truck equipped with metal wheels.

Drop Forgings.

There is one type of metal wheel which might overcome the disadvantage, real or fancied, of the wood wheel, and which would at the same time eliminate the element of risk always existent in a casting, and also the criticism of the built-up structural steel wheel, the loosening rivets. This is the drop forged wheel. Drop forgings of high grade steel, which after suitable heat treatments, develop extraordinary physical characteristics, would, in my opinion, be an ideal construction, unless their first cost proved prohibitive. I hope we may hear something from the drop forging experts among our membership in regard to the feasibility of such a construction for motor truck wheels.

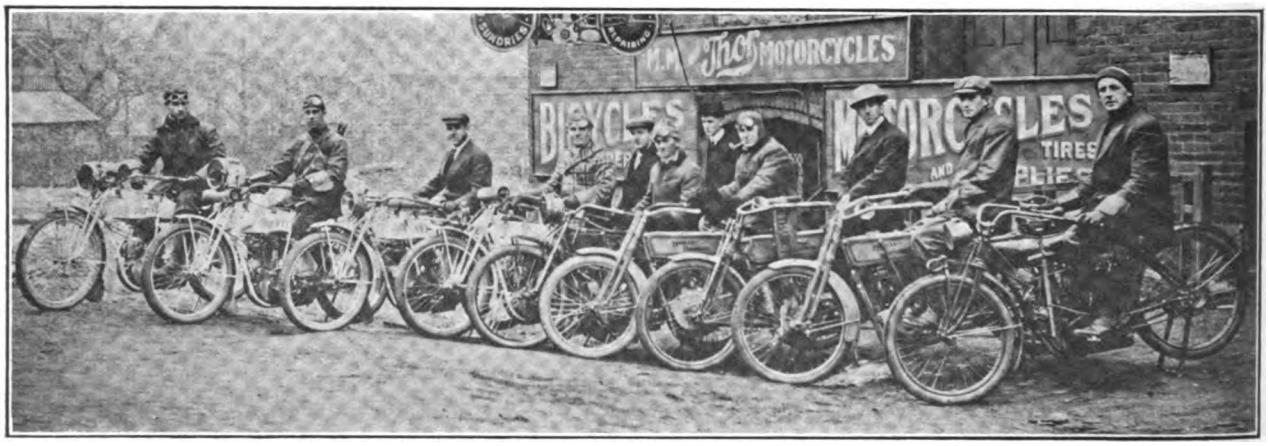
IN THE REALM OF THE MOTORCYCLIST.

Another Plan to Redistrict F. A. M. So That All Sections May Be Represented on the Board of Directors---General News of the Industry and the Clubs.

DIRECTOR J. Leo Sauer of New York, chairman of the legal action committee of the F. A. M., has presented his official resignation from the directorate to take effect at the annual convention at Denver, Col. His term does not expire until August, 1914, but he is willing to retire a year in advance in order that certain measures may be carried through which he believes will benefit the organization as a whole.



Mr. Sauer, as a result of his recent trip to the Pacific Coast, when the differences between the F. A. M. and W. F. M. were settled, will introduce a by-law at the general session at Denver which will provide for territorial distribution of the directorate. The latter then would consist of nine members, including the president, the preceding ex-president and seven other directors to represent respective divisions. At present there is another director in New York City besides Mr. Sauer and his resignation is offered to open the way for a single director to represent a territory to be known as the Atlantic district, at the same time making easy the transfer of a second director to the Pacific Coast to represent a new district in that section. The amendment to the constitution contemplates the following districts: Pacific Northwest, Pacific Southwest, Rocky Mountain-Mississippi River, Middle West, South, Atlantic and New England.

Ten Win in New Jersey.

Ten of the 17 starters in the recent annual spring run of the North Jersey Motorcycle Club of Paterson, N. J., over a course of 143 miles, were the recipients of prizes. The order of the winners and their scores follows: Everett M. Young, Indian, 941.5; Thomas K. Lee, Thor, 938; Harvey Snyder, Indian, 937.5; Harry Eike, Thor, 890.5; John Kop, Indian, 874; Charles Van Way, Indian, 870; Dr. C. O. Regener, Indian, 857.5; Frank Hunter, Harley-Davidson, 855; L. M. Axford, Harley-Davidson, 854; John Steele, Indian, 849.

Minneapolis Police Modify Order.

A committee representing the motorcycle riders of Minneapolis, Minn., recently visited the chief of police and as the result of a conference an order issued by the police department forbidding the carrying of passengers on motorcycles has been modified to permit tandem riding. The previous ruling of the police chief absolutely prohibited even the carrying of a passenger on a tandem seat.

Thor and Harley-Davidson Riders in Worcester, Mass.: Left to Right, Flint, Goodwin, Orcutt, Zickell, Swenson, Beaudin, Dounker, Tannebring, White, Livingstone.

Yale in Business Life.

Motorcycles have been found very effective in certain lines of business and many firms are using them for quick delivery of parcels and in the taking of orders for goods. The King County Lighting Company, New York City, has a Yale, with tandem and sidecar, made by the Consolidated Manufacturing Company, Toledo, O. The machine is driven by a gas meter mechanic, while his helper rides the tandem and meters are carried in the sidevan. The machine is also used at times for employees to make their routes to

Digitized by Google

read meters. A number of wholesale salesmen also utilize Yale machines, among them being Clarence Harrman, coffee salesman; John Siemson, milk; Joseph O'Brien, lace goods; Julius Horn, wholesale butcher; Frederick Rothschild, wholesale butcher; Benjamin Huerlander, wholesale ice salesman.

Free Sanctions for State Meets.

The following resolution has been passed by the competition committee of the Federation of American Motorcyclists, and such sanctions will be issued free of charge with the understanding that the proceeds are to be turned in by the state commissioner to the national treasury to his account and drawn from for F. A. M. expenses:

Resolved, That the chairman of the competition committee be, and is hereby, authorized to grant sanctions free of charge for all competitive events held in direct connection with an annual F. A. M. state convention. Application for such free sanctions shall be made by an authorized state official or state committee, who shall demonstrate to the satisfaction of said chairman that said sanctions are desired for an endurance run, race meet or other competitive event which is part of a programme including the regular annual state F. A. M. convention. Such sanctions shall be granted not more than once a year in each state and may be for an endurance run, race meet, or both.

New Local Commissioners.

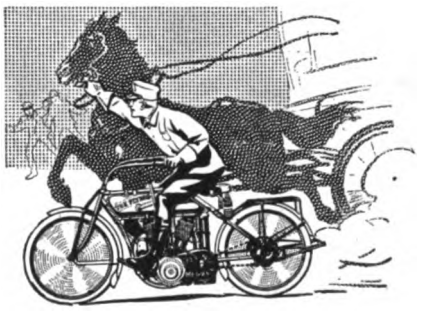
The following local commissioners of the F. A. M. have been appointed by the state commissioners: John W. Treat, 29 Palm street, Bangor, Me.; August Ansback, 132 Market street, Louisville, Ky.; Charles Baumeister, Pewee Valley, Ky.; R. K. Judy, Middlesboro, Ky.; B. C. Ogden, 302 East Central avenue, Ashland, Ky.; Henry F. Pardon, Third street, Owensboro, Ky.; Joseph Wandstradt, 26 East Tenth street, Covington, Ky.; G. T. Washington, Russell, Ky.; E. W. Willock, Campbellsville, Ky.; G. R. Moses, 760 Bayard avenue, St. Louis, Mo. Glenn S. Dirlam, Freemont, O., has been appointed state commissioner for Ohio.

Additional Registered Repair Shops.

New repair shops registered with the F. A. M. include the following: Miles McIntyre, 604 South Sixth street, Grants Pass, Ore.; George G. Hayden, Bond street and Bangs avenue, Asbury Park, N. J.; J. W. McGee, 22 West Second street, Tulsa, Okla.

Massachusetts Rules Against Sidecars.

The motorcycle riders of Massachusetts are confronted with a peculiar situation regarding the use of sidecars. The Massachusetts highway commission has made a ruling that the addition of a side or forecar to a motorcycle changes its legal status and that its owner must take out an individual and motor vehicle license before he can legally operate the same on the highways. Secretary Gibson of the F. A. M. has written to the commission, which has decided that this ruling holds good for this calendar year. It is hoped to change this condition at the next session of the legislature and it is also possible that a test case will be brought in the courts.



To Celebrate Tenth Birthday.

Plans are being considered for the celebration of the 10th anniversary of the birth of the F. A. M., to be held on a date in September to be selected later, in the city of its founding, Brooklyn, N. Y. Secretary-Treasurer Gibson and other charter members of the organization approve of the idea and there promises to be a large gathering of old time motorcyclists. State Commissioner J. A. Hall of New York has the matter temporarily in charge.

Kirk with Thor Maker.

H. N. Kirk, one of the most prominent men of the bicycle and motorcycle industries in this country and for almost 20 years connected with the Excelsior Supply Company, later the Excelsior Motor Manufacturing & Supply Company, Chicago, has left the service of that concern. June 1 he took charge of the sales department of the Aurora Automatic Machinery Company, Chicago, producer of the Thor motorcycle.

Mr. Kirk will greatly strengthen the Thor

ALWAYS READY FOR ANY EMERGENCY!

With its ability to pick up speed quickly—(60 miles an hour from a standing start within a city block)—the 1918 Flying Merkel Motorcycle is always ready for instantaneous use. These features and the fact that the Flying Merkel Motorcycle is the most economical in the world to operate has led to its universal adoption by Police Departments, Park Boards, Gas Companies, Telephone and Electric Light Companies and all other business concerns and individuals whose requirements demand a sturdy, reliable motorcycle at the minimum cost of upkeep. Remember, the Flying Merkel

"Made Its Name on Merkel Mileage."

Lincoln R. Arnold, Providence, R. I., and His Latest Excelsior Mount.

force and will establish an efficient and capable selling staff which will be able to handle the increased output of the company the next year. His appointment carries out the firm's policy of development inaugurated with the decision to transfer the motorcycle department to larger and more appropriate quarters.

His Second Excelsior Mount.

An accompanying illustration presents Lincoln R. Arnold, son of George C. Arnold, treasurer of the Motor League of Rhode Island, on his Excelsior mount in front of the Worcester Polytechnic Institute, Worcester, Mass., where he is a student in the class of 1916. Young Arnold finds his machine of decided value in furnishing opportunity for getting into the country. He frequently makes week-end trips to his home in Providence, R. I., and often covers the triangle between Worcester, Providence and Boston. This is the second Excelsior he has owned, the first having been purchased through Hirah G. Baxter, the Providence agent, while the 1913 model was secured through the New England Motor & Supply Company, Boston.

Lower Rate on Sidecars.

C. R. Rogers, manufacturer of the Rogers sidecar, which is handled by the Aermore Manufacturing Company, Chicago, has announced that the railroads in the western classification territory have granted a lower freight rate for the shipment of sidecars as the result of a conference which Mr. Rogers held recently with the railroad officials. He represented at the conference the Greyhound, Angsten-Koch and Anders sidecars, in addition to his own interests. Previously the rate has been 2.5 times the first class rate. In future when shipped unassembled and crated, the rate will be twice the first class rate. They also will be allowed to be mixed with motorcycles in carload lots, when the rate will be 1.5 times the first class rate. When shipped separately in carload lots the rate will be at the first class rating.

Spencer Defeats Gove.

The big event at Taunton, Mass., Memorial Day, was the 15-mile professional motorcycle race held under the direction of the Taunton Gentlemen's Driving Club. It was won by William B. Spencer of Attleboro, Mass., although Earl Gove of Brockton, Mass., who had been defeated previously but once since he started racing, was second. Spencer finished about 30 yards ahead of Gove and at no time throughout the entire distance were the riders more than that distance apart. The time was 19:20.2. Cunhar and Guilmet were third and fourth respectively. Spencer made all his gains at the turns, when he let his machine out, while Gove speeded on the stretches and slowed down at the turns.

Long Distance Emblem Run.

H. E. Gale, accompanied by Willard Hudson, recently left the factory of the Emblem Manufacturing Company, Angola, N. Y., maker of Emblem motorcycles, riding a 1913 model, 10 horsepower twin fitted with the Gale sociable seat, which permits the riders to ride side by side, for a run to Boston. The start at Angola was made on Thursday afternoon and Friday morning at 11 they arrived at Boston after riding 19 hours,

Mr. and Mrs. H. E. Gale and an Emblem Mount Fitted with Gale Sociable Seat.

Digitized by Google

during which time no mechanical or other trouble was encountered.

The distance covered was nearly 600 miles. Mr. Gale weighs about 180 pounds and his passenger between 180 and 190. Part of the journey was through a severe rain storm, which put the roads in bad condition in spots. The performance of the Emblem machine is a most notable one and one which reflects credit upon its manufacturer.

New York Convention in July.

It has been decided that the annual state convention of the New York F. A. M. will be held this year at Elmira, N. Y., on July 4, 5 and 6, which includes a holiday, Saturday and Sunday. There will undoubtedly be a large attendance and an elaborate programme will be arranged.

Race Dates in Cleveland.

The Luna Park Amusement Company, Cleveland, O., has received sanctions to conduct series of races during the weeks of June 15, 22 and 29.

Can't Get Merkels Fast Enough.

F. J. Barr, shown in the accompanying illustration, is one of the most progressive distributors of Flying Merkel motorcycles in the country. He has as his territory the State of Iowa and was the source of some embarrassment to the maker, the Miami Cycle & Manufacturing Company, Middletown, O., because of his energetic sales campaign in that district. The company is authority for the statement that Mr. Barr could easily have sold 1500 machines in Iowa this season, but because of the press of orders from other parts of the country he could not be supplied with the necessary number. With the constantly increasing size of the Merkel plant this difficulty will soon be overcome and the production will be increased sufficiently to meet all demands, such as those made by Mr. Barr.

Enjoy Sidecar Trip.

Mr. and Mrs. J. W. Newton of Fall River, Mass., recently enjoyed a trip from that city to Monson, Mass., and return, on an Excelsior motorcycle, equipped with a De Luxe sidecar. The distance was 210 miles and included the famous Leicester hill at Leicester, Mass. Mr. and Mrs. Newton started at 4:30 in the morning and arrived back at Fall River at 7:45 in the evening.

Club Notes, Here and There.

Members of the Worcester Motorcycle Club, Worcester, Mass., recently held a pleasure run to Springfield, Mass., 35 persons enjoying the journey. After luncheon the motorcyclists went to the Springfield driving park, where their machines were tried out and a number of impromptu races were held.

The St. Peter Motorcycle Club has been formed at St. Peter, Minn., and a number of trips through southern Minnesota are being planned for the summer.

A number of club runs have been arranged for the next few months by the members of the Fremont Motorcycle Club, Fremont, O. Port Clinton, Lakeside, Marblehead and Toledo will be included in the list.

At a meeting of 25 motorcycle riders at Bucyrus, O., the Bucyrus Motorcycle Club was formed and a number of club runs and race meets will be arranged during the summer. The officers elected follow: President, J. E. Swank; secretary, Robert Carroll; treasurer, Claude D. Keel, President Swank is also road captain.

Interior of Salesroom Maintained by F. J. Barr, Iowa Distributor for Flying Merkels.

The Vancouver Motorcycle Club is planning to organize a motorcycle polo team in the near future.

The Yavapai Motorcycle Club, Prescott, Ariz., held a tandem party and picnic on Memorial Day at the American ranch, 12 miles distant. The ranch is directly back of Granite mountain and is said to be a most excellent spot for an out-of-door rendezvous.

The Four Lakes Motorcycle Club of Madison, Wis., recently held its annual spring run or "mud plug," to Columbus and return. All the riders made the trip on time.

The Grady County Motorcycle Club, Chickasaw, Okla., was formed recently and the first run was held over 65 miles of prairie roads among the surrounding towns. About 25 members took part and it was the initial event of its kind held in that territory.

1913 F. N. SHAFT-DRIVE MOTORCYCLES.

Lightweight Single, with Two-Speed Gear $275
Only Machine Built With Handle Bar Control of Clutch.
Four-Cylinder $300

NEWS OF THE MANUFACTURER AND DEALER.

The following concerns have been incorporated recently to manufacture or deal in automobiles, accessories, supplies, etc.:

Consolidated Gas & Gasoline Engine Company, Wyandanch, N. Y.; $15,000; G. H. Scanlan, F. B. Knowlton, E. J. Forhan.

International Automobile School, San Antonio, Tex.; $4000; T. P. Price, G. Leroy, J. A. Kerr.

Fulton-Post Company, New York City; $1000; R. H. Post, W. H. Fulton, L. M. Dietrich.

D. W. Baldwin & Son, New Haven, Conn.; $20,000; H. D. Baldwin, M. A. Baldwin, C. T. Baldwin.

Motor Compressor Company, New York City; $10,000; to manufacture motors; G. J. Spohrer, C. E. Van Vleck, R. L. Redfield.

Carbon-Oxygen Gas Engine Company, Boston, Mass.; $500,000; A. H. Rhodes, A. P. French, W. Falletly.

Lil's Motors Company, Brooklyn, N. Y.; $4000; T. J. Qualey, E. McDonald, G. H. Wendling.

M-A-Z Concealed Hinge Company, Kenosha, Wis.; $10,000; H. M. Mink, E. Anderson, J. P. Zens.

Shinauto Manufacturing Company, Indianapolis, Ind.; $10,000; to make motor car polishes and soaps; W. L. Bedford, J. C. Sharp, M. A. Seligman.

Buffalo Automobile Spring Company, Buffalo, N. Y.; $10,000; E. Plantz, W. E. Slater, H. Etlinger.

Ferns Motor Delivery, Chicago, Ill.; $50,000; M. M. Franey, A. J. Goldine, H. P. Mumms.

Philippart Motor Car Company, Detroit, Mich.; $2000; to manufacture engines and accessories.

Barber Auto Service Company, Brooklyn, N. Y.; $10,000; William Barber, A. S. Barber, M. F. Barber.

Allen Breed Tractor Company, Cincinnati, O.; $5000; Allen Brede, L. J. Dolle, H. V. Reedy.

E-Z Auto Tire Pump Company, Wilmington, Del.; $20,000; F. D. Buck, G. W. Dillman, B. M. Grawl.

New Idea Tire Company, Philadelphia, Penn.; $500,000; F. R. Hansell, G. H. B. Martin, S. C. Seymour.

Porto Metal House & Garage Company, Milwaukee, Wis.; to manufacture portable steel structures for automobile storage and outing purposes; J. E. Tracy, P. G. Meyer, J. P. Weber.

Oakes Pressed Steel Company, Indianapolis, Ind.; W. H. Oakes, W. D. Oakes, C. G. Swenson.

Dreadnought Tire & Rubber Company, Baltimore, Md.; $1,000,000 A. F. Gilbert, Wilmer Dunbar, W. E. Hill, C. P. Tiplett, W. B. Swindell, Sr., A. A. Adt, R. H. Diggs, H. E. Whitelock, A. B. Whitelock, G. H. Rice.

Holland Flexible Auto Wheel Company, Cleveland, O.; $10,000; J. L. Dunahue, J. E. McKenna.

Grant Motor Company, Detroit, Mich.; $100,000; to manufacture cyclecars; G. D. Grant, C. A. Grant, David Shaw, G. F. Salzman, J. M. Howe.

Haupt Company, Cleveland, O.; $5000; W. D. Haupt, H. A. Couse, R. G. Curren, Mary McManus, Alfred Clum.

Pittsburg Haynes Automobile Company, Pittsburg, Penn.; $10,000; H. S. Morrow, E. K. Morrow, Alva Hughson.

H. G. Borbein & Co., St. Louis, Mo.; $10,000; H. G. Borbein, L. W. Becker, L. B. Borbein.

Service Boat & Engine Company, Syracuse, N. Y.; $10,000; to deal in motors; W. J. Eastman, L. J. Rolfsen, C. L. Ripley.

Electromobile Company, Wilmington, Del.; $100,000; to manufacture electric automobiles; H. E. Latter, W. J. Maloney, O. J. Reichard.

WITH THE MANUFACTURERS.

The Essenkay Products Company, 1125-29 West Thirty-seventh street, Chicago, announces that it has acquired the copyrights, trade marks, patents and good will of the Essenkay Company, as well as the exclusive right to manufacture and sell Essenkay. The plan of establishing general agencies has also been changed, so as to permit all supply houses and garages to sell and install Essenkay. The company is composed of F. D. Mayer, William B. Russell and William L. Weber.

The Fedders Manufacturing Company, Buffalo, N. Y., has been incorporated with $400,000 capital stock and the certificate of incorporation has been filed with the county clerk. The concern will manufacture and sell automobile radiators and other sheet metal specialties. The directors are given as Theodore C. Fedders, Christian W. Fedders, John M. Fedders and Louis F. Fedders, all of Buffalo.

The Knox Automobile Company, Springfield, Mass., maker of Knox machines, is to transform its representation at Boston from an agency to a branch office, which will be in charge of Frank B. Crockett, who was formerly connected with the Underhill Company in that city, the Boston agent for the Knox company since 1901.

W. B. Jameson, who has been with the Maxwell-Briscoe Motor Company since 1904, has resigned his connection with the Maxwell Motor Company, Inc., which succeeded the United States Motor Company, of which corporation the Maxwell-Briscoe Motor Company was a part. Mr. Jameson, who has received a number of excellent offers of positions since it became known he was available, has not yet decided which line of work he will take up.

H. B. Willower, who has for the past two years represented the Gramm Motor Truck Company, Lima, O., maker of Gramm trucks, throughout Illinois, Indiana, Kentucky and Michigan, has joined the sales staff of the Gramm-Bernstein Company, Lima, maker of Gramm-Bernstein trucks. Mr. Willower is one of the most successful salesmen in the motor truck field.

Glenn W. Barden has been appointed secretary and treasurer of the Kelly-Springfield Motor Truck Company, Springfield, O., maker of Kelly trucks. He was formerly auditor of the Warren Motor Car Company, Detroit, maker of Warren cars.

The Palmer-Meyer Motor Car Company, St. Louis, Mo., maker of Palmer trucks, has appointed the following agents: Louis Schnellman, Luxemburg, Mo.; Henry J. Jenneman, Mattese, Mo.; C. J. Siedler, Maxwell, Mo.

The Henderson Motor Car Company, Indianapolis, Ind., maker of Henderson cars, announces the following distributors, recently appointed: J. A. Tucker, Huntington, W. Va.; F. Q. Berdine, Hundred, W. Va.; L. Casselman, Jr., Richmond, Va.; Automobile Repair Company, Charleston, S. C.; W. E. Warters, Cleveland, O.; Frank Burgor, Little Falls, N. Y.; M. Walsh, Niagara Falls, N. Y.; M. H. Callahan, Huntsville, Mo.; A-B Stove Company, Battle Creek, Mich.; W. T. Bradway, Richmond, Ind.; H. L. Beach, Waukegan, Ill.; Amsberry & Hennless, Oskaloosa, Ia.

The Crown Motor Car Company, Louisville, Ky., capitalized at $500,000, has begun the manufacture of automobiles at its factory at 121 North Third street. B. F. Lambert, Anderson, Ky., is president; A. B. Lambert, Louisville, vice president, and C. H. Lambert, Louisville, secretary of the new concern.

GARAGE AND DEALER.

The Pacific KisselKar Branch is having plans drawn and will soon break ground for a new sales and service building to be located on Van Ness avenue, San Francisco, Cal. It is intended to erect a structure that will eclipse in size and completeness the big Kissel service station in Chicago, which contains 70,000 square feet of floor space.

L. S. Crane, Atlanta, Ga., announces the removal of his business to 328 Peachtree street, where will be carried a complete line of Pope-Hartford automobiles, motorcycles, bicycles, lubricants, etc.

J. R. Bradford has taken a position on the sales force of the M-B-M Company, Boston, distributor of the Maxwell line. He resigned recently from another company after five years as its assistant manager.

J. W. Paddon, proprietor of the Paddon Motor Company, 293 Northampton street, Boston, has contracted for a modern concrete garage, which is being erected at Eggleston square, Roxbury district. It will be completed and open for business by July 1 and will contain 28,500 square feet of floor space. In addition to a handsome suite of offices the structure will contain a modern machine and repair shop fully equipped, large stock room and chauffeur's room. There will be two entrances on Washington street, two on Columbus avenue and one on West Walnut park. The new garage is located on the main highways to Providence, R. I., and Cape Cod.

Frederick D. Markee has resigned his position with the Oakland Motor Company, Boston, with which concern he has been identified for the past three years. He

Digitized by Google

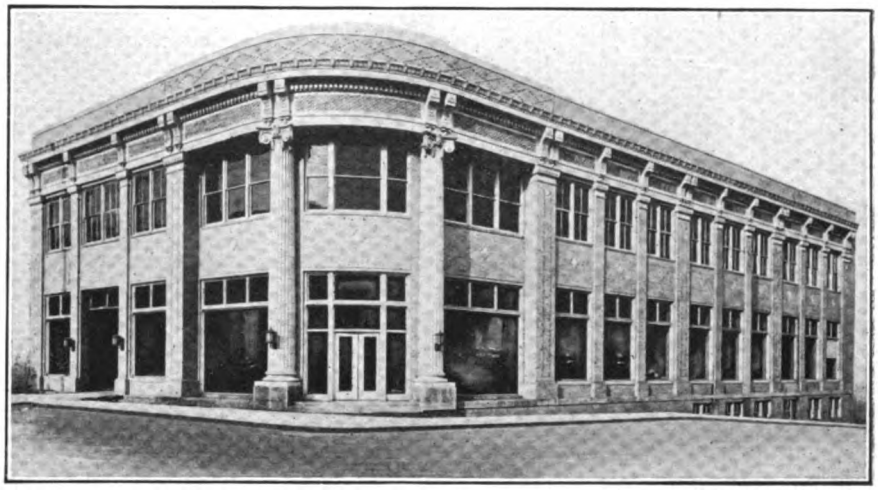
is now connected with the M-B-M Company, agent for the Maxwell pleasure cars and the Hercules trucks.

F. S. Cheesborough, Augusta, Ga., recently opened a new garage and automobile repair shop at 548 Broad street.

The Co-Operative Garage, Toledo, O., has opened for business at 318 Columbia street. The plant is completely equipped.

Matthew Kacjenhausen, Jr., White Bear, Minn., has opened a new garage and repair shop on Banning avenue.

Kershner & Conn, Richmond, Cal., has opened a new garage on Seventh street, north of Macdonald avenue.



J. J. Laverty, New Haven, Conn., has leased the Bradford garage at 400 Crown street. The plant is modern and well equipped and Mr. Laverty will make a specialty of Moon cars, made by the Moon Motor Car Company, St. Louis, Mo.

The East Nashville Auto Company, East Nashville, Tenn., has opened a large and handsomely equipped garage at 112 Woodland street, with a capacity of housing 200 cars. The Regal cars, made by the Regal Motor Car Company, Detroit, will be carried.

The Co-Operative Used Car Company, New York City, has moved into new and commodious quarters at 1700 Broadway.

The Catskill Automobile Company, Catskill, N. Y., has started work for a large extension to the company's plant, to be used for the storage of automobiles. The entrance will be on Main street.

The White Company, Pittsburg, Penn., a factory branch of the White Company, Cleveland, O., maker of White cars and trucks, has recently completed and occupied its new salesroom and service station at the corner of Craig street and Baum boulevard. The structure is shown in an accompanying illustration and is something of an innovation, in that it is built on the side of a hill and is so designed that vehicles may enter from the street level both in the basement and the main floor. Each floor has 15,000 square feet of space, the basement being devoted to housing heavy trucks and for storage purposes, the first floor to salesroom and offices and the second to the repair department, machine shop and stock rooms. More than $75,000 worth of repair parts are carried in stock and 50 people are employed.

New Salesroom and Service Station of the White Company in Pittsburg, Penn.

The Thomas Motor Company, Lima, agent for the Cole car, made by the Cole Motor Car Company, Indianapolis, Ind., and **E. H. Hawisher,** agent for Studebaker machines, made by the Studebaker Corporation, Detroit, are completing negotiations for the erection of a two-story fireproof building at 302-304 South Main street. They are at present housed at 305 Market street, which building they erected and have occupied the past year. The large growth of their business forces the change. Mr. Hawisher will continue to confine his energies to the sale of Studebaker cars, while J. F. Thomas will operate the garage and service station for the Cole.

The Grady Rousche Motor Car Company, Salt Lake City, Utah, has opened for business at 473-475 South Main street. The company will feature Reo cars, made by the Reo Motor Car Company, Lansing, Mich., and will carry a full line of parts and the necessary shop equipment.

The Klinger Company, Pittsburg, Penn., distributor of Imperial cars, made by the Imperial Automobile Company, Jackson, Mich., is now occupying new quarters at 416 North Craig street.

Loomis McA. Goodwin of the Raleigh Motor Car & Machine Company, Raleigh, N. C., will open a new service department in charge of R. J. Cannon.

The Standard Motor Company, 16 West Mount Royal avenue, Baltimore, Md., has purchased property at 1017 North Eutaw street, where a large and modern garage will be established.

Mrs. J. F. Eames of 159 West One Hundred and Twenty-seventh street, New York City, has plans and a permit for an addition to a garage at One Hundred and Twenty-seventh street and Seventh avenue, to cost $15,000.

J. J. Egan of 118 East Twenty-ninth street, New York City, has plans for a new garage to be erected on Thirty-ninth street, near Third avenue, to cost $35,000.

The United States Garage Company, Toledo, O., is to occupy the ground floor of the Meredith building at Jefferson avenue and Michigan street. A general garage business will be conducted under the firm name of the City garage.

The Chase & Burkett Garage, 728 Commercial street, Emporia, Kan., is to have an addition, to be used as a repair shop.

The New York Sales Company, Binghamton, N. Y., has erected a new garage at 34 State street, costing $35,000. It is modern in every particular.

Frank Fairweather, Chattanooga, Tenn., has purchased the property at 123-125 Main street. He will remodel the building and move his automobile establishment into it from Seventh and Chestnut streets.

The Electric Service Company, Indianapolis, Ind., under the management of T. H. Watts and W. C. Brooks, has opened a new electric service station at Meriden and Walnut streets. It is claimed to be the first exclusive electric garage and service station in the state.

Klemer Bros., Owatonna, Minn., has leased the new garage building on West Bridge street.

J. E. Smith, Clovie, N. M., has purchased a garage on West Grand avenue and will conduct the business under the firm name of the Clovie garage.

Bryden & Shanks, Brewley, Cal., is planning an addition to the firm's garage to care for increasing business.

R. L. Dalzell, San Bernardino, Cal., has purchased the Highland garage of Lavering & True, and is operating the business.

The White Garage Company, Santa Paula, Cal., has changed hands, Spicer & Winsor having taken over the business.

R. W. Rayhill, San Francisco, Cal., is to erect a large garage at 645 Haight street.

J. W. Norcross, Springfield, Mass., is to erect an addition to his garage on Bridge street, to cost about $30,000. This addition will make it one of the largest garages in Western Massachusetts and will afford excellent facilities for handling increased business.

The Riddell Automobile Company, Fourth and Grand streets, Des Moines, Ia., distributor of Overland cars, made by the Willys-Overland Company, Toledo, O., on June 1 changed its name to that of the Clemens Automobile Company. There will be no change in the management and the stockholders will remain the same as for the past four years. A. Clemens is president, R. J. Clemens is secretary and manager and M. M. Hamilton is treasurer.

The Delameter Byrnes Company, New York City, has moved to larger quarters at 1677 Broadway.

The Raabe Bros., Butler, Penn., has opened its new garage and repair shop on North East Diamond square.

RECENT PATENTS.

Piston Packing Ring, Norbert Danes Hamel, Gardner, Mass., No. 1,062,095. The combination with a split piston ring whose ends are recessed in both edges; of a reinforcing member channelled at one end with the base of the channel fitting inside one ring-end and the flanges thereof fitting in its recesses and adapted to slide into the recesses of the other ring-end, the base of said channel being longitudinally slotted, and a screw inside the other ring-end engaging said slot.

Muffler, Orville Z. Frazier, Elkhart, Ind., No. 1,062,092. A muffler comprising a main casing, a plurality of chambers arranged therein, said chambers being graduated in size and having the upper edges thereof in the same horizontal plane as the upper edges of the side and end walls of said main casing, communicating means between said chambers and the main casing, means to supply exhaust gases to the smallest chamber, and discharge pipes leading from said main casing.

Alarm for Tires, Henry Edward Knies, White Haven, Penn., No. 1,061,184. In a device for indicating tire failure, a supporting structure; a charge holder carried thereby; a firing member in the supporting structure movable toward and away from the charge holder; a latch movable in the firing member transversely of the line of movement of the firing member, the latch and the firing member being provided with interchanging elements, limiting the movement of the latch; means for actuating the latch; a gear movable in the supporting structure, into and out of the path of the latch; and means for advancing the firing member toward the charge holder.

Adjustable Alligator Wrench, Henry Adalbert Smith, Elgin, Ill., No. 1,062,047. In a wrench, the combination of a fixed jaw, a pivoted jaw, a handle having a recess in its forward end back of said pivoted jaw, a spring one end of which engages said pivoted jaw and tends to open the same and the other end of which spring is bent upon itself and sprung into the recess in the handle, means for closing the pivoted jaw against the tension of said spring, means for engaging the spring intermediate its ends during part of the movement of the pivoted jaw whereby said jaw is held under two different tensions during its movement, said means comprising an abutment formed by the extremity of the bent over portion of the spring, and a saddle attached to the fixed jaw and incasing the devices for operating the pivoted jaw.

Inner Tube Valve, John S. Harper, Youngstown, O., No. 1,061,069. An inner tube valve comprising a casing adapted for attachment to a wheel rim, said casing having one end open and provided with a counterbore, the main bore of the casing terminating at a point intermediate of the ends of the casing, and the casing being provided with a reduced bore extending from the inner end of the main bore to the end of the casing, the face of the main bore being provided with a plurality of feed grooves, a valve having a cushion head and a stem slidable in the reduced bore, the inner end of the main bore forming a valve seat, the upper end of the valve stem being slotted, a transverse retaining member engaged in the wall of the casing and passing through said slot and a stop pivoted to the top of the stem to close the slot and thus prevent displacement of the valve when air is forced inwardly through the same.

Silencer for Gas Engines, Hiram Percy Maxim, Hartford, Conn., No. 1,060,925. A silencer for gas engines and the like comprising a reversely directed, eccentrically arranged, nested series of wide cylindro-spiral shells having slightly lapping ends and forming compound series of wide alternately reversing spiral whirl chambers, each gradually expanding radially from its admission end and gradually contracting towards its constricted discharge throat, each discharge throat being angularly advanced in its discharging direction beyond the admission end of the succeeding outer chamber receiving material therefrom, the final outer whirl chambers having corrugated or roughened walls and a progressively greater cross section than the preceding chambers, a casing within which said shells are arranged, grooved supports in which said shells and casings are mounted and provided with admission and discharge connections suitable for exhaust gases and for cooling fluid, said supports comprising an independently adjustable intermediate support within said casing for one end of each said shells and connecting means co-operating with said supports.

Tarvia

Preserves Roads
Prevents Dust~

Bard Avenue, West Brighton, Staten Island N. Y. Road treated with "Tarvia B".

Of Interest to Taxpayers

A CLOUD of dust behind an automobile means that the road surface is being destroyed—blown away. It also means that the road is unfit for modern traffic—that it has been built in the old way intended for slow-moving, horse-drawn traffic.

The science of MacAdam has been rewritten these last few years. A mineral binder is no longer enough to hold the stone together.

Something stronger is needed, and the use of Tarvia is the logical and necessary answer to a difficult problem.

In the tarviated road, there is a matrix of Tarvia around each stone, holding it firmly to its work and preventing it from shifting. There is no internal movement, and the attrition of traffic is reduced to a minimum.

If the road is built of Tarvia the extra cost of the treatment is more than made up in longer life and reduced maintenance cost.

There are three kinds of Tarvia—"Tarvia X" for road and pavement construction, "Tarvia A" for surface work and "Tarvia B" for dust suppression and road preservation. The first two are very dense and viscid and require heat for application. "Tarvia B" is applied cold.

Booklets on request.

BECOMES GENERAL MANAGER.

J. C. Manternach Wins Deserved Promotion—Other Standard Welding Company Changes.

J. C. Manternach has been promoted from sales manager to the position of general manager of the Standard Welding Company. He was appointed sales manager in 1910 by the late W. S. Gorton and his present advancement comes as a recognition of the work he has performed in that position. Mr. Manternach began his career with the Pope Manufacturing Company, Hartford, Conn., in 1897, and later joined the forces of the Shelby Steel Tube Company and the National Tube Company, a subsidiary of the United States Steel Corporation.

Mr. Manternach announces the appointment of S. W. Hartley to the position of sales manager, he having been assistant sales manager for the past two years. He formerly was identified with the Peerless Motor Car Company, Cleveland, O.; the Garford Company, Elyria, O., and the A. O. Smith Company of Milwaukee, Wis. R. S. Bryant, who is the originator of the types of rims now being made and sold by the Standard Welding Company, is consulting engineer, and C. C. Gressle is made superintendent. Mr. Gressle has been with the Standard Welding Company since its inception, 15 years ago.

HOPEWELL WINS

Notice to the Trade

We have won our patent suit against the Linscott Supply Company for selling spiral spring tire covers manufactured by the Vehicle Apron & Hood Co. of Columbus, Ohio, who defended the suit. These covers have been held to infringe the Hopewell patents.

We wish to warn the trade against buying, selling or having in stock spiral spring tire covers infringing our patents as we intend to fully protect our rights.

We wish to thank those who have stood by us.

HOPEWELL BROS.
Newton, Mass.

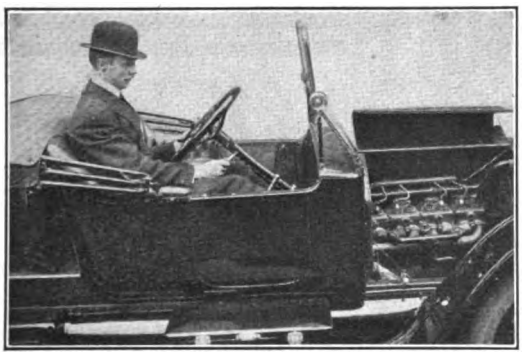
MULFORD'S BRAENDER TIRES.

How the Shoes That Withstood 500 Miles of Speedway Racing Are Made.

Since it became known that the four Braender tires, made by the Braender Rubber & Tire Company, Rutherford, N. J., and fitted to Ralph Mulford's Mercedes in the 500-mile race on the Indianapolis motor speedway, Memorial Day, went through the entire contest without change, there has been decided interest in this product.

Braender tires are made by the single cure, wrapped tread process, from the highest grade Para rubber and the best combed Sea Island fabric. The single cure tire differs from others in that the mold protrudes only one-third of the distance from the beads, the maker maintaining that this permits the cloth wrapper to compress the tire properly without buckling. The product is manufactured by experienced workmen in a well lighted, modern plant, and each tire is carefully inspected before leaving the factory.



HOPEWELL BROS. WINS.

Result in Action for Alleged Infringement of Tire Case Patent.

Judge Dodge of the United States district court in Boston has decided in favor of the Hopewell Bros., Newton, Mass., in an action brought by C. F. Hopewell against the Linscott Supply Company, involving the determination of the validity of the patent known as the Hopewell tire case patent, and the improvement thereon, or the Kinder tire case patent. The tire cases sold by the Linscott concern were made by the Vehicle Apron & Hood Company, Columbus, O., which defended the suit.

Hopewell Bros. maintained that the first three claims of the Hopewell patent and all the claims of the Kinder patents were infringed. Judge Dodge held that there was no anticipation of the Hopewell patent shown in prior art, although the Vehicle Hood & Apron Company tried to anticipate. He also said that he could not consider such evidence as sufficient and found against the defendant on both these facts.

Ask the Man Who Owns One.

GET YOUR GASOLINE AT HALF PRICE.

By using the M&M Economizer.

WHAT YOU CAN DO WITH THE M&M ECONOMIZER!

YOU can save from 40 to 50% of gasoline. YOU can obtain 20% more speed and power than you can without it. YOU can develop more power in high altitudes. YOU can keep the cylinders clean and cool your engine at all times. YOU can use the M&M just like the coaster brake on a bicycle. YOU can use it as an air brake in descending grades, at the same time taking off the ignition. YOU can save wear and tear on clutch brakes and tires. YOU can immediately secure the proper mixture for different weather conditions without readjusting your carburetor. YOU can set your throttle at 12 miles per hour, and increase your speed and power to 18 or 20 miles, with the same amount of gasoline, and less carbon, simply by opening the M&M Economizer.

Pat. Europe Pat. America

Showing M&M Attached with ½" Elbow.

The M&M is nickel plated and highly polished. It is made with one ground valve and six portholes, which when open, admit auxiliary air into the manifold. The gas coming from the carburetor is broken up and sprayed by the incoming air, so that when it reaches the cylinders it is a gas of the **greatest explosive power.**

READ WHAT A MITCHELL OWNER SAYS ABOUT THE M&M!

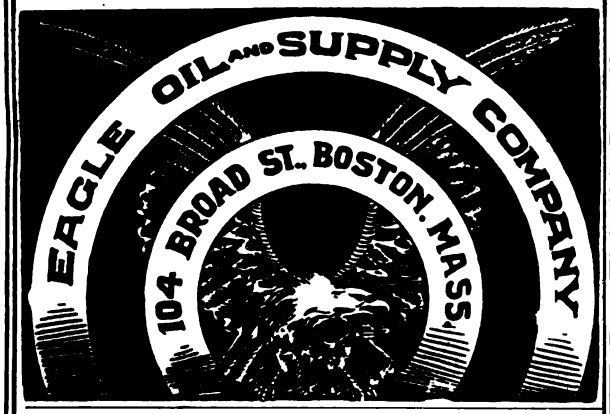
Moller Bros., Philadelphia, Penn. Watertown, S. D., May 29, 1913.

Gentlemen:—I have had the M&M Economizer installed on my 1910 Model T 35 h. p. Mitchell Touring Car, and I am very much pleased with it. It does all you claim for it in saving gasoline, and also gives more speed and power. It also saves clutch and brakes, and, in fact, it is the finest attachment I have ever seen.

Yours very truly, WM. F. UTHE. (Signed)

The automobile attachment requires a ¾" pipe tap to insert into manifold, but same can be reduced to ½" by means of an elbow or a common reducer. It is controlled either by friction foot pedal, or steering post control, which includes flexible shaft and wire. The motorcycle size is ¼".

OUR GUARANTEE.



WE POSITIVELY guarantee the M&M to do just what we claim, or money will be refunded in 30 days. (Reference—Citizens National Bank, Lewistown, Penn.) No dealer or jobber is authorized to sell without giving our guarantee.

Price of Automobile size—$3.50 and 17c extra for postage. Price of Motorcycle size—$1.25 prepaid.

SEND FOR OUR CATALOGUE. BEWARE OF INFRINGEMENTS!

Tire troubles?

You can't have any—with

You can't have punctures or blowouts with an airless tire—there's nothing to puncture or blowout. And you can have ease and comfort (Dayton Airless Tires are smoother riding than pneumatics).

And you can—and do—have complete freedom from the worry, delay, vexation and expense that go with punctures and blowouts.

You're not only getting rid of tire troubles if you are using Dayton Airless Tires, you're getting longer wear, and saving the expense of extra tires, tubes, etc. We guarantee Dayton Airless Tires for 5000 miles (3000 on a light car like the Ford).

They cost you more when you buy them, but they cost you far less as you use them. Buyers pay big dividends on tire repairs and accidents there's a definite sum of profit to be saved by using Dayton Airless Tires. Add up to show you how.

Which is Cheaper—EMCO Automobile OIL—Now, or a New Motor—Later?

WHILE the subject of lubrication may appear insignificant to the average motor car owner, yet in reality it is a subject of vital importance. Unless you *know* that the lubricant you are using is free from destructive ingredients, you'll discover it sooner or later at a great expense.

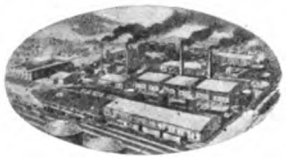
We make it possible for every car owner to avoid the element of uncertainty by this guarantee.

GUARANTEE

If Emco Oil does not prove satisfactory to YOU in absolutely every respect, we will refund your money in FULL—pay freight (both ways if oil is returned) and make no charge for oil used in trial.

Emco Automobile Oil is refined right where it is produced, in the very heart of the Pennsylvania Oil Field.

It contains absolutely no acids and no animal or vegetable matter to gum the cylinders. It is the purest of mineral oils, light bodied, of high fire test, pale in color and free from carbon. Thousands of pleased users are the best evidence of Emco superiority.



If your dealer cannot supply you, we will ship Emco direct to you in five or ten gallon cans, barrels or half barrels.

D&C LAKE LINES

Outwears 12 Ordinary Linings

That—after long use of various kinds—is the report of E. H Sheppard, Supt., Park Square Motor Mart Garage, Boston.

J-M Non-Burn is made of Asbestos Fibre, reinforced with brass wire. And Asbestos is a rock—fireproof, almost indestructible. Unlike organic brake linings, J-M Non-Burn doesn't char under frictional heat, and is impervious to oil, gasoline and water.

J-M Non-Burn Brake Lining

also has the highest friction-coefficient known to the engineering world. In emergencies it acts instantly, thus averting accident; while impartial tests show that most other linings will not bring car to a stop in less than 12 to 25 feet.

20 Miles to Gallon

Lawrence, Mass., July 18, 1912.
Gentlemen:—Enclosed find check for carburetor. I feel perfectly satisfied. It does 20 miles and over on a gallon. Can recommend it to anyone. G. A. Schmidt.

19 to Gallon on Cadillac

Planhard Co.—Edgewater, N. J., May 21, 1912.
I am very much pleased with my new Planhard Carburetor. I made a test of gasoline consumption from Edgewater to Hyde Park, N. Y., and return, and got a fraction over nineteen miles to the gallon. This is on my Cadillac.
John H. Hinners.

More Speed—Start Cold

Groton, Conn., Feb. 8, 1913.
Dear Sirs:—I put a Planhard on my single cylinder 6-8 h. p. Goshen engine. It gives 50 R. P. M. more than the ——— I took off. With the Planhard I can start cold or hot without priming, which few others can do.
Yours truly, E. A. Scriven.

3¾ More Miles

When Planhard Carburetors were put on the 6 cylinder, 4 cycle Frisbie motor of the fast boat Delphi II, she increased 230 R. P. M., and 3¾ more miles per hour.

Much More Power

Bath Marine Construction Co.—"The gasoline consumption at normal power was better than others and it would develop much more power when pushed." H. D. Bacon, President.
"Fifty miles without a miss."—Geo. E. Grosvenor, Crescent, Mich.
"To use the vernacular, 'some carburetor.' "—W. R. Fleming, 3311 Broadway, N. Y.

If you own a FORD!

Chicago, Ohio, July 1, 1912.
Gentlemen;—The Planhard Carburetor for my model S Ford Car is very satisfactory. I never bought anything for my car I paid so cheerfully for, as I have a smoother running engine with more power and get *more mileage per gallon* and my engine runs much cooler. H. W. Grandon.

Gallon Less Per Hour!

The "Black Eagle" Spark Plug

PATENTED

50 Cents Is Enough

The "Black Eagle" Spark Plug has made good because it was designed and manufactured with this result in view.

A person in close touch with the supply and manufacturing ends of the trade was a visitor at our factory recently, and was shown the details of construction, including the machinery, testing, and assembling of the "BLACK EAGLE" Spark Plug. What he said we believe will be of interest to you, as it indicates the effort on our part to supply a high grade plug at a reasonable price. We therefore quote below his impressions.

"I am simply amazed at the workmanship, material, and construction of the 'BLACK EAGLE' Spark Plug. When I saw this plug advertised at a price of 50c to the consumer, I naturally supposed it was a cheap, common, plug such as you occasionally find in jobbing houses on the bargain counter. I am convinced, after seeing these plugs tested, and examining minutely the machine parts which enter into their construction, that **no better porcelain spark plug is offered by any one, regardless of the price they ask.**"

We are not **influenced** by what our competitors **charge for spark plugs!** We have **ignored price precedent,** for the reason that a **high grade spark plug** can be manufactured and sold at **50c each, and that is enough.**

Sent prepaid on receipt of price. Made in all standard threads.

THE STANDARD CO. **Torrington, Conn., U. S. A.**

Don't Accept Anything Else

Insist on having the pioneer, the superior, guaranteed Blackledge Velvet Springs. There are imitations (always are, of every good thing), but don't accept any Shock Absorbing Spring unless you find the name "Velvet" on it. That name means everything to you in the matter of an easy riding motor car. Blackledge "Velvet" Springs are made in the best possible manner of the best possible materials, and are guaranteed to give genuine satisfaction.

"Just eat up rough going; take out the bumps"

Sixteen sensitive, durable coils support the car, and no matter whether it is a commercial truck, seven-passenger touring car or small runabout, they make riding over roughest cobblestones comfortable and pleasant. Save 35% tire wear, insure against breakage and save wear and tear on entire car. Anyone can attach them in 30 minutes.

BLACKLEDGE SHOCK ABSORBING VELVET SPRINGS

Elegant, Small, Strong, Durable

(We own the basic patent)

Desirable, Exclusive Sales Territory Open

LIVE REPRESENTATIVES WANTED

Our big advertising campaign is creating sales in every section of the country. There is a lot of desirable territory still open. Write us today and get in on the profits.

STUCK IN THE MUD

Now comes the season of mud and the desire to get out in the country and see how she pulls.

If she stalls in the mud—what then?

If you crank by hand you make a raft out of a convenient fence.

IF SHE HAS A SELF CRANKER, you simply sit in the seat and push a button.

The Electric Self Cranker and the

GLBA

STORAGE BATTERY

care nothing for mud

10 Books 800 Pages of Text 1500 Illustrations

Automobile Owners **Automobile Repairmen** **Students**
Automobile Drivers **Automobile Dealers** **Engineers**

Each book has been thoroughly revised and its contents have been brought right up to the minute. The subjects have been treated in a simple, non-technical manner, making the discussions as valuable to the novice as the engineer. Eighty per cent. of the automobile and technical schools in the United States and Canada use these works as text books, and more than 500,000 copies are sold annually. No similar expositions are to be compared with them—regardless of price. Every car owner and operator should have the full set.

Knowledge of your car means additional pleasure in its use and decreased cost in operation and maintenance. The practical instruction that you need is to be found in these books, and to acquire the same fund of information in any other manner would require years of constant study. You must understand your motor if you would adjust or repair it. The subject is fully treated in the Engine book. This applies as well to the Magneto, Carburetor, Battery, Lighting, Chassis and Tire books. When overhauling and rebuilding, read that discussion. The book on Motor Car Operation covers that subject with reference to all cars. No matter what the need, there is a book to meet it. No car or component is neglected, and all standard engines, magnetos, carburetors, batteries, lighting systems and vehicles are dealt with. The full set includes:

Engine	$ .35	Motor Car Tires	$ .25	Magneto	$ .35
Carburetor	.35	The Motor Car Chassis	.25	Motor Car Operation	.50
Lighting by Electricity	.50	Motorcycle Construction, Care and Repair	.35	Overhauling, Rebuilding and Repairing	.50
Battery	.35				

Full Set, 10 Books.....$3.75

CATARACT

TIRE-SERVICE

4000 MILE GUARANTEE

Mr. Motorist:—

Cataract Tires are the finest produced. Only the best of materials and workmanship enter into their construction. They cost more to produce per tire than any other tire made in America.

This season equip with Cataract Tires —They wear longer and give better service.

We guarantee them 4000 miles, but let us send you our book of testimonials. It will surprise you.

Mr. Dealer:—

A few territorial rights still open—get in touch with us by wire, phone or letter.

WHEN YOU TIRE OF OTHERS RE-TIRE WITH US

The Motor Truck

JULY ISSUE

Will be largely given over to a consideration of Department Store Delivery in several of the largest cities of the country where motor vehicles have been experimented but not generally used; where the conditions justify the greatest attention to haulage economy and receiving and shipping facilities, and where the methods the vogue have been continued practically without change for years, despite the evident and known expense.

These articles will illustrate the actual possibilities and will describe what has been done with motor and other forms of delivery, making comparison of existing installations and showing practical results from carefully developed systems.

The purpose is to demonstrate the use of motor vehicles experimentally by some concerns without change of horse facilities, and to show why satisfactory economy has not been realized from these trials.

The power wagon can be economically and satisfactorily used and the series of investigations for these articles will show what is needed in the conditions inquired into to bring the service efficiency to parity with that of concerns that have profited largely by motor haulage.

The MOTOR TRUCK will have all its customary features—Those that have made it the National Authority for Highway Transportation.

The number will reach all the large department stores of the United States and a majority of other stores having need of delivery service.

THE MOTOR TRUCK

Times Building, Pawtucket, R. I.

THE 8-DAY HIGH GRADE "CHELSEA" AUTO CLOCK

"SPECIAL"

"OFFSET"

"ROUND"

"LIMOUSINE"

Primarily intended for use inside the bodies of large enclosed cars, and for such use its case can be given a variety of fine finishes. It also makes an attractive clock for use on dashboards. Only made in 2¾-inch size.

The Justly CELEBRATED 8-Day, High-Grade "CHELSEA" AUTO CLOCK (*Trade-mark*)

NOW and for YEARS the RECOGNIZED STANDARD of EFFICIENCY

Clocks built with a view to stand the jars and jolts and rough riding of Automobiles. Reputation the highest. Used by parties demanding the BEST.

☞ **ALL SIZES STATED ARE THE APPROXIMATE DIAMETERS OF THE DIALS.**

All are 8-day High-Grade. All are in DUPLEX (patent applied for) polished cast brass cases, the most thoroughly waterproof case on the market. The "SPECIAL" clocks show dial on an angle; its inner cased clock, when removed from the outer (locked) case, is excellent for use on mantels, bureaus, etc., when touring; its outer case is screwed to dashboard by hidden screws. The "SPECIAL" clocks are in large demand from dealers for owners of finest cars.

The MOTOR CLOCK has the same clock movement which for years we have supplied for the hard use on Locomotives, Steam Fire Engines, etc.; its dial is of same appearance as the Auto Clock dial, but the Auto Clock movement has a somewhat finer train.

The 3½ MOTOR "OFFSET" is likely to prove a quick, ready seller. Very attractive.

Ask for our new Auto Clock Circular and Price List, illustrating and pricing the above and three new models, C, D and E.

PRICE LIST (Per Clock)

		"Round"	"Offset"	"Special"	"Limousine"
"CHELSEA"	2¾-in. Auto Clock.....	$26 00	$28.00	$36.00	$28.50
	3½-in. Auto Clock.....	28.00	30.00	45.00	Only made in
	3½-in. Motor Clock.....	24.00	26.00	41.00	2¾-inch size

If wanted fitted with outside (patent applied for) stem-winding and stem-setting device—the best of its kind—**Add $3.00 to above Price Lists.** (Such device we do not apply to the "Motor" Clocks or "Special" Auto Clocks.)

For Use on AUTOMOBILES and MOTOR BOATS

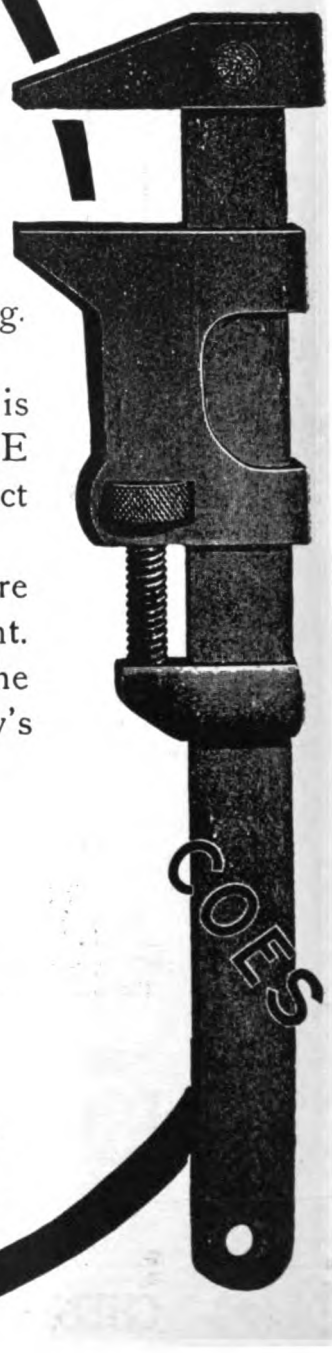
COES



THE
Wrench Supreme

Strength without bulk or clumsiness.
Ease of handling without slipping or bruising.
Perfect balance and right grip

Everything the motorist desires in a wrench is to be found in the "COES" AUTOMOBILE MODEL, and you will never know perfect wrench service until you pin your faith to it.

It stands to reason that the 5 per cent. more you pay for a "COES" wrench goes for 60 per cent. more quality and service—put this wrench in the tool kit and shop. You will get your money's worth.

When the Repair man performs the Autopsy

he finds, nine times out of ten, that ***poor lubrication*** has caused all the costly havoc. Then he asks the simple question,

"Why don't you use

TRADE MARK REGISTERED IN
NON-FLUID OIL ?"
UNITED STATES PATENT OFFICE

and he tells in his honest way what he, as a mechanic, knows about the depredations of cheap lubricants.

Why don't you use NON-FLUID OIL?

Get the genuine in orange colored cans.

THE SEVENTH ANNUAL

TOURING NUMBER

...OF...

THE AUTOMOBILE JOURNAL

A Practical Route and Guide Book That Has Permanent Value, Being Carried in the Car and Referred to Constantly Throughout the Entire Season.

SYNOPSIS OF CONTENTS

Tours 1 to 157—Including detailed routings, both going and returning, and embracing the entire country. Each itinerary is arranged to connect with all others, making it possible to start from any point and reach any other section in the United States or Canada.

Motoring Laws—Complete digest of the motoring laws of the various states, as well as similar information concerning Canada and Europe.

Preparing the Car—Detailed information relative to the preparation of the machine for long and short tours.

Care and Maintenance—Practical instructions as to the attention necessary with respect to Carburetion, Ignition, Tires and other components.

Foreign Touring—Equally complete data and routings for Great Britain and the Continent. Sailing dates and detailed instruction for taking the car abroad or securing one on the other side.

Camping Trips—Suggestions which should make a decided appeal to those who desire to utilize a number of shorter tours during their vacation outing.

Wearing Apparel—Authoritative data concerning the latest motoring garments for women, as well as the thoroughly practical outfit for men.

And many other special features in addition to the regular departments, containing all the latest news of motoring and motorists.

All Splendidly Illustrated with Special Cover Design and Printed as an Edition De Luxe.

ISSUE OF JULY 10, 1913

The increased demand for this standard compilation of touring information insures an even wider distribution than ever before. The manufacturer of cars, accessories and supplies, who desires that his publicity shall have permanent value in reaching the owner, will not neglect the opportunity for being represented in this number.

Weed Tire Chains enable you to safely make sharp turns and quick stops when a momentary loss of control means loss of life

The above picture illustrates one of the numerous situations in which you may be placed during bad road weather—when suddenly someone appears directly in your path and in a fraction of a second you must make a sharp turn and apply the brakes. It is then you require a firm unfailing grip on the road which can only be obtained by equipping all tires with

Weed Anti-Skid Chains

The Only Device that absolutely Prevents Skidding

No matter how expert and careful you are when driving on wet pavements and muddy roads, the *treacherous bare tires are a handicap that defeats your very best efforts to prevent a skid.*

The memory of one accident deters future enjoyment in the use of a car. Why run the risk of such accidents and why forfeit the pleasures of motoring forever after, when *safety can surely be yours by equipping all four tires with WEED CHAINS?*

WEED CHAINS cannot injure tires because "they creep." Easily put on in a jiffy without the use of a jack or other tools. Directions packed with every pair.

VOL. XXXV, No. 10 JUNE 25, 1913 Price, $1.00 the Year

NATIONAL GOOD ROADS SUPERVISION.

A Comparison of Construction and Maintenance Methods in America and Abroad—How the Various States Contribute to Secure Improved Highways.

ACCORDING to the United States Department of Agriculture, the average cost of hauling one ton of farm produce one mile in America is 23 cents, while similar service over European roads costs eight cents. It will not be denied that the difference in the original investment, labor and other commodities, enter into the computation, but these by no means account for the wide variation. These figures are a convincing argument of the economic value of good roads.

Street in Lauterbrunnen, Switzerland, Indicating the Character of Roads Built in That Country with Government Aid.

When organized motorists took up the work begun by the bicyclists, they were confronted by persistent opposition, and that public opinion has undergone a decided change is due in no small measure to the educational campaign which has been conducted by organizations formed for that purpose. Among these may be mentioned the American Highway Association, which was formed Nov. 22, 1910, "to harmonize and correlate all efforts for the improvement of public roads, to the end that adequate and efficient systems of road construction, administration and maintenance may be adopted in all the states."

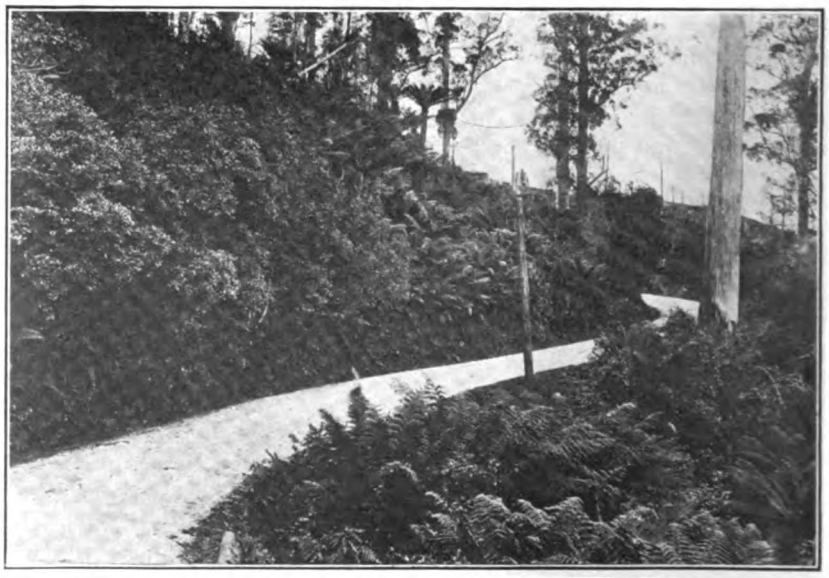
Elsewhere is presented a tabulation indicating in a measure the results accomplished along these lines. This has not been brought about solely by any one agency, but there can be little doubt that the activity of a national body of this

Digitized by Google

Brown's River Road from Hobart to Kingston, Tasmania, Built by Convict Labor Under Supervision of Imperial Government.

character has had much to do with the crystallization of public opinion and the direction of effort along the proper channels.

Practically all interests now agree that better ways are essential to the business success and economic welfare of the nation. The above wording of the object of the American Highway Association is particularly timely, since the campaign of education must hereafter be conducted along lines which shall develop the best methods. That the people are liberal in their response whenever called upon to exercise their suffrage with respect to good roads matters seem evident in most instances. The main question to be determined is the proper administration of the funds available for this purpose, that an efficient system of highway construction and maintenance shall result.



A comparison of the road mileage and the annual amounts expended by some of the leading European nations should prove of interest in this connection. It must be borne in mind that these countries are much older than America and that the percentage of improved roads in most instances is such that comparatively little new work is done each year, so that the cost figures given, which are approximate only, apply very largely to maintenance. The table appears in the next column.

The figures of the United States office of public roads show that America has 3,898,444 miles of public highways, less than five per cent. of which, 187,258.75, were entitled to the designation "improved" at the close of 1911. The tabulation herewith indicates that America is appropriating, in round numbers, $45,000,000 a year for construction and maintenance, although this amount should be augmented by the appropriations made by the counties and towns. It follows that the improved mileage must have been increased materially since 1911, but it is still far below the 70 per cent. in France, for example.

Aside from appropriating $500,000 in 1912 for federal aid in the construction of post roads in the several states, the United States government has as yet done very little toward the construction and maintenance of highways. A bill appropriating $25,000,000 for a similar purpose was introduced in Congress in January of this year. Otherwise, the national government has confined itself solely to the establishment of the

FOREIGN NATIONAL GOOD ROADS EXPENDITURES.

Country	Miles	Expense
France	520,088	$48,000,000
England and Wales	150,908	25,000,000
Prussia	95,076	35,000,000
Italy	92,199	6,500,000
Austria	74,265	3,000,000
Sweden	35,450	2,000,000
Spain	33,873	8,000,000
Hungary	31,800	1,500,000

Caretaker on the Road Between Paris and Versailles, France, Over Which It Is Estimated 10,000 Automobiles Pass Daily.

office of public roads, which acts largely in an advisory capacity. It may be added that the American Highway Association was very active in securing the $500,000 appropriation mentioned above.

In France the national government constructs and maintains the national roads, of which there are 23,754 miles, and aids by subsidies in caring for the vicinal roads, of which there are 331,908 miles, divided as follows: Roads of through travel, 107,065; roads of common interest, 47,263, and ordinary vicinal, 177,580. The first two traverse several communes or towns and the last are located within a single commune. The various departments construct and maintain the 9050 miles of departmental roads.

In England and Wales the highways are divided between main roads and roads other than main roads, of which the respective mileage is 27,286 and 123,082. The general government renders aid in construction and maintenance by the assignment of certain national revenues, by loans through the government road board, and by free grants from this board. The assistance is for new roads, or the road board itself may construct and maintain new public highways.

The German imperial government takes no part in the construction and maintenance of public highways, this being left to the several states. The empire has approximately 36,000 miles of state roads, of which Prussia has 20,489 miles, Bavaria 4200, Saxony 2267, Baden 1890, Wurtemburg 1710 and the other states the remainder. In addition there are a large number of county improved roads, of which Prussia has 74,587 miles.

Italy has 5159 miles of national roads, which are constructed and maintained by the national government. In addition there are 27,757 miles of provincial roads in charge of the provinces and 59,283 miles of communal ways. Austria has 10,008 miles of government roads in charge of the imperial government, which also has supervision over all the highways, there being 2288 miles of provincial, 39,212 district and 22,756 town roads. Sweden has 11,850 miles of main roads, connecting with other countries or connecting large cities and ports, for the construction of which the government pays two-thirds and the districts one-third, while on maintenance the government pays 15 per cent.

In Spain the state roads are constructed and

One of the Main Roads of England, in the Vicinity of Warwick, a Typical British Highway.

maintained by the general government through the department of public works, and it also aids by appropriations in the maintenance of provin-

Slag-Brick Road in the Vicinity of Hilversum, Holland.

cial roads. Hungary constructs and maintains its 5600 miles of national roads and contributes in some cases toward the support of the 17,400 miles of county roads. The provinces aid in the maintenance of the 8100 miles of district ways and 700 miles of parish roads.

While Russia has a large territory it has but 11,254 miles of post roads classed as public ways, of which 8326 miles are under the direct charge of the national government and 2928 are temporarily under the control of district councils with governmental supervision. Switzerland has 350 miles constructed and maintained by the cantons with federal aid, 862 built and maintained solely by the cantons and 6214 in charge of municipalities.

In addition to the countries already mentioned, Norway has 17,550 miles of roads, divided between 6570 miles of main and 10,980 miles of district ways. The national government contributes two-thirds to three-quarters of the construction of main roads, but the maintenance, with but few exceptions, is a local burden. The work is done under county engineers, nominated by county councils and appointed by the national government. Denmark has 4213 miles of main roads and 22,505 miles of local ways. The government does not grant money aid, but the work is under the supervision of a general superintendent of highways for the kingdom.

The reader is referred to the Good Roads Year Book of the American Highway Association for more detailed information concerning the road provisions of the various foreign nations. Accompanying illustrations indicate in a measure the character of highways built abroad. The Australian roads shown are constructed either by the imperial British government or the local colonial government, sometimes by contract and sometimes by convict labor.

In explanation of the tabulation concerning the expenditures by the various states in this country, it may be stated that the figures appearing in the first two columns were supplied by the United States office of public roads and may be regarded as thoroughly dependable in every way. The last column represents the result of correspondence with highway department officials in the several states. In some instances it has been impossible to secure an estimate of the funds available under this classification for the reason that the legislature was still in session and proposed appropriations had not been passed upon, or new state highway commissions had just been created and the officials were unable to make forecast. Where blanks occur it may be taken for granted that there is no provision for state highway funds.

So far as possible, an effort has been made to eliminate from the statement of funds available for 1913 any amount which might have been carried over from previous years, the object being to present the actual sums which have been expended on improved roads or which will be expended this year. The difficulty of reaching a determination of this character is better understood when the provisions of the various state laws are known. The following digest will aid in the proper study of the situation:

Alabama—Annual appropriation of $154,000 for state aid. Counties must raise a like sum. Convict labor may be employed.

Arizona—Law of 1912 provides for an annual tax to create a state road fund of $250,000. All roads and bridges

Section of the Road to Moltrasio, Past Lake Como, Italy.

constructed under this act shall be at the cost of the state. Local poll tax of $2. Convict labor may be employed if it does not interfere with free labor.

Arkansas—County road tax of three mills on the dol-

Digitized by Google

lar. Roads divided between first and second class. Former must be worked first and latter as county court shall direct. Convicts may be worked on public highways.

California—State is now expending proceeds of an $18,000,000 bond issue, of which $2,800,000 worth have been sold, for a state highway system. Special appropriations for maintenance of 11 existing state roads. Counties must pay annually a sum equal to four per cent. on the entire sum expended in the county, less such portion as the bonds matured shall bear to the total number sold and outstanding.

Colorado—State road fund apportioned by state highways commission, counties to raise a like sum. Local poll tax of $2. Convicts may be employed. Estimated total expenditure for the year on all roads, $2,000,000.

Connecticut—Balance of $3,000,000 bond issue available. Annual appropriation for care and maintenance. Proceeds from automobile law. Towns must raise from one-eighth to one-fourth of amount expended in state aid.

Delaware—State fund comprises proceeds of bond sales and special appropriation by legislature. Counties must raise a like sum to receive state aid.

Florida—All roads and highways under the supervision of county commissioners. Fund composed of county tax and proceeds from county automobile registration. Convicts may be employed.

Georgia—Provision for working convicts under contract system. County tax of 20 cents on $100.

Idaho—Legislature of 1913 created state highway commission and a state highway fund, comprising proceeds from automobile registration law and such bonds as shall be issued by the state. Now in process of organization.

Illinois—Proposition before legislature includes diverting income from the Illinois Central Railroad, inheritance tax and the automobile license law. These and special appropriations expected to yield at least $2,000,000.

Indiana—No state commission and no state funds. Counties may issue bonds not to exceed two per cent. of assessed valuation, and may levy tax not to exceed one cent on each $100. Convicts may be employed on public highways.

Iowa—Iowa State College of Agriculture and Mechanical Arts acts as state highway commission to devise plans and instruct county supervisors and others who make request. County fund for road work under county direction and township fund for grading and drainage. Both raised by taxation. Legislation pending seeking to establish state aid.

Kansas—Constitution provides that state "shall never be a party to carrying on works of internal improvement." Roads are classified as state, county, mail and township. First named are designated by the state and the second by the counties. Mail roads are those covered by rural free delivery routes. Road funds are raised by taxation. Surplus convicts may be employed.

Kentucky—Annual appropriation of $25,000 for state aid. Automobile license fees included in this fund. County and local road funds raised by taxation. Poll tax of $1.50. Convicts may be employed.

Louisiana—State highway engineer constructs and maintains improved roads and the state is reimbursed by the parish. Tax of one-fourth of a mill. Every male person between the ages of 18 and 50 shall work on roads not exceeding 12 days a year or pay $1 a day for such work required. Convicts may be employed.

Maine—New state highway law provides for state highway system and for state aid in certain instances. Bond issue of $2,000,000 available July 1. Annual appropriation of $250,000.

Maryland—Funds available for state highways comprise balance of $6,000,000 bond issue and $210,000, included in which is the net revenue from the automobile law.

Massachusetts—Available for state highway system by appropriation, $200,000, and from motor vehicle fees, $548,000. Special appropriations for specific roads total $500,000.

Michigan—Appropriation of $250,000 for state aid in 1913 made in 1912. Other appropriations pending. State "rewards" counties and townships at the rate of from $250 to $1000 a mile, according to the type of road built under state supervision. Convicts may be employed in the county in which they are confined.

Minnesota—State aid is granted for work done on roads designated by county commissioner. Funds available for 1913 as follows: State, $436,476.56; counties, $1,530,175; townships, $1,514,931.57.

Mississippi—No state funds. Convicts may be worked under state or county supervision. Every male person between the ages of 18 and 50 shall work 10 days in each year on public roads. Tax not to exceed one mill.

Missouri—General state road fund comprises estimated income of $100,000 from tax on brokerage business and $100,000 from automobile licenses. Additional income from excise tax in certain counties. Local funds by poll tax and levy of between 40 and 50 cents on $100.

Montana—New state highway commission in process of organization. State road fund includes five per cent. of money received from United States government from each forest reserve and the proceeds from the automobile registration law. Local funds by poll tax of $2 and levy of not less than one nor more than three mills on the dollar.

Nebraska—State road fund includes five per cent. of money received from United States government for each forest reserve and the proceeds from the automobile registration law. Inheritance tax goes to county fund. Local fund by taxation.

TABULATION SHOWING AMOUNT OF STATE MONEY APPROPRIATED OR EXPENDED FOR IMPROVED HIGHWAY CONSTRUCTION AND MAINTENANCE.

State.	Total Expenditures to Dec. 31, 1911.	Available in 1912.	Available in 1913.

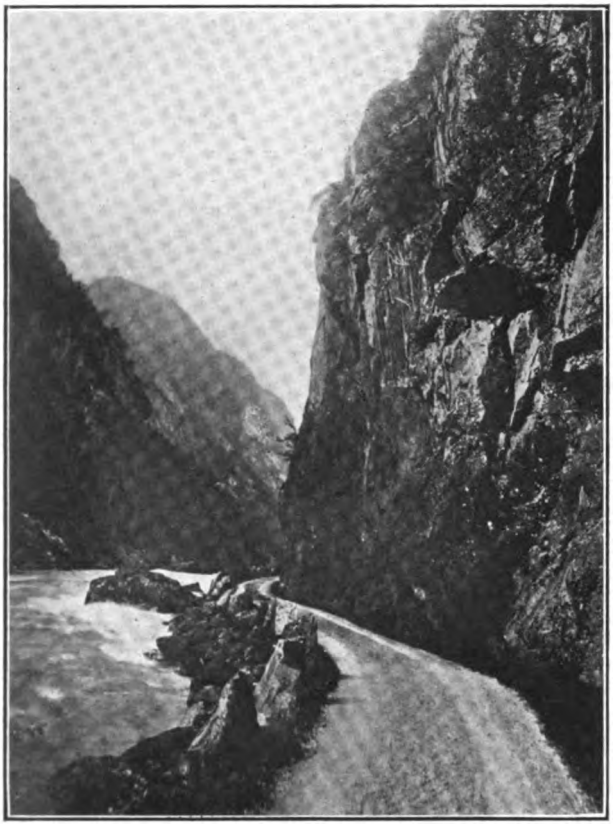
Digitized by Google

Nevada—Appropriation of $20,000 as general road fund. Voluntary work by convicts is permitted. County road funds by poll tax and levy not to exceed one-fourth of one per cent.



New Hampshire—Anticipated that annual appropriation for trunk lines will be $300,000 and $300,000 for state aid, the state, county and town each to pay one-third.

New Jersey—Annual appropriation of $400,000. County must pay 60 per cent. Also income from automobile law.

New Mexico—Estimated income includes $500,000 bond issue, $50,000 to $60,000 from taxation and $10,000 from automobile law.

New York—Income includes $50,000,000 bond issue, balance of $1,045,000 on old bond issue, appropriations and proceeds from automobile registrations, of which the sum of $10,000,000 is expected to be available during 1913.

North Carolina—State appropriates only $5000 for engineering assistance. Counties are permitted to issue bonds, and such bonds aggregating $1,000,000 have been

The Gorge on the Road to Odde, Norway.

voted. Some counties have proceeds from poll and dog taxes. Total amount available for county work this year is approximately $1,118,942.

North Dakota—New state highway commission in process of organization.

Ohio—Estimated income from appropriations and automobile law. Additional appropriation for repair work on roads damaged by recent floods. Counties are permitted to improve roads and assess benefits against abutting property owners.

Oklahoma—State fund includes revenue from automobile licenses only. Road improvement districts may be created by electors. Districts and towns may issue bonds.

Oregon—New state highway commission now being organized.

Pennsylvania—Legislation pending. Expected that old appropriation of $3,000,000 for trunk highways and $1,000,000 for state aid will be duplicated. Bill calling for $50,000,000 bond issue, if passed, must be ratified by the people. County fund by taxation.

Rhode Island—State fund comprises appropriations and receipts from automobile law. People voted two to one against proposition to issue $700,000 in bonds for state road work.

South Carolina—No state funds. Convicts sentenced to hard labor on public roads in county where convicted. County and local funds by taxation.

South Dakota—No state funds. Local funds by taxation.

Tennessee—Bill to create state highway commission pending.

Texas—No state funds. Convicts may be employed on county roads. All male persons between the ages of 21 and 45 are liable to work on the public roads not more than five days a year or to commute the same at the rate of $1 a day.

Utah—Annual appropriation and receipts from automobile law. Counties must duplicate from one-fourth to the entire amount apportioned by the state highway commission. County funds by poll tax of $2. Prisoners in jail and state prison may be employed.

Vermont—State fund composed of appropriations, maintenance fund and receipts from automobile law. Town funds by five per cent. tax.

Virginia—Annual appropriation, county to add equal amount. Counties have $300,000 in various bond issues, and road tax of 40 cents on each $100. Convicts may be employed.

Washington—Annual appropriations. Counties have bond issues of $3,300,000. Permanent highway fund raised by taxation of one mill, to be expended in counties where raised, 15 per cent. of cost to be assessed against abutting property owners. State convicts employed.

West Virginia—No state funds. County funds by taxation and road poll tax of $1.

Wisconsin—Amount available is about $2,500,000, of which the state, county and town each pay one-third. The initiative rests with the town.

Wyoming—Provision for use of convicts only. County funds by poll tax of $2.

It will be seen that the lack of uniformity is quite as marked in this respect as with the motoring laws, for instance. The American Highway Association has a substantial task before it, but when an examination is made of the new motoring laws passed during the present legislative season it will be found that the efforts of the American Automobile Association along this line have met with much better success than could have been hoped for a few years ago. This has been the result of a persistent educational campaign, and the American Highway Association is equally well equipped to further the interests of good roads legislation.

National—The Unconquered—The National Motor Vehicle Company, Indianapolis, Ind., is issuing a neat little booklet calling attention to the work performed by the National No. 8, winner in the 1912 500-mile race, as compared with that of the Peugeot, which took this year's event. The story is told by an eye witness of both contests and in such manner that the work of the two machines is compared at each critical point throughout. The conclusion presents the following interesting tabulation:

	Elapsed Time		Time for Period	
Miles	National	Peugeot	National	Peugeot
100	74:24	79:23	74:24	79:23
200	150:59	156:07	76:35	76:44
300	228:50	236:59	77:51	80:52
400	304:14	314:35	75:24	77:36
500	381:06	395:05	76:52	80:30

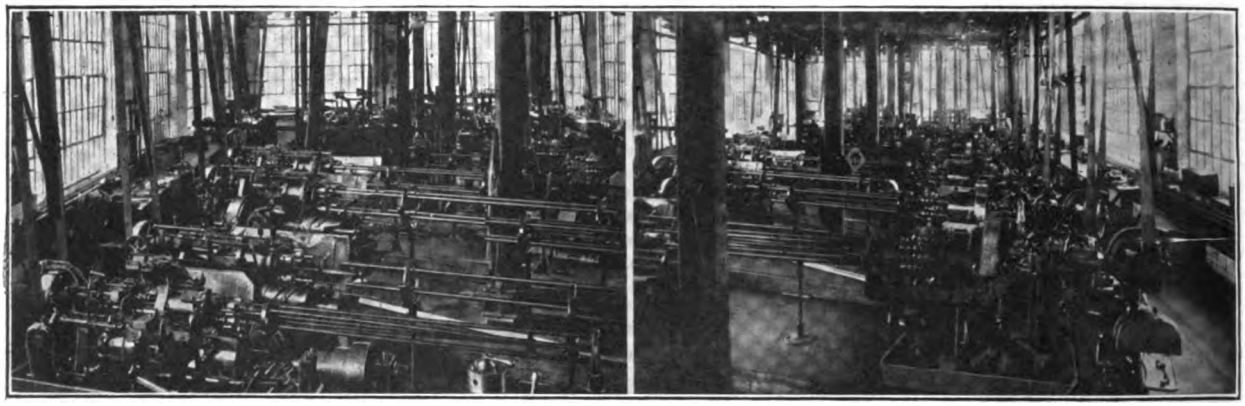
MANUFACTURING SPITFIRE SPARK PLUGS.

How an Output of Millions Annually, Embracing a Type for Each Motor, Is Handled at the Mount Vernon Factory of A. R. Mosler & Co.

(By C. P. Shattuck.)

THE high degree of efficiency obtained in the modern automobile is largely due to the refinement of details in which the ignition specialist has been an important factor. In the perfection of the magneto with its inexhaustible supply of current, it was generally supposed that maximum efficiency, insofar as ignition was concerned, had been attained. Until a few years ago it was considered sufficient if a spark plug ignited the charge and withstood the severe conditions of service to which it was subjected, such as extreme changes in temperatures, expansion and contraction, carbon, oil, etc., and the burning effect of magneto currents.



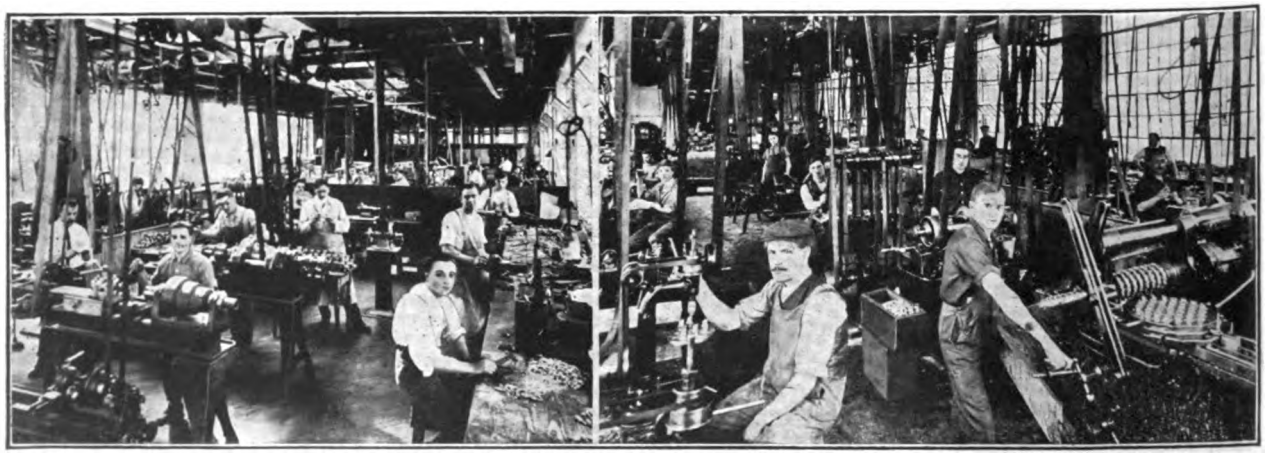
Factory of A. R. Mosler & Co., Mt. Vernon, N. Y., Maker of the Well Known Spitfire Spark Plugs.

Careful, scientific study and experimentation developed the fact that the construction and location of a plug in the cylinder are of vital importance; that the maximum motor efficiency is obtained only when the flame is spread instantly throughout the mixture, insuring complete combustion of the charge and eliminating waste of unexploded gas through the exhaust. Although it is a simple matter to design the length of the base so that the spark comes in direct contact with the fresh mixture, the construction and the material of the electrodes involves problems of manufacture in that the widening and shortening of the spark gap by expansion and contraction must be overcome. Other factors to be considered are: The elimination of carbon deposits, undue heat, the protection of the insulator, and the ability of the plug to provide an intense spark at low motor speeds. These problems have been solved by Arthur R. Mosler, the ignition specialist at the head of A. R. Mosler & Co., Mt. Vernon, N. Y., manufacturer of the well known Spitfire, Triumph, Mosler Junior, etc., spark plugs.

Mr. Mosler's rise to a prominent position in the automobile industry is remarkable. In 1900 he experienced, as did other makers of horizontal motors, plug troubles due to the lubricant fouling the gaps. To prevent the oil short circuiting the points he designed and patented the Spitfire closed end porcelain type with slots in the base to obtain a self-scavenging effect. The first 1000 were turned out in a lathe and fitted with imported porcelains. So successful were the plugs in overcoming ignition troubles and in economy of current, that they attracted attention from users of internal combustion motors, who were experiencing difficulty in obtaining efficient ignition. The demand soon exceeded the supply, leading Mr. Mosler to produce an additional 2000, which also found ready customers. Some

Digitized by Google

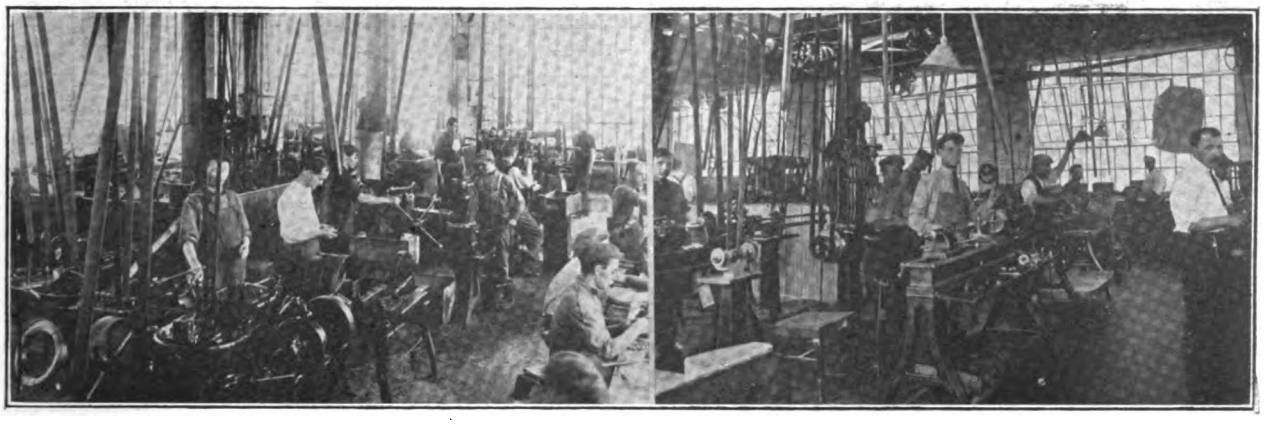
Illustrating the Batteries of Multiple-Spindle Automatic Screw Machines Which Produce the Blanks or Shells.



idea of the expansion of the business may be obtained by Mr. Mosler's statement that in 1904 he marketed 20,000 spark plugs, the following year 100,000 and in 1907 500,000. Today the output of the factory at Mt. Vernon, which was erected two years ago to meet the requirements of an increasing demand, runs into the millions annually.

Mr. Mosler attributes his success to the fact that for years he has made an exhaustive study of the requirements of the different motors manufactured and in the production of a spark plug especially suited to each distinct type. Not only are plugs made for pleasure and commercial cars, but for motorcycles and marine engines; in fact, for every type of explosive motor utilizing the jump spark system of ignition. For the past three years the engineers of the factory have compiled annually a booklet listing all makes of cars and motorcycles, showing the plug best adapted to each motor, and the books are distributed free to both the trade and owner.

The Mosler factory is designed and equipped to overcome the many problems of quality production. It exemplifies the value of scientific methods of manufacturing and it is a structure in which the efficiency of the manual worker is developed to a high degree, in that plenty of light and fresh air are provided in the rooms. The sanitary conditions are excellent. The building itself is of mill construction, slow burning, with sprinklers throughout. The entire ground floor is of cement concrete and is occupied by the special machinery employed for the manufacturing of the components of Spitfire spark plugs; by the buffing, polishing, nickel plating departments, and the store, stock and steel rooms.



In the second story are the offices and auxiliary store and assembly rooms. The last named are located directly under a large skylight, providing an abundance of light. The side walls are fitted with ample sized windows, as will be noted by an accompanying illustration. Power is supplied by two Nash gas engines and a White & Middleton, the latter being utilized for driving the lighting dynamo and an air compressor, compressed air being used extensively throughout the building.

As is evident the production of a large num-

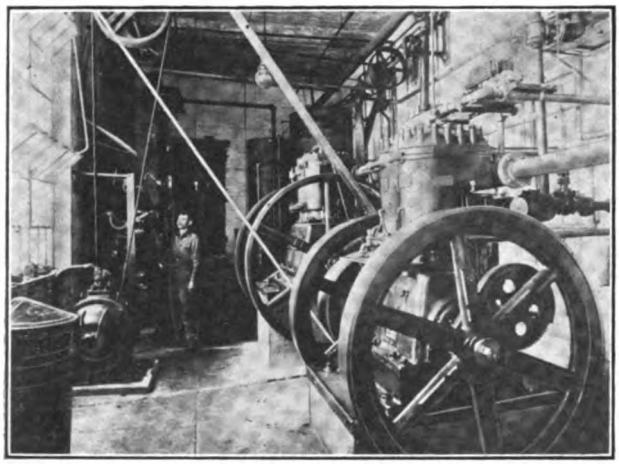
ber of different types of spark plugs involves a vast amount of detail, but the Mosler system of manufacture is so perfected that a defective part or faulty assembly can instantly be traced to the workman. It is practically impossible for either condition to be overlooked, as the inspectors are very thorough. The result makes for absolute satisfaction with the ultimate user, as the quality of material and workmanship are consistently maintained.



The process of manufacturing Spitfire spark plugs from the time the 12-foot lengths of steel are fed to the batteries of multiple-spindle automatic screw machines until the plugs are boxed ready for shipment, is an interesting one. Cold rolled steel is employed for making the bases or shells, it being purchased in enormous quantities, the dimensions varying in size from .875 to 1.125 inches, and either hexagonal or round stock is utilized, depending on the type of plug being manufactured.

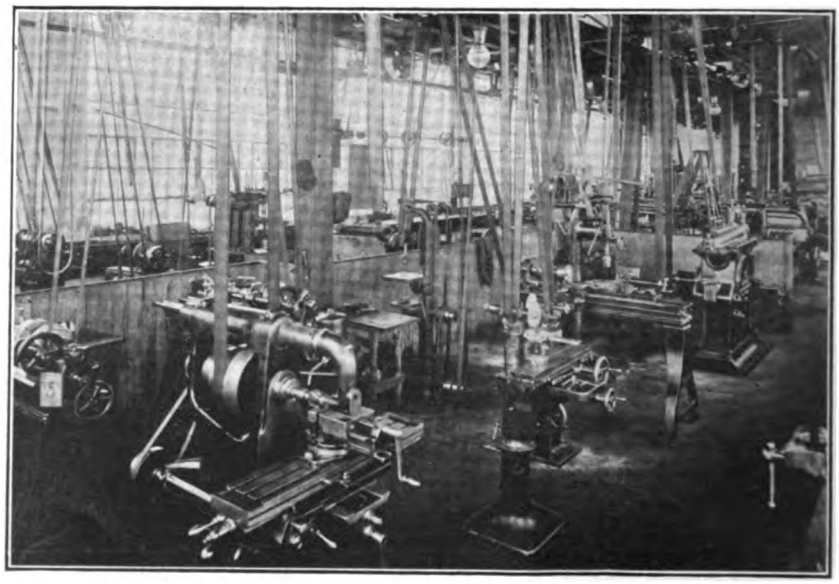
The Acme and Gridley multiple-spindle automatic screw machines are capable of performing eight operations at once, although but five are required to finish the blank for the Spitfire plug, the total including milling, turning, counterboring, drilling, reaming, threading, cutting off, etc. In principle the Acme comprises four work spindles, which are held in a cylinder and rotated by gears, the cylinder being indexed to bring these spindles in front of the side working and end working tools. It requires but one-quarter turn of the cylinder to complete one piece, this being accomplished in the same time as required to complete the longest cut, usually a drilling, forming or box tool turning operation. The 12-foot steel bars are placed in the spindle and the work of completing the blanks is performed automatically. The machines are adjustable to any size and shape of blank desired and turn them out at the rate of 100 an hour. The blanks and scrap fall into a pan from which the contents are removed and are placed in a separator. By the application of the principle of centrifugal force

Illustrating Sections of an Assembly Room, All of Which Have Plenty of Fresh Air and Light—Throughout the Factory the Sanitary Conditions Are Excellent.

Digitized by Google

Power Is Supplied by Gas Engines for Operating Machinery, Dynamo and Air Compressor.

all lubricant is removed from the metal, and the oil is filtered and used over again in the automatics.



From the separator the blanks go to a threading machine for cutting the threads on the base, after which they are carried to the slotting machine, which cuts two slots in the base of 16 blanks in one operation. Each machine has a capacity of 1000 plugs a day. Although a hex is provided on the blank it is cut to accurate and standard dimensions by the milling machines, which cut 37 in three operations. After being cleaned by compressed air the small hole in the end is bored and countersunk. Following this process the shells are subjected to a rigid inspection both before and after the removal of any burrs that may exist. In the machining and finishing extreme care is taken to remove any sharp points which would become incandescent in service.

Before being nickel plated each shell is highly polished, then cleaned in an electric bath, an invention perfected by Mr. Mosler. The shells are next assembled on special racks, two dozen to a rack, and placed in the plating bath with a capacity of 12 racks every 30 minutes. After plating, the shells are inspected, polished and again examined, before being sent to the assembly rooms.

The centre rod or electrode of the Spitfire closed end type is constructed in a machine into which is led a roll of nickel steel wire. The machine straightens the metal, threads, points and cuts it off into the required lengths. The small hexagon brass nut which determines the position of the point with reference to the aperture in the base, or in other words, the gap, is located accurately by a machine after the nut has been started by hand.

With the Spitfire plug an asbestos cord is utilized as a gasket, being placed on the centre rod before insertion in the porcelain. This is performed by a machine which incures the correct adjustment and gas tight construction. Asbestos is also employed on the centre core, it being wound by hand, and formed and suitably compressed by a machine. The knurled nut, securing the centre rod, is adjusted by hand.

The threaded bushing or cap retaining the porcelain in the shell is fitted by a special machine having a form of friction clutch which interrupts the power when the desired pressure has been attained, the complete operation requiring but a few seconds. The asbestos copper gasket utilized on certain types, which insures a gas tight fitting of the plug in the cylinder, is spun and polished in one operation by another special machine. The plug then passes to a workman, who by one or two deft movements with a tool, accurately sets the gap. Each completed plug is tested by an induction coil, subjected to a final inspection, then tested for gas tight construction. The last named operation is performed in a special machine supplied with compressed air at a pressure exceeding by several pounds that to which the plug would be subjected in service. As

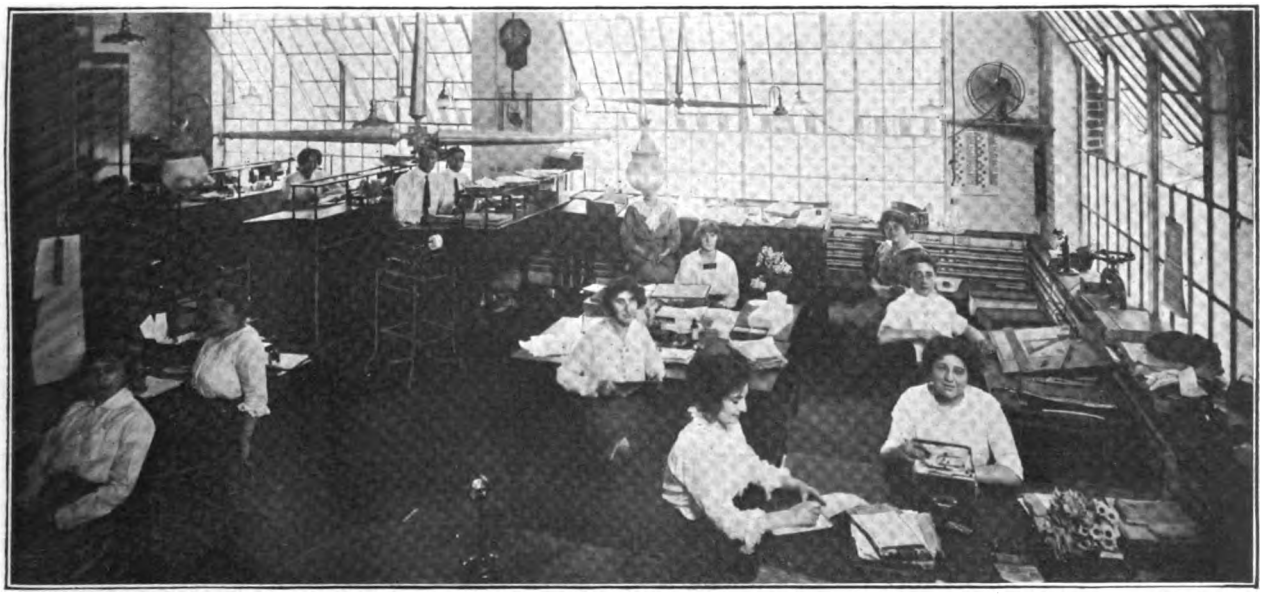
Showing a Section of the Tool Room and the Machines U tilized.

Digitized by Google

the plug is immersed in water any leak in the assembly is detected instantly by the bubbles given off.

The above process of manufacture deals with the standard nickel wire electrode Spitfire spark plug, which is but one of many produced. Although the dimensions of the centre rod point are such that it will withstand the burning effect of magneto currents, the platinum iridium pointed plugs are best adapted for both battery and magneto. The centre rod is bored in a high speed drill and the liberal section of platinum inserted and secured by a press machine. The platinum, which is worth about $50 an ounce, is cut into the required lengths by a special cutting machine.

In addition to the closed end types an open end cone end is constructed in several designs and with one or two points. The centre electrodes of the conical type are cemented by a special process and the brass retaining caps are fitted by a machine especially designed for the work. The process of fitting the wire electrode in the base of the shell is similar to that employed with the platinum iridium plugs.



The porcelains utilized are imported and each member is given a severe test to prevent faulty insulation. Each porcelain is also carefully examined and must conform to the standard set by Mr. Mosler. This assures rapid assembly of the parts and a perfect finished product. As several patents have been granted to Mr. Mosler, the dates are stamped on the hex of each shell. This operation is performed by a special machine, taking place before the blanks are sent to the polishing room. After passing the final examination

Arthur R. Mosler, Head of A. R. Mosler & Co., Inventor of the Spitfire Spark Plug.

the plugs are boxed and packed in cartons, the work being performed by girls. Those shipped to the car manufacturers are placed in nests in boxes of 100, and these packed in cases.

A section of the lower floor is set apart for the making of motorcycle plugs which embrace both mica and porcelain types, also combined mica and porcelain, and many of these are produced for motorcycle manufacturers. The mica plug is constructed of the best selected India mica, wound both ways, and is thus considered to be impervious to the action of oil or heat.

The Main Office of the Mosler Factory—Note the Large Windows Providing Good Light and Ventilation.

Digitized by Google

As previously stated a number of different types of plugs are produced, including in addition to the Spitfire, the Mosler Vesuvius, Triumph and Mosler Junior, etc. Each type is constructed in varying lengths of bases to so project the spark into the combustion chamber that maximum motor efficiency will be obtained by reason of instantaneous ignition of the charge. The thickness of the cylinder walls, type of valve cap, etc., important factors in spark plug construction, are also taken into consideration as the requirements of different motors vary. All types are based on long study and careful experimentation of the cylinders for which they are designed.

The Mosler spark plug has been adopted by a large number of leading car manufacturers after severe break down tests. Until recently the factory was operated night and day to fulfill 1913 contracts. Although produced in enormous quantities, quality is never sacrificed.

Guests of H. S. Firestone at Recent Firestone Foremen's Homestead Dinner.

Arrangements for a fall automobile show under canvas are being made by the Cleveland Automobile Show Company, in conjunction with the Forest City Fair & Livestock Company. The Cleveland Automobile Club has promised its support to the project, which will be a novel one for the Ohio city. Two of the biggest circus tents in the country will be obtained and they will afford 100,000 square feet of display space.

Quentin D. Curley of Dallas, Tex., county judge, has only the stub of one arm, but he manages to drive an automobile all about the city by a specially contrived arrangement. It consists of a small steel hoop, leather lined, into which he thrusts the stump of his arm. This hoop is attached to the steering wheel. The throttle and spark levers have been removed to the footboard, where is also the push button for the electric horn. The judge has a special strap arrangement passing over his shoulder, by which he cranks the engine.

FIRESTONE HOMESTEAD DINNER.

District Attorney Whitman of New York Was the Guest of Honor.

Saturday, June 14, Akron and Columbiana, O., and all the towns and cities in between, were the scenes of one of the most "exclusive affairs" of the season in automobile circles. It was the occasion of the Firestone Foremen's Homestead dinner, tendered by H. S. Firestone, president of the Firestone Tire & Rubber Company, Akron, O., to the foremen of the company at the old Firestone family homestead in Columbiana. The party made the trip by automobile, 30 cars being needed to take the 145 guests.

The guest of honor was Charles S. Whitman, district attorney of New York City and candidate for mayor. Mr. Whitman is a boyhood friend of Mr. Firestone, so the affair was a pleasant reunion in every particular. The route to the old homestead was selected for its scenic values, and Ohio has never before displayed 70 miles of its spring beauties to better advantage.

The Studebaker Corporation, Detroit, maker of Studebaker cars, has issued a new catalogue showing its complete line in a well chosen assembly of paper, type and color work. Dignity is the keynote of the book, the plan followed being that of giving a general description of each car on one page and facing it with a page plate illustrating several views of the machine. Detailed specifications are condensed in a table in the back pages of the catalogue.

There are 16,000 workmen in the Ford plant and it is pay day five days in each week there. Even then it takes considerable hustle to pay each man once every two weeks.

THE AUTOMOBILE IN THE FARMER'S LIFE.

UNTIL comparatively recently the automobile, although conceded an exceedingly practical institution, was regarded generally in the nature of a luxury. It is hardly more than a year ago that certain financiers were deploring the lack of business judgment manifested by the American people in purchasing motor cars rather than stocks and bonds.

The so-called back to the farm movement has been encouraged in no small measure by the possibilities of modern transportation facilities. Undoubtedly, this may be applied to the city man who has acquired what might be termed a country residence, still depending upon his business in the city for his income, but it also has a deeper significance in the economic history of the country. Farming is now recognized as a business, which requires the same detailed application of well defined business principles as that of manufacturing, merchandising or any interest which occupies the attention of those who seek their advancement in municipalities.

The Lambert Automobile Finds a Place Beside the Oxen and Horses on J. S. Charles' Farm in Bliss, N. Y.

While the boys and girls were drifting from the farm to the city, the list of abandoned farms grew larger each year. It is only necessary to examine the statistics respecting the New England states during the past few years to discover that the abandoned farms are now being taken up rapidly. Scientific methods of farming, as taught in the agricultural colleges, have had their full share in this rehabilitation, but the automobile has been an important factor. Boys and girls are no longer drifting to the city, because the city offers little that cannot be enjoyed by those who can make the short run in a motor car and because the country life of today presents advantages that appeal alike to the country and the city youth.

And if this applies to the boys and girls, it certainly affects the daily life of the farmer's wife. The possession of an automobile may not make it any the less difficult to secure and retain desirable help in the kitchen, but when the girls of the family are satisfied with the situation presented the problem no longer assumes its former proportions. Time is found to enjoy the car both in the afternoon and evening, and again on Sunday. If it is possible to reside in the country and possess a machine at less expense than to have the home in the city without it, this surely is true of the farmer who already has his country residence and derives his income from his land.

Much of the drudgery of farm life was occasioned by the dull monotony of the daily task, without sufficient relief in the form of social activity. The young folks hesitated to ask father for the use of the horse that had been at work all day that they might enjoy the evening with relatives or friends living at some little distance. The automobile never tires, is instantly available at all times and will take the whole family, including father and mother.

J. S. Charles of Bliss, N. Y., is a progressive farmer, who apparently still finds use for a yoke of oxen as well as a pair of horses in his farm work. But he owns a Lambert automobile, and his wife has learned to operate it. Not only is Mrs. Charles enabled to visit her relatives and friends, but often when her husband is busily engaged with the oxen and horses both find it to advantage in a business way for her to run errands in the car. The telephone is a big factor in modern farming, but the automobile supplements the telephone and completes the transaction.

This is only one instance of many that might be cited, but it serves to illustrate the manner in which a car may be made to fit into the business as well as the social life on the farm. Carrying this a step farther, C. C. Burgess of Greenville, S. C., owns a Reo which he purchased in 1910. He reports that he has driven the car about 7000

Digitized by Google

How L. W. Wible of Kendallville, Ind., Makes His Pleasure Car Aid in Making the Farm Pay.

miles a year, carrying an average of 800 pounds of milk each trip. The machine takes the place of three horses, doing the work in half the time and at half the cost. And yet, when the day's work is finished the machine is readily convertible into a two-seated vehicle in which the members of the family may enjoy life to its fullest extent without a suggestion of its being tired.

Charles Piper of Farragut, Ia., finds his Reo invaluable in the management of his large estate. Mr. Piper is a German by birth, but has been exceedingly successful in acquiring property in the land of his adoption. His estate really embraces a number of farms, all of which are operated along strictly modern lines. Mr. Piper personally superintends all of the work, making the rounds in his machine. Hundreds of similar installations are to be found throughout the entire country, from Maine to California, and in each instance the automobile has been a decided agency for efficiency, economy, comfort and progress.

It is needless to say that the use of a car as a rapid means of reaching the different points on the farm or for carrying produce to market does not in any manner interfere with its service as a social factor. Jacob Klassen of Goessel, Kan., purchased his machine that his wife and children might have full opportunity to secure the most out of life. Perhaps he had in mind those numerous Oldsmobiles of the 1902 model which have been for years engaged in sawing wood, churning butter and threshing grain, when he connected a jackshaft to the motor on his Reo and utilized the power for blowing hay into the barn loft. His seven-year-old son thus accomplished the work of a full grown man. There can be little doubt as to the resultant economy, and the car was still available for Mrs. Klassen's needs as soon as the job was finished.

Jacob Klassen, Goessel, Kan., Simplifies the Work of Storing Hay by Utilizing the Automobile's Motor.

L. W. Wible of Kendallville, Ind., uses his Lambert for plowing, but he has another of more modern design which he utilizes solely for pleasure purposes. He purchased this first machine for the social betterment of his family, but he found so many uses for it in his business, and that the economy effected was so marked,

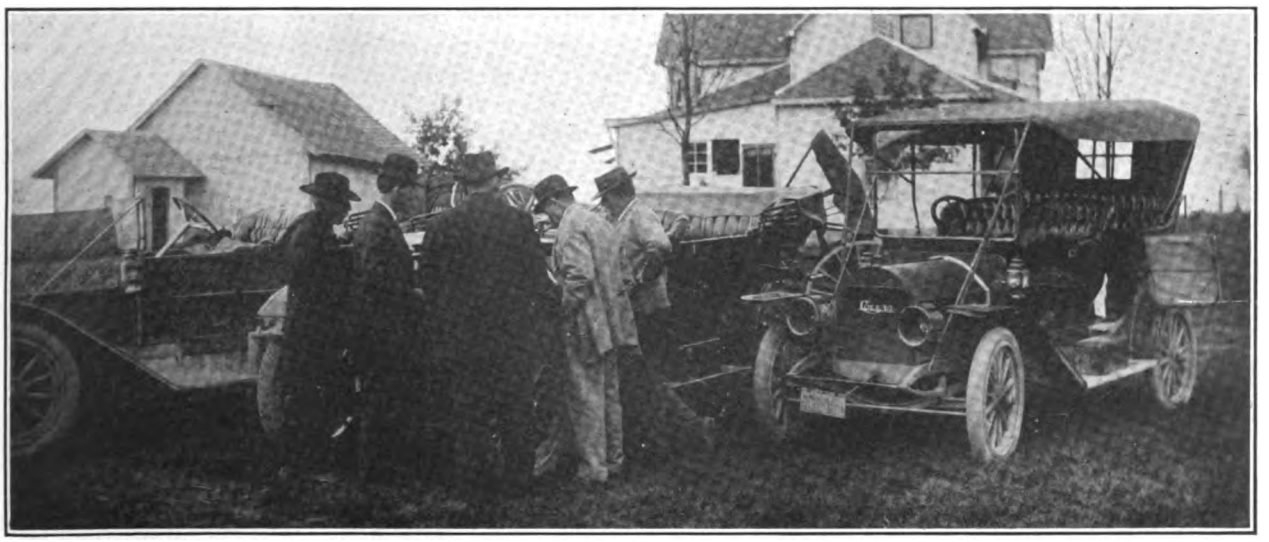
C. C. Burgess, Greenville, S. C., Uses His Reo as a Milk Wagon, Converting It for Pleasure Drives on Sunday.

he felt he could afford the second as well. Mr. Wible is a large onion grower, and not only is the older Lambert employed in preparing the soil and cultivating and harvesting the crop, but the rear has been reconstructed so as to take a large box in which the onions are carted to market.

Louis M. Megee is another Hoosier farmer who has found that the automobile is a paying proposition. He has the agency for Cole cars and has been successful in interesting nearly all of his neighbors. Recently he enlarged his operations to cover the entire county. All of which serves to indicate that the farmers of Indiana are not slow to appreciate the advantages offered by the modern transport.

When it comes to the matter of conservatism, the American farmer has the reputation of not spending his money foolishly. What is true in Indiana is equally true in all other sections of the country. The results are a saving in time, labor and money for the farmer himself, and

Digitized by Google



Charles Piper of Farragut, Ia., Finds His Car Invaluable in Superintending the Work on His Large Acreage.

pleasure, comfort and satisfaction for his family.

But that is not all. The influence of the automobile in farm life does not end with its benefit to the farmer. When organized motorists began their agitation for good roads, they met with decided opposition from this source. Today good roads have no more energetic advocate than the farmer motorist. And while the original agitators may have had a somewhat selfish motive, the latest recruit argues for better highways on the basis of their economic value.

The pleasure car has done much to change the viewpoint, as well as the social and financial condition, of the farmer. On the large tracts in the Middle and Far West, and in Canada, agricultural tractors have been doing the heavy farm work for some years. The farmer of the future also will find a place in his scientific management for the motor truck, so that in the last analysis the entire public will benefit in the increased efficiency and productiveness of the individual investment.

According to an announcement made by the Abbott Motor Company, Detroit, maker of Abbott-Detroit cars, a complete reorganization of the company has just been effected, a new financial plan has been worked out, and the conduct of the concern's affairs has been vested in a board of directors and general manager who have had wide and successful experience in the automobile field and other high grade merchandizing. The new officials are: President and general manager, A. E. Schafer; first vice president and treasurer, A. H. Zimmerman; secretary, Wade Millis; directors, the officers and H. W. Lewis, H. J. Mallery, G. H. Rogers and H. M. Preston. Work on the 1914 models is progressing rapidly.

Louis M. Megee, Agent for the Cole Line, Has Little Trouble in Interesting His Neighbor Agriculturists.

GENERAL NEWS OF THE INDUSTRY.

Barkman Leaves Maxwell Company to Return to the Pacific Coast with Hupmobile Interests—Boston's Pioneer Dealer Leaves to Engage in Railroad Business.

IN ANNOUNCING his resignation as assistant commercial manager of the Maxwell Motor Company, Detroit, A. B. Barkman, who has been closely identified with the Maxwell interests since 1906, has occasioned much surprise. Mr. Barkman becomes western sales manager for the Hupp Motor Car Company, Detroit, maker of the Hupmobile, and will make San Francisco, Cal., his headquarters. In returning to that city he again enters the territory of his adoption, as he became western sales manager of the United States Motor Company in 1911 and spent two years on the Pacific Coast, during which time he became very enthusiastic concerning the country.

A. B. Barkman, Western Sales Manager, Hupp Motor Car Company.

During 27 years of business life Mr. Barkman has made in reality but three changes. He started in the bicycle business and naturally gravitated into the motor car industry in its early days. It was in 1886 that he became sales manager of the bicycle department of A. G. Spaulding & Bros., at the factory Chicopee, Mass. In 1898, when the American Bicycle Company was formed, he became sales manager of the Spaulding division of that concern, remaining until late in 1899.

Early in 1900 he saw the possibilities of the motor car business and became treasurer and general manager of the Bridgeport Motor Company, which he formed at Bridgeport, Conn. In 1906 he gave up this business to become sales manager of the Maxwell-Briscoe Motor Company at Tarrytown, N. Y. After five years at Tarrytown, Mr. Barkman became western sales manager for the United States Motor Company, which controlled the Maxwell-Briscoe company, and when that concern was merged with the Flanders interests into the Maxwell Motor Company he was called East to become assistant commercial manager.

UNDERHILL IN CALIFORNIA.

Boston's Pioneer Dealer Handled Knox Cars for Over 12 Years.

When it was announced that the Knox Automobile Company, Springfield, Mass., had established a factory branch in Boston, it was but natural that the automobile industry should be more than usually interested in the reason for the move, inasmuch as A. P. Underhill of the Underhill Company has been handling the Knox agency in that city since 1900. In this respect Mr. Underhill holds a unique record in the industry. Besides being practically the rst automobile dealer in Boston, and therefore in America, he has the distinction of representing one line of cars continuously from the beginning.

A. P. Underhill became interested in automobiles about the time that Kenneth Skinner imported his first De Dion tricycle, and it was shortly thereafter that he began business as a dealer in the old Automobile Headquarters on Stanhope street. It was at this establishment that Harry Fosdick and some others assisted him in interesting the people of Boston in the new method of transportation. Mr. Underhill was the first agent the Knox Automobile Company had, and perhaps it is not too much to say that it was largely through his efforts that the Knox concern was enabled to get its first machines upon the market.

Some time later the Underhill Company was organized and located at 222 Columbus avenue, where Frank B. Crockett, the manager of the new Knox Boston branch, became identified with the institution. Two years ago, the present quarters at 885 Boylston street were acquired. and this is the establishment which has been taken over by the new branch.

Mr. Underhill took a short vacation from the automobile business in 1910, going to Lake Tahoe, Cal., where he became intimately associated with the project of which he is now to be the business head. The property not only includes a

Digitized by Google

large hotel at the lake, but a steam railroad line leading thereto and a steamboat transportation company on the lake itself.

Mr. Crockett, who becomes manager of the Knox Automobile Company, Boston branch, also has had long experience in the industry. He formerly was associated with the sale of the Crest cars. and became connected with the Underhill Company in 1905. Two years ago he left that concern to go with the Boston branch of the Locomobile Company of America, which position he left to assume his new duties.

REO COMPANY'S DIVIDENDS.

Directors Place Stock on 10 Per Cent. Basis with Quarterly Payments.

At a recent meeting of the board of directors of the Reo Motor Car Company, Lansing, Mich., maker of Reo cars, it was unanimously voted to place the stock of the company on a 10 per cent. annual dividend basis, payable quarterly.

The dates upon which the quarterly dividends will be payable were fixed as the first of July, October. January and April, to stockholders of record at the close of business on the 20th of the month preceding the above mentioned dates. All additional dividends earned and paid by the company will be treated as extra dividends. The Reo concern is capitalized at $2,000,000 and has a surplus amounting to about the same figure.

RESIGNS FROM FIAT CONCERN.

Willard Disposes of His Holdings and Future Plans Are Awaited with Interest.

Richard D. Willard, secretary of the Fiat Motor Sales Company, and manager of the New York City branch of that company, has resigned, having disposed of all his interests in the concern. Mr. Willard has not yet announced his new connection and it is expected he will take a brief vacation trip before taking up with any of the several offers that have been made to him.

He has been connected with the automobile business for 12 years, starting in 1901 with the Autocar Company at Ardmore, Penn., and remaining there three years. With C. A. Duerr he introduced the Ford car to New York in 1904. He passed a year with the Richard-Brasier agency and then went with the Harrolds Motor Car Company, agent for the Pierce-Arrow cars. After remaining there three years he was associated for a time with Harry S. Houpt in handling the Thomas, Houpt-Rockwell and Herreshoff lines. Since 1910 he has been with the Fiat company.

ELECTED TO DIRECTORATE.

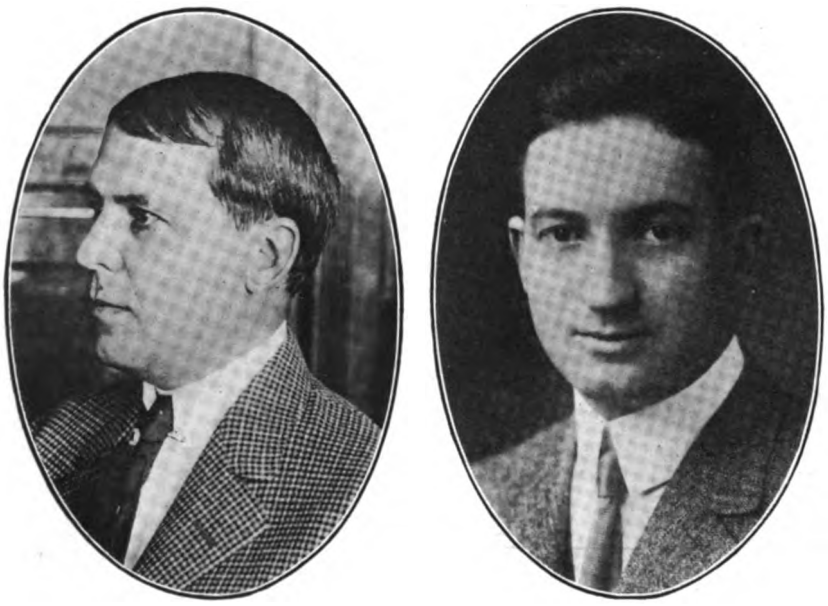
Sales Manager of Lenox Motor Car Company Wins Deserved Promotion.

At the semi-annual meeting of the board of directors of the Lenox Motor Car Company, Boston and Hyde Park, Mass., William Blanchard of Boston, sales manager of the company during the past three years, was elected a member of the board. This move was made necessary through the resignation of one of the members and was a fitting tribute to the value of Mr. Blanchard's services to the company.

William Blanchard, Director, Lenox Motor Car Company.

Mr. Blanchard has been connected with the industry for the past six years. He gained his first knowledge of motor cars with the Easton Machine Company, South Easton, Mass., maker of the Morse line, where he worked in every department, serving his full time at the bench and in the shop. It was while acting as salesman for Morse cars that the Lenox company induced him to undertake the exploitation of its line. His first connection with this company was in 1911 and early in 1912 he was promoted to become sales manager, in which position he has contributed much to the success of the Lenox company.

INTRODUCING REPUBLIC WAGON.



Alma Motor Truck Company Organized to Produce and Market New Vehicle.

The Alma Motor Truck Company has been formed to take over the motor truck manufacturing business of the Alma Manufacturing Com-

Digitized by Google

pany, Alma, Mich., and W. M. Hogle has been appointed sales manager with a general sales office at Detroit. Mr. Hogle entered the automobile business with the Olds Motor Works, Detroit, 11 years ago, and later joined the Pope-Toledo Company. He was with the Sheldon Axle Company for three years and for two years was connected with the Alden Sampson Motor Truck Company at Detroit.

F. W. Ruggles, factory manager and superintendent of the company, with Mr. Hogle, brought out the design for the new truck, which will be known as the Republic. Mr. Ruggles was for seven years with the Knox Automobile Company, Springfield, Mass., maker of Knox trucks, and has been with the Alma concern for the past four years. The new Republic truck will be manufactured in one model only, rated at 1500 pounds, with either stake or express body. It is composed of standard parts throughout, with Continental motor, rated at 28 horsepower and regulated by a governor which takes the speed entirely out of the hands of the driver.

Harry S. Houpt, President, and L. A. Van Patten, Vice President, H. S. Houpt Company.

Immediate arrangements will be made to market the Republic wagon from the Detroit offices throughout the entire United States, contracts already having been entered into for much territory. The Star-Tribune Motor Sales Company, Detroit, of which J. E. Hannon and George C. Hupp are at the head, will handle the truck in the State of Michigan and will open service stations in the large centres, the first outside of Detroit being at Grand Rapids.

REVIVES OLD TIMES.

Organization of H. S. Houpt Company Recalls Concern of Similar Name.

Those familiar with the history of automobile selling organizations of the earlier days of the industry recognize in the recent formation of the H. S. Houpt Company of New York City a return to old times. Incidentally, it may be remarked that the Harry S. Houpt Company, which was the name selected by Harry S. Houpt in his former venture, was a decidedly important factor in the sales end of the business, not only in New York, but in Philadelphia and Newark, where branches were maintained.

Mr. Houpt was president of the old organization and holds the same position with the new. The concern was established for the purpose of handling Thomas cars and speedily built up a large trade. The New York garage had capacity for 150 machines, which was considered of substantial size in those days. Besides, there was one of the best equipped repair shops to be found anywhere. Mr. Houpt was prominent in race, contest and tour work, when not actually engaged in selling cars.

Until recently Mr. Houpt was sales manager for the American Locomotive Company, but before that connection he was engaged in the manufacturing end for a time. His varied experience made him an exceedingly valuable man for the Alco interests, and when it was announced that he had resigned to accept the vice presidency of an elevator concern in New York City it was with some little regret that the automobile industry felt it was losing him. It appears, however, that the sale of motor cars proved to have such an irresistable attraction for him that he was unable to give it up for long.

Associated with Mr. Houpt in the new company, which has taken over the Lozier agency, heretofore conducted by the Lozier Motor Company as a factory branch, is L. A. Van Patten, who becomes vice president of the Houpt company. Mr. Van Patten formerly was advertising manager for the American Locomotive Company and as such was in close touch with Mr. Houpt and his methods.

MACK INTERESTS COMBINE.

Lansden, Webb and Maccarr Companies Merge with Factory at Allentown, Penn.

As predicted some time ago, The Lansden Company, Newark, N. J., the Webb and Maccarr companies of Allentown, Penn., have been consolidated and the Lansden factory will be moved to Allentown. The control of the Webb company was acquired by John M. Mack, founder of the Mack Bros. Motor Car Company, at Allentown. When the latter company was merged with the Saurer and Hewitt companies as the International Motor Company, Mr. Mack was prominent in the affairs of that organization. He retired last year and purchased control of the Webb Motor Fire Apparatus Company of St. Louis, Mo., moving it to Allentown and changing its name to the Webb Company.

The Maccarr Company was organized by Mr. Mack late in the autumn to build delivery wagons of 1500 to 2000 pounds. He also acquired a large interest in the Lansden Company and a short time ago W. L. Case, who had been general manager of the concern for more than a year, retired. It was at that time predicted that a merger of the Mack interests was contemplated. The Lansden Company manufactures electric trucks and wagons from 1000 pounds to five tons capacities, and the Webb company produces fire apparatus of every type, with both gasoline and electric equipment, having obtained the rights to the Couple-Gear wheels.

BUYS WHOLE VILLAGE.

Williamsville, Conn., Becomes Property of Goodyear Tire & Rubber Company.

The Goodyear Tire & Rubber Company, Akron, O., maker of Goodyear tires, has announced, through C. W. Seiberling, vice president of the company, the purchase of a large tract of land, known as Williamsville, in the town of Killingly, Conn. On the property is a large cotton mill, four stories high, where will be made a large part of the tire fabrics, hose and belting ducks so extensively used by the company. There also are sufficient houses to care for 350 employees, a church, schoolhouse, a farm to be operated by the company for the benefit of the employees, a store, large boarding house and an assembly hall, together with Lake Alexandria, the local water supply, and the Williamsville Water Company.

The factory will be equipped with the most modern machinery and will be run steadily at a uniform output on fabric for the exclusive use of the Goodyear Tire & Rubber Company, thereby insuring maximum efficiency in production and entire elimination of selling expense.

COLE INCREASES CAPITAL.

Output Will Be Doubled and Addition to Factory Is Contemplated.

The Cole Motor Car Company, Indianapolis, Ind., maker of Cole cars, has announced an increase in its capital stock from $500,000 to $1,000,000. This increase is due to the volume of business which has been gaining steadily the past three years, making it impossible for the company to meet orders.

The stockholders also approved the plans of President J. J. Cole to double the output and to build a large addition to the Cole factory. The stockholders present were: President J. J. Cole, Vice President S. J. Kuqua, Secretary and Treasurer J. F. Morrison, H. C. Lathrop of Indianapolis, W. L. Colt of New York City and E. C. Frady of Chicago.

FORM GRANT MOTOR COMPANY.

Men Well Known in Detroit Retail Circles to Manufacture New Line.

George D. Grant and Charles A. Grant, who as the Grant Bros. have long been identified with the retail sales branch of the industry in Detroit, have turned their attention to manufacturing, having been instrumental in the organization of the Grant Motor Company, which will produce a new line of small cars under that name. The officers of the concern are: President, George D. Grant; vice president and sales manager, Charles A. Grant; secretary and treasurer, David Shaw; factory manager, George F. Salzman; chief engineer, J. M. Howe.

The car is not new in the strict sense of the word, since the first vehicle of this design was produced something like a year ago in Mishawaka, Ind. The designer is Mr. Salzman, who formerly was identified with the E. R. Thomas Motor Car Company of Buffalo, N. Y. After testing the machine over the roads in Indiana and southern Michigan Mr. Salzman drove it overland to Detroit, where he succeeded in interesting the Grant brothers in the possibilities of its manufacture in the future.

NEW DEPARTMENT HEADS.

Something Concerning the Men Who Direct Policy of Standard Welding Company.

The recent changes in the official personnel of the Standard Welding Company, Cleveland, O., maker of Stanweld rims, etc., as announced in a recent issue, place at the head of the various departments men who are well known throughout the industry. J. G. Manternach, the new general manager, has been sales manager since 1910. He began his automobile experience with the Pope Manufacturing Company, Hartford, Conn., in 1897, and subsequently joined the forces of the Shelby Steel Tube Company and the National Tube Company. With the last named organization his promotion was so markedly rapid that it brought him to the attention of a number of concerns, among which was the Standard Welding Company. He succeeds Tracy W. Guthrie, resigned, formerly president of the Republic Iron & Steel Company, Youngstown, O.

S. W. Hartley, the new sales manager, has been prominently identified with the engineering end of the automobile industry since its inception in the United States. He is a graduate of Cornell University and has held responsible positions with the Peerless Motor Car Company, Cleveland, O.; the Garford Company, Elyria, O., and the A. O. Smith Company, Milwaukee, Wis.

H. S. Bryant, who becomes consulting engineer, claims to have designed the first quick detachable rim in America. He has been with the Standard Welding Company for the past two years. He formerly was the founder of the Bryant Rim Company, Columbus, O., which was purchased outright by the Diamond Rubber interests some years ago.

F. R. Wilhelmy remains as auditor and credit manager, to which position he has arisen by successive steps through 14 years of service with the company. C. C. Gressel is made superintendent. He has held high positions with the factory organization of the company since its inception some 15 years ago. H. E. Butcher remains in charge of the tube department.

Department Heads with the Standard Welding Company: Left to Right, J. C. Manternach, General Manager; S. W. Hartley, Sales Manager; R. S. Bryant, Consulting Engineer; F. R. Wilhelmy, Auditor and Credit Manager.

CHEVROLET BUYS LITTLE.

Detroit Advices Indicate Complete Adjustment of Plans for Two Concerns.

According to information from Detroit, the Chevrolet Motor Company, Detroit, maker of Chevrolet cars, has purchased the entire business of the Little Motor Car Company, Flint, Mich., maker of Little automobiles, and the complete line of cars formerly made by both companies will hereafter be known as Chevrolet machines. Two large factories will be in operation by August and will start production on 8500 cars for the 1914 season. The plant formerly operated by the Imperial Wheel Company and recently purchased by the Chevrolet Motor Company, will be devoted exclusively to the production of a roadster.

It is understood that A. B. C. Hardy has been made general manager of the enlarged company, and the operations will be centralized at Flint with the sales force and executive offices at Detroit. E. S. Johnston will remain sales manager. The Chevrolet Motor Company has an authorized capital of $2,500,000, with the following officers: President, C. M. Begole; vice president, W. C. Durant; second vice president and general manager, A. B. C. Hardy; secretary, C. R. Hathaway; treasurer, W. S. Ballenger.

The Republic Motor Company of Michigan, organized to conduct the sale of both Chevrolet

Digitized by Google

and Little cars, is expected to remain in charge of the sales until the expiration of its contract, when it will be merged with the Chevrolet Motor Company under the same name.

TWO NEW HAVERS MEN.

W. K. Hadley and George Blaitwaite Join Forces of Port Huron Concern.

Two important additions have been made to the organization of the Havers Motor Car Company, Port Huron, Mich., maker of Havers cars. W. K. Hadley, who for seven years has been associated with the Maxwell Motor Company and more recently with the Marion Motor Car Company, Indianapolis, Ind., maker of Marion machines, becomes manager of the eastern district, with headquarters in the company's New York City offices at 64th street and Broadway. He is a man of much experience in the motor car field.

The second addition is George Blaitwaite, one of the foremost men in the production branch of the industry. He has been building high grade cars for the past nine years, having been identified during that time with the Stevens-Duryea Company, Chicopee Falls, Mass., maker of Stevens-Duryea cars. He has held the position of factory superintendent and is admittedly one of the country's best builders. The Havers company has received many congratulations since it became known that Mr Blaitwaite had been secured as an addition to its organization.

CARRIAGES AND WAGONS.

Census Figures Indicate Manner in Which Automobiles Affect Industry.

According to the figures of the United States census of 1909 for the carriage and wagon industry, detailed statistics of which will be published in bulletin form shortly, the number of complete vehicles of all classes manufactured by the establishments in the industry increased from 1,594,465 in 1899 to 1,711,529 in 1904, but decreased to 1,519,782 in 1909. It thus will be seen that the decrease for the decade was 4.7 per cent. and for the last five-year period, 11.2. The value of the vehicles produced, however, was somewhat greater in 1909 than in 1899.

The 5492 establishments in both branches of the industry in the United States gave employment in 1909 to an average of 82,944 persons. The total value of products was $77,941,259, but it is explained that a considerable part of the value reported represents receipts for repair work. The report says in part:

> The carriage and wagon industry has existed in this country since early colonial times, and its growth up to the census of 1904 about kept pace with the increase of population. The advent of the automobile, and later of the motor truck, has had a decidedly retarding influence on the industry. Many establishments reported at censuses prior to 1909 or 1904 as manufacturing carriages and wagons have since turned wholly or in part to the manufacture of automobiles and have been classified under the automobile industry.

The business is well distributed throughout the country, establishments being reported from every state except Nevada. In 1909, as well as in 1904, Ohio ranked first in respect to both value of products and value added by manufacture, while in 1904 it ranked first in number of wage earners also. Indiana ranked second as to value of products in both years, and first as to number of wage earners in 1909. The accompanying table gives the figures in detail as applied to the number of people employed, capital invested and other important factors of the industry.

CENSUS FIGURES FOR CARRIAGES AND WAGONS.

	Number or Amount			Per Cent. of Increase*	
	1909	1904	1899	1899-1909	1904-1909
No. of establishments	5,492	5,588	6,792	-19.1	-1.7
Av. No. persons employed	82,944	90,751	†	....	-8.6
Av. No. wage earners	69,928	77,882	73,812	-5.3	-10.2
Capital	$175,473,728	$152,344,657	$128,961,660	36.1	15.2
Wages	37,594,919	38,362,679	33,565,313	12.0	-2.0
Value of products	159,892,547	155,868,849	138,261,763	15.6	2.6

*A minus sign (-) denotes decrease. Where percentages are omitted, comparable figures cannot be given. †Comparable figures not available.

Since the advent of electric cars in the automobile field it has been quite generally thought that they were of little use for country driving, but this idea is being gradually dispelled by the performances that are now of frequent occurrence, which prove the electric machines are road cars of ability. Recently J. L. Hill, who handles the electric department for the Archey-Atkins Company, Detroit, delivered to Mrs. J. E. P. Holland at Bloomington, Ind., a four-passenger, forward drive Detroit electric, made by the Anderson Electric Car Company, Detroit. The machine covered the entire distance of 75 miles over bad roads in six hours, which is considered of great importance in proving the stability, efficiency and worth of the product of the Anderson company.

NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS

Apco Master Vibrator No. 3.

The Auto Parts Company, Providence, R. I., manufacturer of Ford specialties, has augmented its extensive list by a new master vibrator termed the No. 3. The company has had considerable experience with master vibrators, having previously marketed two designs, and states that the new instrument is superior in every respect to former models in that it is not only more compact, but produces a hotter spark with less consumption of current. The last named feature will appeal to Ford owners whose cars are fitted with electric lighting as a better light is obtained at low speeds. The new master vibrator is but 1.5 inches thick, 3.5 wide and five high, dimensions permitting of installation under the hood if desired, thereby eliminating possible obstructions from the dash. The case is of mahogany, highly finished, and the removable cover is accurately fitted, excluding dirt and moisture. All exterior components, such as locking parts, terminals, etc., are heavily nickel plated. The adjusting screw of the vibrator includes a special locking device, and the contact points are unusually large, assuring long life with minimum care. Particular attention has been paid to the windings and these are designed to withstand the high voltages generated by the flywheel magneto. Although constructed especially for model T Ford automobiles the master vibrator may be utilized with any coil system of ignition where the source of current is a battery or a low-tension magneto. Not only does it synchronize the spark, making for more power and flexibility, but starting is made easy, as each cylinder is assured a hot spark. Although the Apco vibrator is the lowest priced instrument marketed, the best of material and workmanship are incorporated, and it is guaranteed.

Economy Spring Truss.

The Economy spring truss is manufactured by J. C. Moore & Co., Racine, Wis., and is designed to be carried in the car for emergency when a spring breaks. It is slightly arched in the centre and carries a clamp and bolts at each end, the former being provided with a number of openings to fit different sized springs. In practise the centre of the truss is placed over the break and the bolts of the clamps tightened.

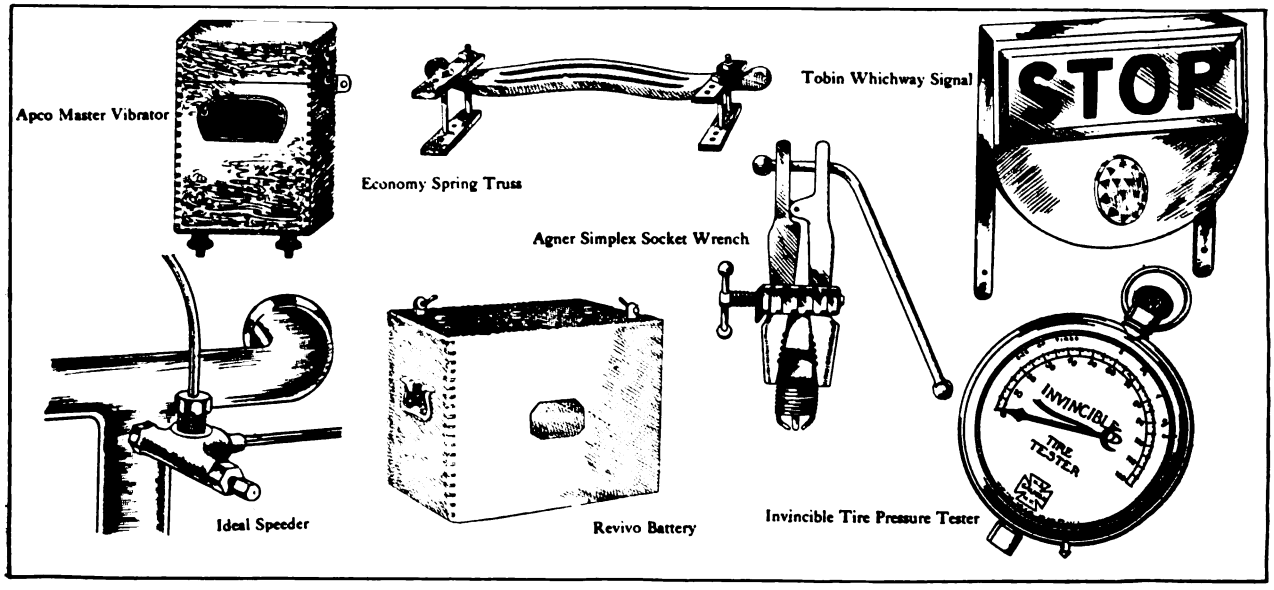
Tobin Whichway Signal.

A large number of rear-end collisions take place because of the inability of the operator of the leading car to notify the approaching vehicle when a stop is to be made. This is especially true in the evening when driving in congested traffic. The Tobin Whichway Signal Company, 50 Walker street, New York City, is marketing the Tobin Whichway signal, which presents practical features in that whenever the machine is slowed down or stopped the word "Stop" is automatically illuminated. It is a combination license tag holder and rear light operated by electricity, and includes the usual red semaphore. The word "Stop" is ground in red glass and the lamp is made of brass reinforced with a heavy piece of steel. Inside the lamp, which is constructed to withstand severe service, are two electric bulbs, one illuminating the semaphore and number plate continuously, and the other the signal. Control of the latter is by an automatic switch which may be attached to either the clutch or brake.

Ideal Speeder.

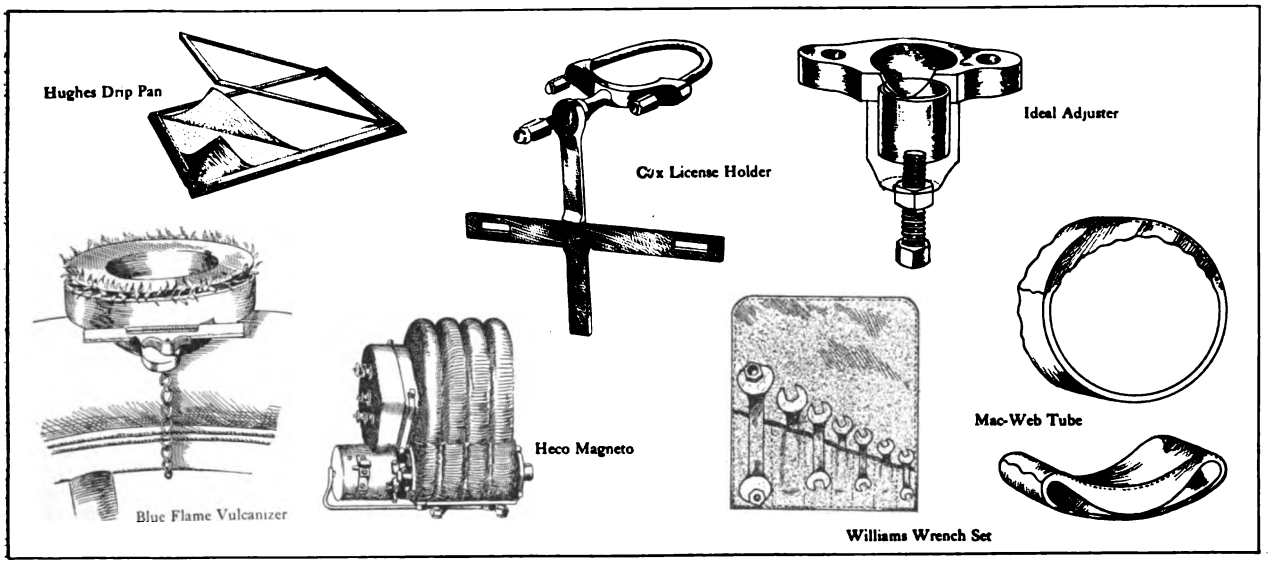
The high price of gasoline has resulted in the marketing of a number of devices for controlling the mixture by introducing auxiliary air into the intake manifold. One of this type is the Ideal speeder, marketed by the Interstate Auto Accessory Company, 2124 East Washington street, Indianapolis, Ind. It comprises a valve device which is screwed into the intake manifold and the opening is controlled by a dash adjustment. Heated air is utilized to break up any particles of raw gasoline as well as to correct the mixture, a tube being placed in proximity to the exhaust pipe. The speeder is constructed to be utilized in combination with a primer which is mounted on the dash and manually operated.

Revivo Storage Battery.



The Revivo storage battery is the product of the Cook Railway Signal Company, Denver, Col., and differs from the usual types of lead batteries in that it is a dry member, no fluids being utilized for an electrolyte. It is claimed by the maker that the battery may be entirely discharged and that recharging will bring it back to its initial efficiency. It is charged in the same manner as wet batteries and it is maintained that overcharging is not injurious. It is made in several sizes and capacities.

Agner Simplex Socket Wrench.



The R. C. Agner Company, Burlington, Wis., is manufacturing the Agner Simplex adjustable socket wrench, which presents interesting features in that it may be utilized for a number of purposes. It is especially adapted for removing and replacing spark plugs, having as it does a pair of movable jaws which are locked by a small clamp. It may also be utilized on square or hexagonal nuts and bolts, or as a tap wrench. Another feature of the device is that it can be employed as a small hand vise. It is constructed of high grade material.

Invincible Tire Pressure Tester.

Lack of proper inflation is the greatest abuse of tires and to secure maximum efficiency from the casings the air pressure should be tested from time to time. The United States Gauge Company, 67 Wall street, New York City, is marketing the Invincible tire pressure tester, which is a self-recording instrument and one easily oper-

Digitized by Google

ated. It is similar in size and shape to a watch and may be carried easily in the pocket if desired. The dial is calibrated, registering in pounds from one to 120, and the proper inflation values for different sized casings are included. When taking a reading the hand remains at the maximum pressure until released by pressing a button. This is of convenience when inflating tires at night as the instrument can be carried to the nearest lamp and read.

Hughes Drip Pan.

The Foss-Hughes Company, Philadelphia, is marketing the Hughes drip pan, which was designed by A. E. Hughes for service in the salesrooms of the concern. It differs from the conventional pans in that an oiled paper is utilized to catch any lubricant that may drip from the motor, etc. The invention comprises a number of individual sheets of paper formed into a pad and held in a wooden frame by an iron member. Upon a sheet becoming soiled it is removed, exposing a clean one. It is especially designed for service in salesrooms, although equally applicable to the private garage.

Cox License Number Holder.

The Cox Brass Manufacturing Company, Albany, N. Y., is marketing what is known as the bracket A, a license number plate holder, arranged to retain two tags if desired, as when travelling in two states. The plate may be attached to either side of the front bracket, which by removing a nut on the top of the shank can be reversed easily. The holder is made of brass.

Ideal Ford Adjusters.

John A. Vansickle, 2122 East Washington street, Indianapolis, Ind., is manufacturing the Ideal adjusters, which are constructed in two sizes and designed especially for model T Ford automobiles. They are practically adjustable ball and socket joints and when fitted to a car permit of taking up all play, thereby preventing lost motion as well as eliminating annoying rattles. The larger size is used for adjusting the front end of the radius rod, while the smaller is employed on the steering gear connecting rod. The device is provided with a set screw and lock nut and by turning the former a very fine adjustment may be made. The Ideal adjusters are constructed of a high grade material and are guaranteed indefinitely. They do not require any special tool for attachment and may be applied by the most inexperienced.

Blue Flame Vulcanizer.

The Blue Flame vulcanizer is the product of the C. M. Beardsley Manufacturing Company, 1911 Euclid avenue, Cleveland, O., and differs from the conventional types of portable devices burning gasoline in that a thermometer is incorporated, enabling the operator to control the temperature of the heat. The vulcanizer is cup shaped and the fuel receptacle is provided with a wick to absorb the greater part of gasoline which when ignited gives off a blue, smokeless flame. Control of the heat is by a cover holding the temperature to the proper vulcanizing point, which is noted by the mercury in the thermometer. The vulcanizer is constructed in two parts, secured together by thumb screws, and is also equipped with a chain for vulcanizing tires on rims. The ouft includes, in addition to the vulcanizer, a specially prepared quick curing cement and rubber.

Heco Magneto.

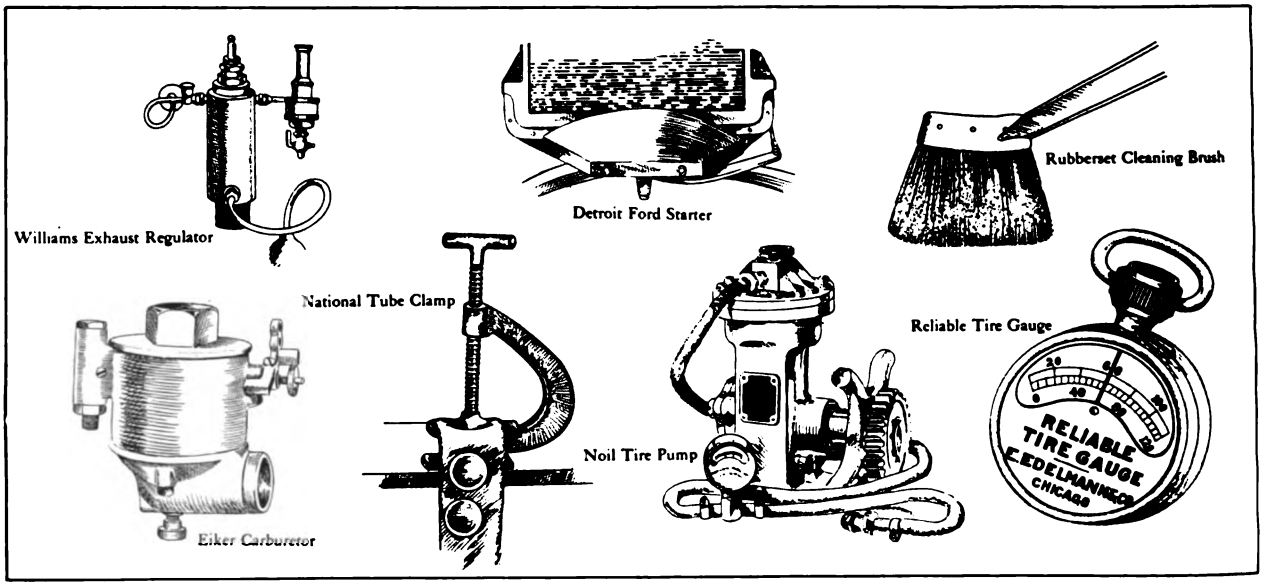
The Heco magneto is manufactured by the Heinze Electric Company, Lowell, Mass., and is distinguished easily from other makes by the shape of the magnets, these being round instead of rectangular. The company maintains that the round magnet provides a more perfect contact with the pole pieces and that the end of each magnet is ground and fitted to reamed holes in the pole members. The best tungsten magnet steel is utilized and the armature is of high grade magnetic iron, carefully annealed. The bearings are of the annular ball type and the make and break case is constructed of steel tubing with fibre insulation, the latter being shrunk onto the outside. The points are ample in size, of platinum iridium, and the cam is chrome nickel steel, carefully ground and hardened. The make and break cover is removable without the use of tools. The distributor case is of hard vulcanized rubber and the terminals are of the detachable type and are covered with hard rubber. The advance lever is located on the breaker box and is furnished either on the right or left hand side. The provision for lubrication is such that the magneto will run for months without attention. The magneto is termed a low-tension instrument because it produces a low voltage from the armature, which is stepped up by means of a coil having primary and secondary windings. The high-tension current is distributed to the different plugs by the magneto. The dash coil furnished with the magneto is of mahogany, nicely finished, and the coil is equipped with a small kick switch and push button for starting under compression. A coil for mounting under the hood is also manufactured. When the independent dual ignition system is required, a four-cylinder coil is supplied, it having a switch so that either batteries or a magneto may be utilized independently or together. The Heco is constructed for one, two, four and six-cylinder motors. Owing to the special method of winding the secondaries the product of the company is guaranteed against burning out or breaking down.

Williams Wrench Set.

The Waite Auto Supply Company, Providence, R. I., is marketing the Williams wrench set, which is made in two numbers, eight and nine respectively, these differing only in that a spark plug wrench is omitted with the smaller numbered outfit. The wrenches are drop forged and are designed to fit bolts and cap screws of varying standard measurements. There are seven wrenches to each set and these have milled openings of different sizes and are sufficient to meet every requirement that may be encountered in motor car work.

Digitized by Google

Mac-Web Pneumatic Tube.



The Mac-Web pneumatic inner tube is manufactured by the Webster-Macdonnell Company, Haverhill, Mass., and it is held that it is not only puncture proof, but that it provides all the advantages of the conventional types of tubes. It is constructed with a strip of fabric running its entire length and a thickness of rubber over the fabric. When removed from the mandrel it is turned inside out and spliced. When punctured it is stated that the rubber tread will compress, sealing the opening.

Rubberset Cleaning Brush.

The Rubberset Company, Newark, N. J., is manufacturing a brush called Rubberset, which is made especially for removing oils, greases and dirt from the power plant and other components of the motor car. The brush proper is hatchet shaped and the bristles are extra stiff, making it possible to displace hard deposits. The bristles are gripped in hard vulcanized rubber.

Williams Exhaust Pressure Regulator.

The D. T. Williams Valve Company, Cincinnati, O., is manufacturing the Williams exhaust pressure regulator, which is designed for use on cars equipped with pressure fuel feed systems. Its function is to catch all dirt, moisture, etc., and to cool the exhaust gas before the latter passes to the tank. The device is provided with an adjustable valve which relieves the system of any excess pressure and assures a uniform feed at all times.

The regulator is attached to the dash under the hood in a vertical position and the gas is led to it by a tube. The gas enters the regulator through a lower connection, passes upward, then downward over a series of ribs inside the casing, and all foreign elements are separated, falling to the bottom cap, which is removable. The exhaust in its course passes upward through a very fine mesh screen, where it is again filtered.

Detroit Ford Starter.

The Detroit Mechanical Starter Company, Detroit, is manufacturing a mechanical motor starter for model T Ford cars. It is operated from the seat by a nickeled lever located beside the emergency brake member, the former being connected with a sector and pinion gear just in front of the dash. The starter mechanism proper replaces the usual crank and does not detract from the appearance of the machine, it projecting but six inches. When the lever is moved connection is made between the crankshaft and a shaft of the starter, and a further movement of the hand lever turns over the motor by the application of considerable leverage through a gearing. The device weighs but 20 pounds and not only is it easily installed, but it is claimed that but little effort is required to crank the motor.

Eiker Carburetor.

The Eiker carburetor, manufactured by the Eiker Carburetor Company, 1790 Broadway, New York City, differs from the conventional types of vaporizers in that the spray nozzle is located in the middle of the throttle disc and a tapered adjustable needle moves backward and forward, automatically increasing or decreasing the supply of fuel with the opening and closing respectively of the throttle. The maker holds that the construction eliminates the necessity of a venturi tube or extra jets. It has but one air inlet, the air passing upward across the spray nozzle, and as the latter is located in the centre of the mixing chamber it is pointed out that its efficiency is not affected by grades, etc. It is also stated that water and sediment in the fuel cannot clog the spraying nozzle, as the inlet port of the feed pipe is .5 inch below the level of the gasoline. The base, which includes the auxiliary air valve, air intake and hot air connection, adapts itself to four different positions making for convenience in installation. There are but two adjustments, the fuel and air, and it is said that the carburetor is set easily and is applicable to all types of motors. Easy starting qualities, economy of fuel and flexibility are emphasized with the Eiker.

National Tube Patching Clamp.

The National Cement & Rubber Company, Toledo, O., is marketing an inner tube patching clamp which is stated to mend a puncture in four minutes at a slight cost. The clamp requires no heat, acid, etc., as it welds the self-curing rubber cement to the tube by the cold process. The equipment includes in addition to the clamp which makes a neat repair, a can of self-curing rubber cement.

Reliable Tire Gauge.

E. Edelmann & Co., 225 West Illinois street, Chicago, is marketing the Reliable tire gauge, which is very compact and in watch form. It registers the air pressure from zero to 120 pounds and is provided with an indicator hand which stops when the maximum pressure is registered. The hand can be reset to zero.

Taylor Noil Tire Pump.

The Taylor Manufacturing Company, box 485, Chicago, is marketing the Noil pump, so named because all lubricant or oily vapors are eliminated, nothing but pure, fresh air being forced to the shoe. It is a mechanical pump of the stationary type and is secured to the power plant of the car by a simple little bracket, this and the necessary gears being supplied as regular equipment and to meet the requirements of installation. The pump works on the plunger-diaphragm principle and the air chamber is independent of the crankcase, being separated from it by an air-tight rubber diaphragm. The pump is but 7.5 inches high, weighs but 6.5 pounds and is constructed of aluminum and bronze. It is held it will deliver from 90 to 150 pounds of air when operated at low speed on the average motor and that it may be fitted in from 15 to 40 minutes, depending on the design of the power plant. The equipment includes suitable length of hose and pressure gauge.

THE FRICTION TRANSMISSION.

A Cartercar Owner Gives Some of the Reasons Why He Favors This Type.

Many manufacturers of automobiles are free to admit that much of the success attained by their product has been the result of intelligent criticism and discussion on the part of owners. H. R. Radford, vice president and general manager of the Cartercar Company, Pontiac, Mich., credits one of the Cartercar owners with having submitted one of the best technical articles ever written about this make of machine. The argument is in part as follows:

The chief criticism offered and the basis of all argument against the Cartercar is the fact that "It has a friction transmission." This is the only "true" indictment ever brought against the Cartercar by its competitors and the ground over which the fight for supremacy is being waged.

Every fair minded person, whether he be familiar with the details of automobile construction or not, will admit that in any piece of machinery designed to do work, the more direct it is in the principle of its operation and the more simple it is in its mechanical construction, the more certain it is to be reliable. Out of reliability we must expect a maximum of service and service in its fullest sense is what is embodied and realized in the Cartercar friction transmission. It is a transmission of innumerable speed ratios and through each and every one of them the very maximum of power and efficiency is delivered to the rear axle.

Methods and principles in mechanical construction used and handed down from one era to another have always been difficult to cast aside and it has always required some mechanical Martin Luther to break away from the tenets of the faith before more advanced and efficient methods could be established and come into practise. Those who are championing the cause of gear transmission will tell the prospective buyer that friction transmission is a new and unreliable method and that it has not proved a success, either not possessing the knowledge, or purposely evading the fact that friction is now being successfully used in transmission of power in some of the heaviest machinery, it being more flexible and more efficient than any method ever used.

As a convincing example of the thorough practicability of friction transmission and its wonderful efficiency, just consider for a moment the operation of the great railways of the country. How many stop to consider how the billions and billions of tons of heavy freight are moved and how our lightning passenger service is accomplished? It is all done by friction transmission of power through the great driving wheels against the rails.

SEVERE MOTOR TEST.

Chicago Man Runs Continental Engine Over 160,000 Miles in His Car.

Edward B. Ellicott of Chicago seven years ago purchased a Continental motor, made by the Continental Motor Manufacturing Company, Detroit, and sufficient other parts to assemble a touring car which would fulfill his ideas of what a real automobile should be like. Mr. Ellicott has used this car continuously winter and summer in and around Chicago. It has never been laid up for any purpose save for painting.

During the last seven years Mr. Ellicott has travelled over 160,000 miles, or more than six times around the world, without motor trouble of any description. The motor has never had any repairs save a few simple replacements which excessive use will wear out on any motor. This large total of running miles is an interesting testimonial to the endurance of the modern gasoline engine and to the Continental product in particular.

LUVERNE POWER PLANT.

Company Placing Fully Equipped Four-Cylinder Unit in the Market.

The Luverne Automobile Manufacturing Company, Luverne, Minn., has placed in the market a four-cylinder unit power plant, completely equipped, comprising a motor with carburetor and high-tension magneto attached, multiple disc dry plate clutch, selective type transmission with control levers and pedals attached and connected, ready for installation in any style of motor vehicle.

The company also equips this motor with electric generator and motor starter, if such is desired. The outfit is accompanied by a written guarantee for one year.

R-C-H TRANSCONTINENTAL TOUR.

Three Young Men on the Way from Los Angeles to New York.

Driving the second R-C-H car built by the R-C-H Corporation, Detroit, three young men of California, Eldon Rookledge, William West and Catine Corella, are making what is probably the first West-to-East transcontinental tour of the season. With New York City as the objective point they left Los Angeles, Cal., May 9, taking the southwest route.

The party has passed through Kansas City, Mo., and reported that no mechanical difficulty of any kind had been encountered. From Kansas City the tourists drive to Detroit, by way of St. Louis and Indianapolis, and then will travel East through Canada to New York. No attempt at records is being made and the trip is expected to take about a month.

William J. Bryan, Secretary of State, has taken delivery of a Studebaker touring car. This is Mr. Bryan's second Studebaker machine.

MECHANICAL NOTES FOR OWNERS.

Suggestion from Reader for Fitting Inexpensive Oil Gauge to Motor—Instructions for Adjusting Cole Lubricator—Novel Cause for Missing at Low Speeds.

EXCESS oil in the crankcase causes smoking and carbon deposits, while a lack of lubricant invites trouble in the shape of burned-out connecting rods, main bearings, etc. The fear of burning out connecting rods leads many motorists to use too much oil, and this is especially true if provision is not made for noting easily the amount of lubricant in the crankcase or sump. Even when petcocks are incorporated to show the level of the oil, some owners do not take the trouble to keep these members clean so as to be utilized as intended.

The maker of the modern motor fits a gauge and calibrates it so that it is a simple matter to ascertain at a glance the height of the lubricant, and to prevent flooding, which results in smoking, etc. There are, however, a number of old types of machines not thus equipped and the following communication from a reader is of interest in that he solved the problem of fitting a gauge to an old model power plant.

Suggestion for Home-Made Oil Gauge Contributed by a Reader: A, Showing Device in Position; B, the Parts and Method of Assembly.

Noting that you published a suggestion from a reader in your last issue, I am enclosing a sketch of an oil gauge which I fitted to my engine and trust that you will find it of sufficient merit to print same, as it may be of service to some fellow automobilist. The motor is a four-cylinder and is lubricated entirely by splash, the lubricant being fed by a pressure system to the crankcase. The only way I had of determining the height of the oil was to use a rod, which was inserted through a plug in the upper crankcase. As the hole was on a slant it was sometimes difficult to get a correct measurement.

The lower half of the crankcase had a petcock for draining off the old oil and I used the opening to fit the attachment as shown in the drawing. I fitted a T to this opening and screwed in the petcock at the bottom so that I could drain off the old oil as formerly. Into the T I screwed a short piece of pipe and to the free end of the tube attached an elbow. The gauge proper I made out of a piece of brass and glass tubing. The brass member was threaded to both ends and to the top was screwed a cap carrying a cork washer. The bottom cap was drilled and tapped to take a short piece of tubing, connecting the gauge to the elbow. The brass tube I filed as shown in the sketch and by using suitable thicknesses of cork washers on the ends of the glass tube secured an oil tight gauge.

Of course I had to ascertain the proper height of the oil in the crankcase before assembling the parts and this was done by removing the lower half of the crankcase, measuring from the centre of the crankshaft to the end of the connecting rod and allowing for the dip of the ends. I then had my pipe cut so that when the gauge was put together the oil would show within an inch of the top of the tube. By watching the exhaust and experimenting I ascertained the correct height in the crankcase, after which I cut a mark on the gauge with a file.

The gauge works fine and I am not troubled with smoking as formerly. It is a simple matter to raise the hood and see just how much oil is in the crankcase. After cleaning out the crankcase the gauge is a great help in refilling. The cost of the pipe, glass, etc., is slight and by having the threads cut all one has to do to fit it is to put the parts together. I also found that I am using considerably less oil than formerly and do not have to scrape out carbon as frequently as I did.

Suggestions from readers for simplifying repairs, adjustments, etc., as well as hints for constructing devices aiding in the maintenance of the motor car will be published in this department. The name of the contributor will not be used unless desired, but the name and address should accompany each article so that another reader may ascertain specific measurements when taking advantage of a mechanical suggestion. When possible the subject should be illustrated by a rough sketch and when necessary measurements should be given.

MISSING AT LOW SPEEDS.

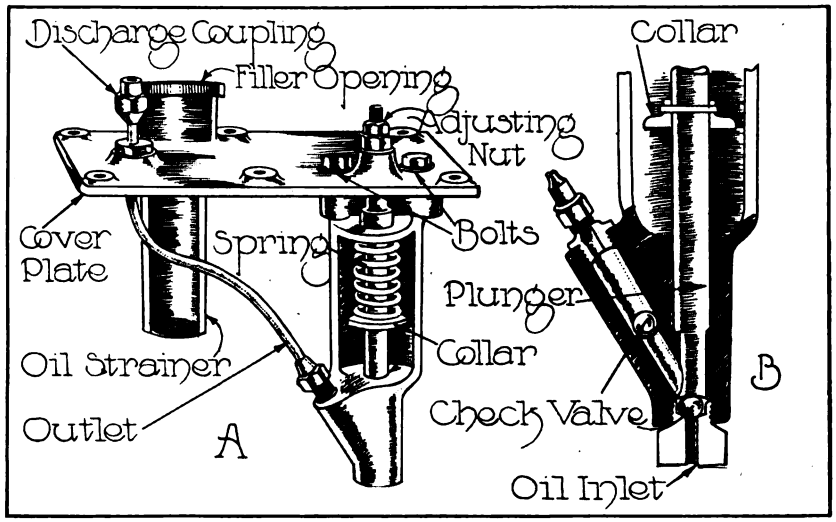
Missing of the motor at low speeds is due to a number of causes, including auxiliary air, improper adjustment of the carburetor, etc. A case of skipping which bothered an owner was noted recently in a car that had been in service but one season and the cause was not discovered for some little time as the high-tension cables appeared to be in first class condition. The engine ran erratically at slow speeds and changing the gap of the plugs and mixture failed to correct the trouble. The intake pipe and connections were tested for auxiliary air, but none was noted.

The ignition system comprised a magneto with the usual transformer and dry cells for starting. The miss was noticeable on both the batteries and magneto and the cells tested 18 amperes each. The distributor and breaker box were examined and cleaned, platinum points readjusted, but the missing was not eliminated. Driving into the garage one evening and when the lights were out, the owner on lifting the hood to make an adjustment to the carburetor, noticed a number of sparks playing about the magneto. An examination showed that the cables, which

Digitized by Google

ran very close to the magnets, were leaking high-tension current. The wires were wrapped with tape until new ones could be fitted and the troublesome skip disappeared.

ADJUSTING COLE OILER.



A knowledge of the components of the lubricating system and their operation will simplify the work of cleaning and adjusting. Although properly set at the factory the motorist may neglect to follow the instructions of the maker as to care and maintenance, resulting in inefficiency. Then again a different grade of lubricant may be used or conditions may arise when the amount of oil fed to the working parts requires augmenting. Dirt or lint may clog the filter member and pipes, necessitating cleaning of these parts.

In an accompanying illustration is shown the working parts of the lubricating system utilized on the Series Eight Cole cars and the adjusting mechanism is very simple, comprising a nut which is raised or lowered, increasing or diminishing the quantity of oil pumped. As will be noted the assembly is a unit and is removable. The pump member shown in detail at B is also removable, being secured to the cover plate by three bolts.

The fresh oil is poured into the reservoir through the filler opening and passes through a strainer, thence to the sump. The lower end of the pump body extends approximately to the bottom of the reservoir, oil entering by an inlet. The plunger of the pump has a collar secured to it, and also carries a spring. The collar serves a double purpose: First, to transmit the downward pressure of the spring, and second, to lift the pump piston when the eccentric which bears against its lower side rotates to the proper position. Thus it will be seen that the pump is raised by a cam and returned by a spring. Drive is by means of a worm gear from the camshaft, the reduction being 25:1, so that the pump eccentric cam makes only one revolution to 25 of the camshaft. The supply of lubricant is, therefore, proportional to motor speeds.

The operation of the system is simple. Upon the raising of the plunger oil is drawn in through the inlet and past the check valve. The latter is utilized to prevent the escape of the lubricant back into the sump when the plunger descends. On the down-stroke the oil is forced up past another check through a tube to the discharge coupling, thence to a sight feed on the dash. From the dash member it flows back to the crankcase, the circulation being maintained when the motor is operating.

To increase the amount of lubricant the adjusting nut is backed off or raised, permitting the plunger to make a longer stroke. To decrease the supply the nut is lowered.

Oiling System of Series Eight Cole Cars: A, Showing Adjusting Nut Controlling Stroke of Plunger; B, Plunger in Detail, Including Check Valves.

RENOVATING OIL LAMPS.

Unless the wicks are given attention and care is exercised not to turn them up too high, the interior of oil lamps will become smoked, especially the metal. If the finish is silver and it has become discolored, sometimes it is possible to restore it with a silver polish. If this treatment fails the finish may be made as good as new by utilizing a silver plating preparation, such as U-Kan Plate described in these columns a short time ago. When applied according to directions a brilliant surface is possible. The material is not expensive and a small bottle will keep the lamps in first class condition for some time.

CARE OF SHELLAC.

Shellac is useful in the garage and as it dries up very quickly it should not be exposed to the air. Place it in a bottle and fit a wooden stopper. The latter may be utilized for smearing the liquid when its service is required.

Digitized by Google

ADJUSTING RAYFIELD CARBURETORS.

RAYFIELD carburetors are produced in two models, D and H, by the Findeisen & Kropf Manufacturing Company, Chicago, and they differ only in that the former is water jacketed. An exterior view of model D is shown at Fig. 3, while a sectional view is presented at Fig. 1, with its components lettered. A little study of the construction and a brief description of its operation should enable one to clean and make adjustments.

A feature of the Rayfield construction and operation is the combination of its variable needle valve, automatic air valve and mechanical valve, the last named being connected to the throttle valve as shown in the drawing. The fuel enters through an inlet E and after being filtered at F passes the needle valve H and enters the float chamber A. When the predetermined level is reached the float D rises, and the needle valve descends, perventing further entrance of fuel.

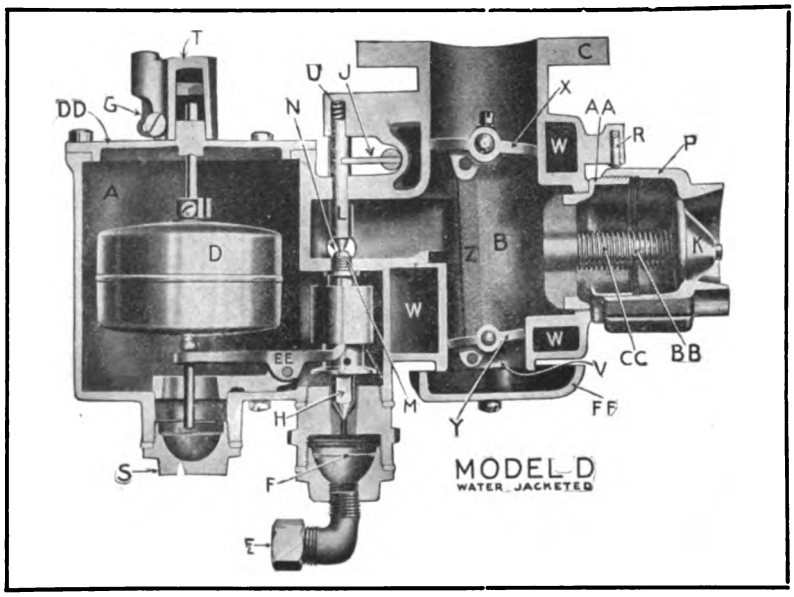


Fig. 1—Sectional View of Model D Rayfield Carburetor: A, Float Chamber; B, Mixing Chamber; C, Flange Connection; D, Float; F, Gasoline Intake Connection; G, Priming Lever; H, Gasoline Intake Valve; J, Needle Valve Lift; K, Automatic Air Valve; L, Needle Valve; M, Spray Nozzle; N, Constant Air Intake; P, Automatic Air Adjustment; R, Adjustment Lock; S, Drain Plug; T, Priming Cap; U, Needle Valve Spring; V, Mechanical Air Intake; W, Water Jacket; X, Throttle Valve; Y, Mechanical Air Valve; Z, Connecting Link; A A, Automatic Air Valve Cage; B B, Automatic Air Valve Spring; C C, Bumper Spring; D D, Float Cover; E E, Regulating Lever; F F, Regulating Lever Fulcrum; G G, Flushing Pan.

The gasoline enters the spraying nozzle M through openings, while the constant or fixed air enters at N, which is so constructed and arranged that the air currents pass directly over the spraying nozzle, drawing fuel therefrom. The flow of the fuel is controlled by the needle, which is actuated mechanically by the throttle valve X, and the opening and closing of the latter increases or diminishes the supply of gasoline proportionately. As the throttle is opened the mechanical air valve Y is also opened, as it is connected by a link Z to the member X. The mixing of the vapor with the air takes place in B. The automatic air valve is shown at K, it being adjusted by the member P and actuated by the spring B B.

The height of the float is set at the factory and should not require attention, but it may be that the adjustments have been tampered with or dirty fuel has been used. Under these conditions one is warranted in correcting the adjustments and eliminating the dirt. It should be remembered that many cars are equipped with the dash push button and this member should be pushed down.

The low speed is set first by turning the low speed screw (Fig. 3) to the left until the arm member above it and slightly to the right just breaks contact with the cam above that. Next turn the low speed screw 1.5 turns to the right, open the throttle about one-quarter, prime the carburetor and start the motor. In priming do not jerk on the primer member, but pull or press gently. Close the throttle until the motor runs slowly without stopping, then turn the slow speed screw to the left, cutting down the fuel, and do this one notch at a time until the engine idles smoothly. If it does not throttle or run slowly enough turn the screw in the top arm to the left, using a screw driver.

Open the throttle slowly until wide open. If the motor backfires turn the high speed adjusting screw to the right, a half-turn at a time, until the engine hits four cylinders and evenly. Should the motor not backfire, turn the high speed screw to the left until it does, then to the right until the engine runs smoothly. The low speed should not be touched after being set if the motor backfires with the throttle about one-quarter open, but the automatic air adjustment should be turned to the right a turn or two, increasing the tension of the

Digitized by Google

spring and decreasing the amount of air slightly. The air supply should not be tampered with unless the adjustment of the fuel members fails.

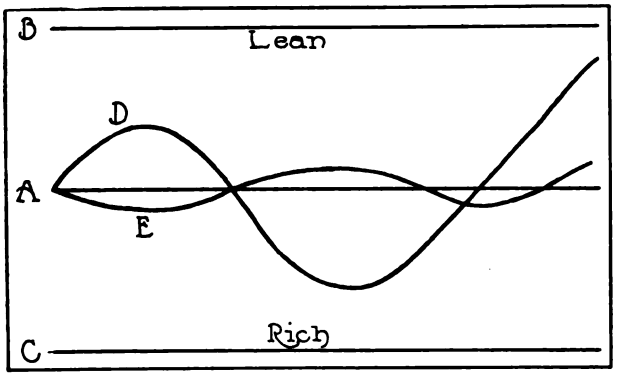

Fig. 2—Chart Showing Variation in Mixture with Minimum and Maximum Throttle—Curve A Represents Perfect Mixture; D, Effect of Climatic Changes, and E, That of Rayfield.

It is seldom necessary to change the nozzles in the Rayfield, but should it be necessary to turn the high speed cam adjustment to the extreme right to secure the best results, the nozzle is too small. If to the left, it is too large. A change to a nozzle two drill sizes larger or smaller will correct the trouble. Nozzles are numbered by all drill sizes, the No. 44 being larger than the No. 45, for example.

To remove the nozzle, displace the cover D D (Fig. 1) from the float chamber A and take out the float D. Remove the small screw in the bottom of the float chamber and take out the fulcrum lever E E through the float chamber. Unscrew the large plug at the gasoline inlet, being careful not to lose the copper gasket. The inlet needle valve can now be removed. Unscrew the nozzle M with a heavy screw driver and replace with the desired size. Reassemble in a similar manner, making sure to insert the round guide in the hole at the bottom of the float chamber before tightening the screw holding the fulcrum lever. Be certain that the latter moves freely before inserting the float.

If one is careful to determine that all fuel utilized is strained and to open the filter in the main line occasionally, one should not experience any trouble with the Rayfield provided it has been set properly. The maker states that many persons make the mistake of adjusting the Rayfield with too lean a mixture, an error made easily because of the simplicity to the adjusting members. The best results, insofar as efficiency and economy are concerned, are obtained when the mixture is rich enough to give all around good results. On the other hand, too lean a mixture makes the carburetor more sensitive to climatic changes resulting in a loss of power, etc.

It is further maintained that the Rayfield is not affected by high altitudes, provided, however, the nozzle is of the right size and the vaporizer set properly. For very high altitudes it may be necessary to set the automatic air valve so that it seats a trifle lighter and to cut down slightly on the low and high speed fuel adjustments. It is important, however, that the automatic air valve be seated when the motor is idling at low speed.

It is stated that the Rayfield has been driven from coast to coast, reaching altitudes as high as 10,000 feet without changing the adjustment. Its ability to withstand climatic changes is indicated in the sketch at Fig. 2. A represents the throttle opening from a closed to a full open position. It also shows a perfect mixture. B represents the point where the mixture is so lean that the motor will lose power and backfire. C shows a mixture so rich that not only will the motor miss, but operate erratically. The curve D shows a mixture first lean, then rich and again lean. The maker of the Rayfield claims that this is eliminated in its product as it follows the line shown at E, and that a considerable change in atmospheric conditions can be encountered before it will pass the limits C and B.

It is held that the best results are obtained in starting by not moving the throttle more than one-quarter way open. In extremely warm weather the use of hot water may be discontinued. The hot air connection may also be eliminated in warm weather.

Frederick H. Elliott, formerly secretary of the American Automobile Association and the Tour-

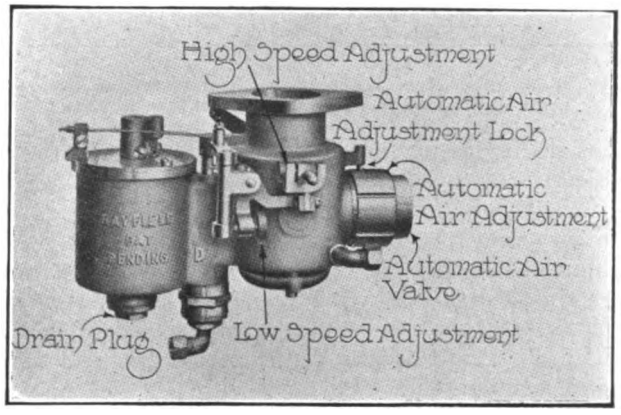

Fig. 3—Showing the Components Utilized in Adjusting Model D Rayfield Carburetors.

ing Club of America, has been elected to the board of governors and also general secretary of the International Travel Club.

WITH THE MOTORING INTERESTS ABROAD.

Single-Sleeve Valve Argyll Creates Many New World's Records on Brooklands Track ---British Apparatus for Testing Road Building Materials---Other Notes.

DETAILS of the world's record performance of the 15-30 horsepower Argyll car, made by Argylls, Ltd., Alexandria, Dumbartonshire, Scotland, on the Brooklands track, Weybridge, England, last month, which have reached this country within the past week or two, are of sufficient interest under any circumstances, but when it is remembered that the Scotch machine utilizes a single-sleeve valve engine, the event becomes all the more important. It is the first time that a sleeve valve engine of any type has secured world's records of this character.

In the first trials the Argyll set out to create new marks in the British class D, for machines with a piston displacement of 2868 cubic centimeters (approximately 177 cubic inches) or less,

W. H. Scott at the Wheel of the Argyll, Which Created New World's Records on Brooklands Track.

in which class there were no previous marks for a distance greater than 10 laps of the Brooklands track, about 27.5 miles. It not only created a new world's record, regardless of class, for 14 hours' running, but exceeded many of the marks in the British class E, for machines of not more than 2996 cubic centimeters (approximately 182 inches). Later it was determined to make a second attempt, in which all world's records above 500 miles of distance and from seven to 14 hours in time were exceeded.

It has been stated before in these columns that the British and American classes are so divided that it is not always possible to make definite comparison of the work done by machines in the two countries. The Argyll in question was fitted with a motor having a bore of 80 mm and a stroke of 130. These figures compare approximately with 3.15 and 5.125 inches respectively. This would just force the Scotch machine into the smallest American class, for cars with less than 161 cubic inches piston displacement.

There are no American records for longer distances, than 20 miles in this class. The mark for 50 miles in the 161-230 class is held by William Endicott in a Cole at 43:49.69. Under the stock chassis qualification Nelson holds the record for 50 miles at 50:36, and Knipper in a Chalmers for 100 miles at 1:40:46.81. By the accompanying table it will be seen that the Argyll exceeded all of these.

Class hour records are not claimed in America. The world's straightaway record for one hour is held by Ray Harroun in a Marmon at 74 miles, and the two-hour mark at 148. The marks exceeded by the Argyll from three to 12 hours were set by a Sunbeam last year. Those for 13 and 14 hours were held by S. F. Edge, who made them in a Napier in 1907.

It will be noted as well, that the Argyll's time for 500 miles was faster than that made by Jules Goux in the winning Peugeot during the recent 500-mile race at Indianapolis. While it will be admitted that the Brooklands track is in some respects faster than the Indianapolis speedway, it is of interest to compare Goux's 6:35:05 with the Argyll's 6:26:22.74, and Joseph Dawson's 6:21:06 in the National during last year's 500-mile race.

The Argyll was driven by W. H. Scott and L. C. Hornsted.

TESTING ROAD MATERIALS.

First Apparatus of Its Kind Now in Operation in Great Britain.

Just as in this country stationary testing machines for chassis and tires are taking the place of roadwork for automobiles, there is a British device for trying out road making materials without laying them where traffic actually is. The road board of Great Britain has sanctioned the construction of a road testing apparatus at the National Physical Laboratory, this being held to

Digitized by Google

be the first of its kind in the world. It is a building containing a circular track on which experimental lengths of roads can be laid readily and tested to destruction by the passage over them of wheels driven by motors which are guided and steered in a circular track by a revolving framework.

The machine, which took a year to design and construct, is now at work. The track has been filled with four lengths of water bound macadam, made up in four different ways, and each of these will be tested until it is broken up. The designers hope to be able to arrive rapidly at conclusions which otherwise would take years to reach on the actual roads themselves. The roadway is under cover and protected from weather influences, but it is possible to introduce certain of these conditions at will. For instance, the track can be heated by hot air blown onto it; rain can be imitated by spraying devices; it can be artificially cooled to the freezing point. Various machines and types of wheels will be employed in making the tests.

AMERICAN INVASION IN FRANCE.

Petit Journal of Paris Warns Local Manufacturers of Impending Danger.

That the so-called American invasion is a formidable danger was the main point in a recent editorial article presented in the Petit Journal of Paris, France, and local manufacturers were warned that it was necessary to combat American competition at once. The extent of the increasing popularity of the American product was evidenced by the statement that during the past two years the number of machines imported from this country had quadrupled.

The Petit Journal is of the opinion that the American automobile is becoming a formidable competitor of the French machine only because it is cheap. The article in question made extended reference to the fact that France was the home of the motor car and the country in which the automobile industry has attained large proportions. An appeal was made to local pride in an effort to stimulate active measures for the prompt meeting of competition from this side.

This situation has been uppermost in the minds of French manufacturers for at least a year. Early in 1912 representatives of these factories were sent to America with instructions to obtain information as to the methods utilized by the industry in this country, and only recently French makers began including in their advertisements that they were prepared to produce machines on the American plan.

NOTES FROM FOREIGN LANDS.

According to statistics recently made public in Paris, France, the number of horses in use in that city had dwindled from about 98,000 in 1900 to approximately 60,000 at the beginning of 1913.

As a mark of its appreciation of his services in the interests of motoring the German Society of Motor Manufacturers presented Prince Henry of Prussia with a handsome painting upon the occasion of his silver wedding recently.

Shortly after the running of the French Grand Prix event in July, the maker of the Sunbeam in England contemplates a series of trials on the Brooklands track utilizing a car fitted with a 12-cylinder V engine. It is understood that this motor has been produced primarily for use in aeroplane and motor boat work, but the track test has been decided upon as the best method of determining its value in every respect.

The Austrian Alpine contest which was originally scheduled for June 10-17, was postponed until June 22-29, in order that several German competitors might take part in the jubilee parade of cars before the Kaiser in Berlin during the first named week.

The success of the proposed standard car race on the Isle of Man in September is by no means assured, although the Society of Motor Manufacturers & Traders of Great Britain has removed its ban, insofar as this applies to privately owned machines. The Royal Automobile Club has explained its reason for fixing the rating at a low figure, on the ground that the course is dangerous for high powered machines.

While two years ago there were but two or three American cars owned in Switzerland, it is of interest to note that during 1912 about 50 medium priced American machines were sold in that country. According to the consular representatives in that country the time is opportune and the popularity of the cars already introduced is evidence of the fact that Switzerland offers a good field for the exploitation of American automobiles.

CORRESPONDENCE WITH THE READER.

Dead Axles.

(1598)—Is there any other car made besides the Metz that has a dead axle? I had an argument with a friend who says there are several pleasure cars made this way. Who is right? A. J. D.

San Diego, Cal., June 12.

The specifications of the 1913 pleasure cars published in the March 10th issue give four makes fitted with dead rear axles, these being in addition to the Metz, the Morse, Duryea and Mason A, B and C.

Planetary Type Motor Starter.

(1599)—Being very much interested in electric motor starters and having read the descriptions of the various makes published in your book and elsewhere, I would like to know if there is any system in which the power of the electric motor is applied on the principle of the planetary transmission. I believe that one of this kind would prove more satisfactory than the flywheel and timing gear methods. Kindly give complete details if such a system exists. SELF-STARTER.

New York City, June 12.

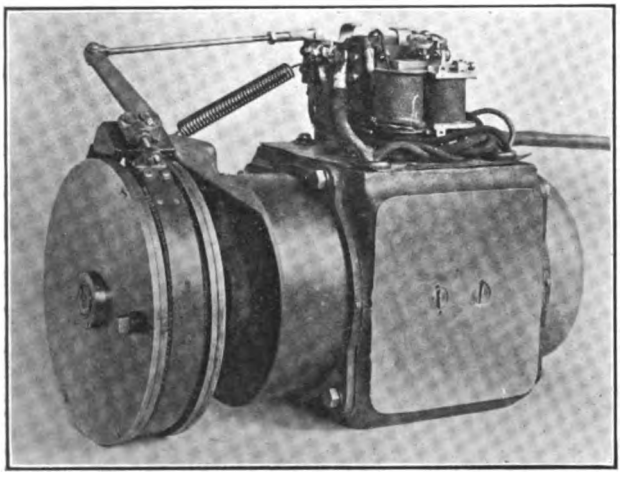

Fig. 1—Wagner Starter-Generator, Employing a Planetary Gearbox When Unit Is Utilized as a Motor Starter—It Operates on Much the Same Principle as the Planetary Transmission.

The Wagner Electric & Manufacturing Company, St. Louis, Mo., makes a combined lighting and motor starting system in which the energy of the motor starter is applied through a planetary type of gearing. The unit is shown at Fig. 1 and comprises four parts, namely: The starter-generator; the controlling mechanism, which changes the electrical connections of the apparatus from a motor to a generator; a gearbox and a storage battery.

The starter-generator consists of a four-pole field, each pole comprising two parts; a field coil of heavy copper strap, called the series field, and lying adjacent to it a field of finer wire, which may be termed the shunt field. The heavy copper windings are utilized when the unit is operating as a motor and the finer wire when employed as a generator.

Revolving in the four-pole field is a laminated toothed armature. This armature has a commutator at each end and is similar to the type utilized in street cars with the exception that two are fitted with the Wagner apparatus. The controlling mechanism consists of two parts, a cylindrical switch, resembling the drum switch employed in the street car controller and a small circuit breaker. The drum switch is of heavy construction and consists of a drum of high insulating properties on which are mounted contact segments. The contact fingers bear on these segments and the fingers are mounted on a condensite carrying board.

The switch is manually operated, either by the foot or hand, and its function is to change the electrical connections of the starter-generator from a motor to a dynamo at the proper time. The handle of the shaft of the drum controller usually works against a spring so that one has to hold against the spring to keep the controller in the starting position. When the actuating lever is released the spring pulls the drum switch back to the charging position. The drum switch has two points, starting and generating.

Mounted on this switch and forming an integral part of it is a small circuit breaker. It is of the automatic type and is so designed that when the generator attains a predetermined speed and the voltage is above that of the battery, the armature on the circuit breaker will be attracted, and, making contact, the current from the dynamo will flow to the battery. Similarly the connection is broken when the output of the generator falls below that of the cells.

A gearbox operating on the planetary type is mounted on the shaft of the generator-starter, and provides a high gear ratio between the engine shaft and the unit. The gear is locked to the shaft and runs freely with it and without speed reduction when the engine is running normal. When the controlling lever connected to the drum switch is pulled into the starting position, this lever tightens the brake band on the outside member of the planetary gear, causing the latter to operate, as the unit is then working as a motor, supplying energy to the engine shaft. Upon releasing the lever the unit becomes a dynamo.

The Wagner will run in either direction and the gearbox is so designed that it will not lock. This permits the engine to rock when coming to

Digitized by Google

a stop. It may also be run backward, and if the car be reversed with the starter connected, the gears will not be locked. The wiring is simple, there being but two leads, these connecting the unit to the battery.

Jacobson-Brandow Magneto.

(1600)—Will you kindly give me the wiring plan of a Jacobson-Brandow high-tension magneto on a Buick car? It has been wired to fire 1, 3, 4, 2. Why should it not fire, 1, 2, 3, 4? G. W.

Albany, N. Y., June 10.

The wiring plans of types J H and J L D Jacobson-Brandow magnetos are shown at Figs. 2 and 3 respectively, the former being of the true high-tension design, while the J L D is the dual system.

The true high-tension system eliminates batteries, coils and extra wires, but five leads being employed, these being one to each of the four spark plugs and another from the terminal on the breaker box of the instrument to switch and ground. The last named wire is a primary lead and is employed to divert the primary current from the secondary wires on the armature. When the switch is closed the current flows from the terminal through the primary wire to the switch, thence to the frame. The wiring plan is very simple, the heavy lines denoting the secondary leads and the fine the primary. The dotted lines represent the completion of the circuit through grounds.

The dual system shown at Fig. 3 differs from that illustrated at Fig. 2 in that a set of batteries and a transformer coil are utilized. When the source of supply is the battery the primary current is interrupted by the circuit breaker of the magneto and carried to the coil, where it is transformed into a high-tension. From the coil the converted current flows to the centre terminal on the distributor housing of the magneto, passing to each spark plug in proper sequence. When the magneto is supplying current the electricity flows from it to the coil, thence to the distributor. As with the other wiring diagram the high-tension cables are shown by heavy lines and the primary by light lines.

It would not be practical to have a four-cylinder motor fire 1, 2, 3, 4 as suggested because of a lack of balance of the crank arms, which would tend to create undesirable stresses and vibration. It should be borne in mind that with the four-cycle, four-cylinder engine each cylinder at all times is one stroke behind its predecessor. For example, when the first cylinder is firing the next to be utilized is compressing, while another is intaking and the fourth exhausting.

In the four-cylinder engine two pistons, connecting rods and cranks are always moving up at the same time the other two are moving down, which prevents shock from the movement of these parts. Four-cylinder motors fire either 1, 2, 4, 3 or 1, 3, 4, 2, and it will be seen that the force of the explosion or "kick" is more evenly distributed than it would be if the engine fired 1, 2, 3, 4, as suggested. Furthermore, it requires one complete revolution of the crankshaft to obtain two strokes and two revolutions before one firing or power stroke is obtained.

Crankshafts.

(1601)—Is there a concern in the New England States that makes crankshafts to order for automobile engines? L. F. W.

Keene, N. H., June 18.

Three concerns in Worcester, Mass., W. H. Leland & Co., 1025 Southbridge street; Norton Grinding Company and Wyman & Gordon Company handle finished and machined crankshafts. The Billings & Spencer Company, Hartford, Conn., manufactures crankshafts.

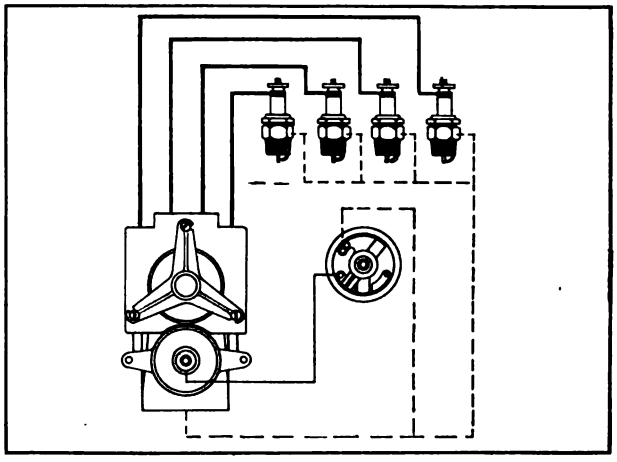

Fig. 2—Wiring Diagram of Jacobson-Brandow True High-Tension Magneto.

Desires Small Spark Plugs.

(1602)—Will you be kind enough to inform me where I can buy very small spark plugs? I want them of as small a diameter as is possible in a practical plug. I want them for experimental purposes in small cylinders. They must be smaller than .5 inch or .625 inch. SUSCRIBER.

Milwaukee, Wis., June 15.

There are a number of makers of spark plugs who will supply you with the information desired. A list of these will be found in the Classified Buyers' Guide, published elsewhere in this issue. The writer recalls a very small plug which he noted at the New York show and believes that it was a souvenir plug which was presented by A. R. Mosler & Co.

Digitized by Google

Trouble with Carburetor.

(1603)—I would like your advice on carburetion. I have a six-cylinder Apperson car on which I have an 1.5-inch Stromberg A 3 carburetor. All I can get is 6.25 miles to a gallon, although the carburetor is set as lean as possible without sacrificing power. Would you advise me to change it and try some other make?
SUBSCRIBER.

Elmhurst, L. I., N. Y., June 20.

If the mileage is not satisfactory and all other components of the car are in proper condition a different make could be tried out, but before going to the expense it would be advisable to take the matter up with the Stromberg Motor Devices Company, Chicago. It is possible that it may be able to offer some suggestions as to the cause of trouble.

Experiences Spark Plug Trouble.

(1604)—I have a model T Ford which has given excellent satisfaction up to the present time. Now I am bothered by the spark plugs of the first and second cylinders becoming fouled with oil. I changed the grade of oil but the trouble continues. A repairman tells me I need new rings and possibly pistons. Is there any way of remedying the trouble without going to this expense?
READER.

Westerly, R. I., June 16.

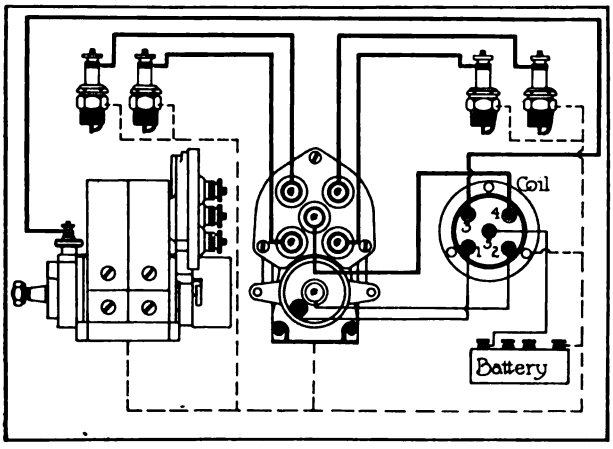

Fig. 3—Wiring Plan of Jacobson-Brandow Type J L D Magneto Providing a Dual System.

The presence of oil on the plugs denotes that too much lubricant is being used, or that it works past the rings. Fitting new members and pistons might cure the trouble, but this is not necessary according to the A. C. Danver Company, Borden street, Providence, R. I., which concern claims to eliminate it without new rings and pistons or altering the power plant.

Single and Double U & H Magneto.

(1605)—Can you inform me if the U & H magneto is made in any other form than the true high-tension type?
REPAIRMAN.

Boston, Mass., June 11.

The U & H magneto is made in two forms, single and double. Both are of the true high-tension type and the double instrument is practically two magnetos coupled tandem. It is designed to deliver two simultaneous sparks.

Q D Shoes on Clincher Rims.

(1606)—Is it possible to use quick detachable types of shoes on clincher rims? One party informs me that the Q D tire cannot be fitted because of the stiff bead. Another says that it can. Is it possible?
ARGUMENT.

Austin, Tex., June 19.

Q D tires are not designed for service on clincher rims, but may be fitted. It will require more or less muscle to force the bead over the rim and it is doubtful if one is warranted in trying the experiment owing to the trouble in replacing the shoe after a puncture, etc.

Adjusting Ford Steering Gear.

(1607)—I have an early model Ford car and after overhauling it find that I cannot turn the steering wheel to the left as far as to the right. This bothers me when turning around as the left wheel does not turn as much as the right. The arm carrying the ball joint of the rod connecting it with the steering arm on the wheel touches the right spring when moved to the extreme right position. What is the cause and how can it be fixed? The gear is a cup shaped bronze member in which fits half a gear.
PUZZLED.

Rockford, Ill., June 11.

Although the model of car was not mentioned it is presumed that the steering gear is of the worm and gear type, the ball end referred to being secured to the gear. The arm carrying the ball is too close to the spring, or in other words, the gear was replaced in the internal worm with the arm too far to the right. Remove the gear, rotate the steering column and remesh the gear until the arm is parallel with the side frame. It may be necessary to so mesh the gear that the arm will be a trifle to the left to obtain the desired equal movement in either direction.

MUDLARKS' ANNIVERSARY BANQUET.

Planning Reunion of Those Who Participated in New York-Pittsburg Run.

R. H. Johnston, New York manager of the White Company, is taking the initiative in organizing a reunion of all those who took part in the memorable New York-Pittsburg endurance contest in 1903. The 10th anniversary of the event will occur in October and it is planned to bring together at a banquet the entire number of those who participated under the title of Mudlarks.

The Mudlarks' mileage medal will be awarded to the one who travels the greatest distance to attend the banquet; the Mudlarks' musical medal to the one who composes the best song relating to the run, and the Mudlarks' mirthmaker medal will be given to the one who is voted to have told the best anecdote.

Digitized by Google

The following Mudlarks are those who will serve on the committee of arrangements: H. W. Perry, Harry Unwin, John C. Wetmore, New York City; Howard G. Reynolds, John C. Kerrison, Boston; Webb Jay, Chicago; Windsor T. White, Frank B. Stearns, Cleveland; F. Ed. Spooner, Detroit.

A DAY IN THE COUNTRY.

Motoring in Westchester County, New York, in a 1913 Reo the Fifth.

Motorists in New York City are fast learning to appreciate the beauties of a drive through Westchester county in the spring and early summer. There are few sections in the immediate vicinity of the metropolis which offer such pleasant country drives. An accompanying illustration presents a party of women and children on a day's outing in a 1913 model Reo the Fifth, made by the Reo Motor Car Company, Lansing, Mich., and sold through R. M. Owen & Co., 19 West 62nd street, New York City.

The photograph from which this reproduction was made was taken early in June, when the dogwoods, oaks, maples and balsams of this region were at their best, and the party had little trouble in bringing back numerous souvenirs of the trip. It also indicates the possibilities for many a pleasant afternoon ramble through the country or into the woods, over little frequented roads.

LONG BRANCH SHOW.

Month of July to Be Devoted to Display in Ocean Park Casino.

A. D. V. Storey, general manager of the Ocean Park Casino, Long Branch, N. J., announces that an automobile and accessory show will be held in that building June 30-July 1. During the progress of the display it is planned to hold meetings of the Automobile Dealers & Garage Owners' Association of Monmouth county, the Automobile Owners' Association and chauffeurs organizations.

Mr. Storey has had several years' experience as general or publicity manager of trade shows and exhibitions in New York City and elsewhere, and he is confident that the proposed event will prove a success as well as a decidedly novel innovation in the way of an automobile display.

J. D. Fulrath, dealer at Savanna, Ill., for the Buick car, made by the Buick Motor Company, Flint, Mich., recently was told by a lawyer of that city that he would pay him $15 for a rush trip from Savanna to Morrison, Ill., a distance of 38 miles, and also $1 a minute for every minute he arrived before 10. The order was given at 8:30 in the morning and at 8:45 they were on the road. At 9:43 they arrived at the Morrison court house and Mr. Fulrath received $32 for the trip. The route was over hilly roads and the time made is considered a fine record for the Buick car.

Miss Adine Buck of Fort Worth, Tex., won the silver cup in a recent endurance contest of 108 miles. She had previously driven only 20 miles in a car and that on the morning of the race. The machine was a Detroiter, made by the Briggs-Detroiter Company, Detroit.

The National Old Trails Association, Kansas City, Mo., has issued a map and a booklet covering the association's proposed system of national highways. The project has been formulated in a bill introduced in Congress by Representatives Borland of Missouri and Francis of Ohio, calling for a yearly appropriation of $20,000,000.

AN UNFORTUNATE BACKWARD STEP.

In view of the rapid extension of the good roads movement and the increased appropriations being devoted to this purpose in various sections of the country, it is somewhat surprising that the people of Rhode Island should have refused to authorize the bond issue for highway improvement. An analysis of the vote indicates that the cities, which derive no direct benefit from state highways, determined that the country towns should not profit in this manner.

The result is particularly unfortunate when taken in connection with the comment of the British engineers that the Rhode Island roads were the first they had seen which compared favorably with those in Great Britain, since it cannot help but mean that Rhode Island must suffer a relapse in the construction and maintenance of better ways. At the same time it indicates the necessity for a more systematic education of the people to the advantages of good roads.

There has been some suggestion that the voters took this means of entering a protest against the conduct of the state highway department in the past. There is reason for feeling that highway funds might be expended much more advantageously, and Rhode Island may or may not be different from other commonwealths in this respect. Obviously, if there is to be improvement in this regard, the proper remedy lies in eliminating the defects rather than in abandoning the proposition.

THE BRITISH ENGINEERS.

Now that the members of the Institution of Automobile Engineers of Great Britain have come and gone, the American motor car industry cannot help but be impressed with the ability of the men representing the United Kingdom on this trip. Many of them must be regarded as specialists in their particular lines. Each took keen interest in what was presented for their inspection while in this country.

The visit has been of decided value, not alone because American engineers and manufacturers have been able to learn something of the methods employed abroad, but because of the opportunity to become more intimately acquainted with the men who represent the industry in Great Britain.

Elsewhere is presented a somewhat novel statement coming from the chairman of the good roads board of the American Automobile Association, in which that official apparently takes definite issue not only with other interests in the industry, but with many students of economics with respect to the limitation of the weight of vehicles using the highways. The question is not one of the expense involved in the strengthening of bridges, but rather that of impeding progress, since it is recognized generally that the future wealth of the country is dependent in no small measure upon the extension of modern transportation methods. There are other factors involved, chief among which may be mentioned the expense to individual owners in changing vehicles already in use to conform to new regulations, and that of enforcing the proposed new law.

NECESSARY QUALITIES IN LUBRICATING OILS.

(Extract from paper read by Harry Tipper before the midsummer meeting of the Society of Automobile Engineers.)

Lubrication, of course, has for its one general object the conservation of power, or to put it another way, the reduction of frictional waste. The amount of lubricating oil used in the running of any machinery is so small that it has probably been neglected in favor of operations which involve much larger sums in the aggregate. A little study of the losses due to friction which occur in the moving equipment of any plant is sufficient, however, to show the enormous possibilities for the conservation of power and the reduction of waste, which lie in the examination of the conditions affecting lubrication and the quality necessary to meet it.

The efficiency of lubricating oil depends largely upon its ability to maintain a film between the metal surfaces, the extent of fluid friction in the oil film itself as against the friction of metal surfaces, and the amount of oil which is required to maintain the conditions of lowest temperature between the moving surfaces, and as a consequence, the saving of power due to the less absorption of such power in overcoming the friction.

In practical use the oil must vary according to the speed, pressure and heat conditions in the equipment, the amount of moisture, the mechanical arrangements for oiling, together with the question of settlement and filtration. Innumerable modifications may be necessary in the grade of oil required; for instance, the question of dry and wet steam in the cylinders of a steam engine, superheated steam, character of circulating systems, the fit and finish of bearings, etc., all exercise a modifying influence upon the oils which can be used. The accuracy with which the mechanical conditions are determined and the extent to which the manufacturer and his engineering corps are experienced, in the consequent requirements of oils to meet such conditions, are the basis for the successful solution of lubricating problems.

Specifications.

The common method of specifying lubricating oil which has been in use for a great many years is to stipulate a certain gravity, flash, fire, viscosity and cold test, under the assumption, of course, that such limitations of the tests mentioned will have the effect of obliging the manufacturer to submit an oil which will do the work to the best advantage. A thorough examination of these tests, however, shows that they are not by any means conclusive of the value of an oil for lubricating purposes. In regard to some of them, the results are entirely misleading.

The reason, of course, is easily determined. Some 20 years ago when practically all the oil which was in general use for lubricating purposes was drawn from Pennsylvania and adjacent fields, and was composed of practically the same hydrocarbon compounds with the same arrangements and was refined under much the same conditions, it was possible to compare two lubricating oils produced under these conditions by the arbitrary tests mentioned above, which were used by the refiner for his own convenience in measuring the uniformity and character of his runs. But the situation is entirely different. The fields from which the oil was drawn principally in those days supply only a very small percentage of the oil which is used today. The newer fields do not always deliver crude oil of the same characteristics either in a chemical or a physical way, and as a consequence these arbitrary tests no longer answer the purpose, as the different chemical and physical construction of the oils is sufficient to make any comparison on the same basis impossible.

Gravity.

Taking these tests in detail, let us examine the question of gravity in respect of the present day conditions. Gravity is simply the weight of the liquid in terms of weight of water. On the Baume scale, which is the scale in practically universal use in the oil business, the gravity is expressed in arbitrary figures, with the lowest number on the scale representing water and the numbers increasing as the liquid becomes lighter in weight. Gravity was first introduced in lubricating oil specifications because in comparing oils made from the character of crude which was used at the time, it bore a relation to the viscosity or body of the oil. This is not true, however, of some of the other crudes which are now supplying a considerable proportion of the lubricating oil used, as in some of these crudes the viscosity or body may change from 200 seconds to 2000 seconds, while the gravity reading will remain the same. I have lately seen a sample of a crude oil which was heavier than most of the crude oil found and possessed at the same time no viscosity greater than water.

Further, gravity bears no relation to viscosity whatever when comparing lubricating oil made from two different crudes. In one case a 28 to 30 gravity oil may run 180 to 200 viscosity, and in another case the same viscosity may be secured with a reading of 19 on the Baume scale. The gravity reading is practically of no value to anybody but the refiner, who can and must use it in comparing the uniformity of his runs from the same crude. It has been proved through the gasolines, naphthas and burning oils that it has no relation to their value for use, and in the last two or three years the same feature has been thoroughly investigated and proved in respect to lubricating oils.

Flash and Fire.

The flash and fire tests are represented respectively by the temperature at which oil, being heated at a standard rate, with a standard flame, passed over it at a standard distance, will show a flash or flame from the gases arising from its surface, and the point at which the oil under the same conditions begins to burn. From the standpoint of lubrication the only bearing which the flash and fire tests have upon the oil under service is to insure against the presence of volatile constituents which might begin to vaporize at the temperatures reached in ordinary work.

Viscosity.

The viscosity test is represented by the length of time which is required for a specified quantity of the material to pass through a specified orifice at certain temperatures, and the viscosity reading is always expressed as the number of seconds it takes the above-named conditions to be fulfilled. The viscosity of an oil has a considerable bearing upon its value for lubricating purposes, as it determines the speed of flow of the oil under certain temperature conditions, and it is obvious that the rate of flow of the oil is of great importance in considering conditions of pressure and speed in connection with all ordinary lubricating work.

The trouble with the viscosity specification as it is used at present arises from the fact that the viscosity depends upon the temperature at which the oil will work, and if this temperature varies considerably from the standard temperatures at which the tests are usually made, there will necessarily be a great deal of difference in the usual working of the oil under the practical conditions involved. Furthermore, the variations in viscosity of lubricating oils made from different crudes are not the same for different temperature conditions. Finally, the viscosity of lubricating oils made from different crudes does not by any means indicate the fluid friction which is set up internally in the use of the material. In oils made from some crudes the characteristics of the oil change with the viscosity, whereas in oils made from other crudes the viscosity alone can be changed without affecting the other characteristics as shown in tests.

Cold Test.

The cold test is of importance as demonstrating the ability of lubricating oil to remain fluid under conditions of exposure to low temperatures. Its value, however, depends entirely upon the work to which the oil is to be put. The cold test is sometimes made by reducing the temperature of the oil and taking the point at which it becomes cloudy; again by reducing the temperature and taking the point at which it refuses to pour out of a standard orifice in a standard quantity. The cold test is a question of the ability of the lubricating oil to meet the practical requirements of the working conditions, and it is evident, therefore, that an oil which will flow at a point in temperature as nearly as possible the minimum temperature experienced in actual conditions of use will be most valuable for the purpose.

The point, however, which should be noted in connection with all these tests on specification for oils is that they do not demonstrate the value of the oil under practical conditions, and merely put a limit upon the competition which can be secured or upon the amount of oil which can be drawn from for use, without in any way furthering the value or advantage. To put this matter

Digitized by Google

concretely, engine oils manufactured from different crudes show the following variations in the characteristics:

Gravity	19° to 31°
Flash	320° to 400°
Fire	370° to 450°
Cold	0° to 30°
Viscosity (on Saybolt instrument)	120° to 750°

Or higher at 100° Fahrenheit.

Within this range of characteristics oil suitable for all classes of engines can be picked out, and the question of their suitability would not depend upon the particular tests displayed by the oil. Two oils answering the same laboratory tests might show entirely different results in actual work, due to difference in the methods of manufacture not appreciable in a laboratory inspection; one would lubricate and the other would not.

Requirements.

Inasmuch as the arbitrary tests to determine the physical characteristics of the oil do not illuminate its value for any particular purpose, let us consider what the oil should do. In order to bring this directly to the point of greatest interest to the society, that is, the lubrication of the motor of automobiles, let me suggest the requirements which a lubricant for this purpose should meet:

1. The oil should posses a sufficient body to keep the bearing surfaces apart at the temperature at which the bearings run.
2. It should possess such qualities as will reduce the friction to a minimum.
3. The flash point should be sufficiently high to insure against the presence of volatile constituents.
4. It should remain fluid at such low temperatures as will be met in service conditions.
5. It should have no tendency to decompose or to form such deposits as will gum up the machine and increase the friction, where the object is to decrease it.
6. It should contain no ingredients which will corrode or pit the metal.

In considering the qualifications to be added to these general requirements in order to define application to the mechanical conditions of cylinder lubrication, it is necessary to consider the questions involved in the operation of an internal combustion engine, which are different from those of any other type. What I have to say now may appear very elementary from a mechanical standpoint, but unless it is mentioned, the important bearing which it has upon lubrication will not be as obvious as I want to make it.

After a charge has been taken into the cylinder on the suction stroke it is compressed to from 50 to 75 pounds before being fired. Naturally upon the starting of the compression stroke there is a tendency for the gasoline mixture to leak. There are two ways of obviating this difficulty, of securing full compression. These two ways might be stated as mechanically secured compression, formed by the close fit between the piston or piston rings and the cylinder wall; or compression secured by liquid seal, which means the use of an easy clearance between the piston rings and the cylinder wall and the sealing of the space between them by the use of a proper kind of lubricating oil. In respect to the mechanically secured compression the following points are worth noting as axioms which must be taken into consideration in estimating the conditions:

1. The closer the fit, that is, the less the clearance between the piston and cylinder walls, the more the power absorbed in turning the engine over. In fact, it is possible to secure perfect compression in this way only by securing so tight a fit that the mechanism will not turn. Even in practise good compression can be secured only at the sacrifice of some of the effective power.
2. The closer the mechanical fit between piston and cylinder walls the thinner a lubricating oil which will work its way between them. The thinner the lubricating oil the greater will be the wear and tear, because of the impossibility of keeping the metal surfaces apart where the clearances are so small and the lubricant must be such a slight film.

With these conditions, when wear and tear has once begun, every stroke of the engine increases the loss of compression, the consumption of lubricating oil, the consumption of gasoline, in proportion to the amount of power, and, in fact, decreases continually the efficiency of the motor. You will readily see the impossibility of securing and maintaining maximum efficiency under the conditions.

The motor after leaving the factory is run at great variations of speed and considerable variation of load. These variations are quite rapid and frequent. On account of the mechanical conditions of the motor you have recommended a very thin, light lubricating oil for the motor, under the guarantee. This lubricating oil has no particular adhesiveness and will flow as readily from the cylinder wall as to it. Consequently, during the rapid and frequent variations of speed, cylinder walls are sometimes overburdened with oil and sometimes practically dry, making wear and tear excessive and naturally resulting in a very rapid increase in the space between the piston and cylinder wall. This wear and tear is not thoroughly even; the clearance is larger in some places than in others. Then the lubricating oil flows freely up and down the walls of the cylinder and there is never any time when just the proper amount of oil is on the cylinder wall. The oil is so thin that it cannot be held in the increased space, consequently on the compression stroke the gasoline mixture escapes past the piston, destroying the lubricating oil in the crankcase, and reducing from 15 to 30 per cent. the power which should be secured from the gasoline.

You have seen from time to time in your experience with races, racing motors, etc., that after a three or four hours' run the oil in the crankcase has had to be dumped because it was so light in body as to be like water. I have heard some drivers, and also some engineers, thoroughly well acquainted with the motor, try to explain this fact by saying that the oil decomposed. Such a thing is, however, unknown in the oil business. In all other cases of the use of petroleum oils for lubricating, length of use only makes the oil a little heavier and a little darker in color. In no case has it ever been found possible to use an oil for lubricating purposes and secure a lighter product. This can be done by admixture only.

Carbonization.

Further, the condition under discussion is responsible largely for the carbon which is so constantly being experienced on account of the fact that the oil, being very light in body and free-flowing, is drawn up during the suction stroke into the compression chamber and onto the piston head, where it is distilled, leaving a coke baked on the piston head to the first ring, upon the valves, etc.

Consider, instead of the mechanically secured compression used in connection with thin oil, compression which depends upon the use of lubricating oil, the clearances being larger. From the standpoint of the mechanical efficiency of any power generator, and, in fact, any moving equipment, the best fit—that is, the mechanical fit which absorbs the least amount of power due to friction in the power generator itself—is an easy sliding fit. If dependence is to be laid, however, upon the metal and not upon the lubricating oil to maintain compression, this easy sliding fit is too loose to give the compression required. If, however, it is intended to secure the compression by the liquid seal of the lubricant, then an easy sliding fit can be given to the motor, a sufficiently heavy-bodied oil used for lubricating with the result that the metal surfaces can be kept apart, the compression can be maintained so that there will be practically no change in the lubricating oil in the crankcase and only the ordinary wear and tear on a properly lubricated surface will take place, which wear and tear is infinitely slower than the wear and tear which usually occurs under the conditions previously mentioned.

In working out lubricating oils for automobile engines we are using today oil of 200, 300, 500 and 750 viscosity; the oil of 200 seconds viscosity being used entirely for those motors which are being made with clearances too small to permit of the oil of the proper body being used. Thousands of tests by private owners, which, while they may not be accurate, indicate the general result that in practise by the use of these heavier oils they have secured from 10 per cent. to 20 per cent. and in some cases over 30 per cent. more power from the fuel, owing to the saving of any loss on the compression stroke. On this account they have also used less lubricating oil, due to the fact that there is no admixture of gasoline, deterioration consequently being very slow. There is also less wear and tear on the cylinders and practically no trouble from carbon.

INFLUENCE OF SALES DEPARTMENT UPON DESIGN.

(Extract from paper read by F. E. Moskovics before the midsummer meeting of the Society of Automobile Engineers.)

A few years ago the design of motor cars was practically dictated by the sales department, the engineering department being merely a way station to put the views of the sales department into such technical form as would enable the factory to manufacture a car therefrom. This was due chiefly to the embryonic condition of the industry and also to the fact that substantially all the real executives and heads of factories were themselves salesmen, as well as to the fact that there was no intelligent public demand. The motor car was new; the man in the street did not know what he wanted; horsepower varied from four to 120; gearboxes from belt to direct drive. Technical knowledge was as yet unmated with experience—so, naturally, the views and influence of the sales department were dominant and supreme.

Then, a few cars appeared, which due to their great mechanical advances, made a profound impression on the public. The design of these cars was actuated solely and purely by experience; the result was Renault, with light weight and shaft drive; Mercedes, with selective transmission, mechanical valves, cellular radiator, etc. Coincident with the arrival of these cars appeared the awakening of public demand, and, whereas the early engineer taught the public what it ought to have, today the public is surely telling the engineer and manufacturer what it wishes to have, in no silent voice.

About this time the influence of the sales department in the matter of design began to wane a little, in a large degree from the fact that any car on four wheels would sell. It was not so much a matter of which car was best, as what car could be delivered. Now, if we can assume that the day has passed when a customer considers himself fortunate if he can obtain an early delivery; if we take for granted the absolute necessity for stronger basic work (sound financing, good engineering, efficient production and economic and effective selling); if we can thoroughly grasp the why and wherefore of interdepartment economies, and the need of inter-departmental co-operation, and, with these things in mind, grant the advantages that may be attained, we can approach the subject of this paper from a more intelligent angle.

Co-Operation.

In many organizations the sales department wears a halo unwarranted by facts and bad in principle. This is due to many causes, the main one being that it actually brings in the dollars; it is apparently the department that creates the much sought dividends. Besides it is the department that comes into contact and mixes with the outside world to the greatest extent. It is, or should be, better fitted to tell of its own importance and greatness than any other arm of the business; its business is the art of selling, and it can, or should be able to, sell itself as well as it praises and sells the product at its disposal. In other words, the sales department is the mouthpiece of the organization, the real point of contact between that final judge, the ultimate consumer, and the factory. Naturally, this condition ofttimes becomes galling, especially to one so little given to the study of environment as the average motor car engineer. The result is lack of regard for the ideas, views and opinions of one department for the other. Of course, no lasting benefit can come from such a relationship. Each department has its functions; each is all-important to the success of the other. Healthy and deep respect for each other's views in everything that pertains to the welfare of the organization as a whole is requisite to permanent success.

In the past the average sales department has had little real knowledge of the art of motor car building what it gleaned was of a purely superficial and perfunctory character, usually limited to parrot-like repetition of a few technical platitudes called for want of a better name "talking points." No systematic attempt was made to thoroughly ground the salesman in the rudiments of the profession, nor did he, for lack of initiative and time, obtain the information on his own account. How few salesmen of even today have a real general knowledge of the basic facts of the business! They have been, and to some extent are still chosen for their appearance, glibness of tongue, and personality, rather than with due regard to the adaptability to learn, digest and transmit knowledge in a clean-cut manner.

The day is, however, rapidly approaching, if indeed it is not already upon us, when motor cars must be sold and not bought. The buying public become car-wise and knowing what it wants has little respect for or patience with the man who cannot explain in a clear, concise and logical manner the different points of a car that may come up for discussion. The man buying his second or third car has well defined ideas of his own, and cannot be talked into an unwise investment, nor influenced by mere talking points. The points must be real points, and be well presented. The public craves information in a rational form. The time has passed when anything less will do. This is a day of facts, not fancies. The merely magnetic talker has seen his day.

A Proposed Solution.

Could the engineer have at his disposal the concrete views of a trained body of men; could these views be presented to him in time to reasonably allow him to get up new designs; could he be placed automatically in closer contact with the user of his car, is it not evident at a glance that enormous benefits and economies would result? It is clear that the economies so necessary to success in the industry today will not allow an organization to have a specially trained corps of men for this work.

Where then should the engineering department get its closer contact with the public? Analysis points plainly to the fact that it is through the sales department. Moreover, the bringing of these departments into closer working relation should serve to raise the sales department to a higher standard of knowledge of its own products as well as of those of its competitors, thus enabling it to become more efficient in its own field and more capable of placing intelligently before the engineering department its views of future necessities of design, including comparison of the products of the particular organization and of competitors in actual service. In addition the sales department should grasp more understandingly the large problems of the production department, deterring it from making suggestions which on their face are out of accord with the policies or possibilities of the organization.

Summed up the problem has two aspects: First, in the majority of instances there are entirely insufficient points of contact between the sales department and the engineering department; second, there are insufficient points of contact between the engineering department and the ultimate user of its product.

How, then, to cure these apparent defects? Surely, an annual meeting where all the salesmen are brought together in a joy feast is not the place; the chief engineer, let us say, addresses the body; as a whole, the members are known to be gathered merely for the purpose of mutual admiration. The average house organ is not the medium, because truths are not told there; the house organ is usually a means of self-praise rather than self-analysis.

In this paper no consideration is given to the chief executive or the general manager as a factor for the reason that its object is to suggest an automatic means of communication of thoughts and ideas between the two arms of the business, and naturally the supposed superior knowledge of the head of the organization will be superimposed on the hoped-for result of the closer union of these two departments. As there appears to be at present no definite channel through which the two departments can come more closely together, the writer suggests:

First—A weekly engineering bulletin, edited by the chief engineer, taking up in groups the different parts of the vehicle, preferably employing the same nomenclature the factory has given to the various parts; appending the part or piece numbers in question (this will familiarize the salesman with part numbers).

Pains should be taken that the bulletin be free from abstruse technical terms and data which might not be easily digested. Care should be taken to inquire whether the salesmen can read simple blueprints; if so, diagrams explaining the theory of the various points should be furnished. The salesman would thus obtain a direct knowledge of the product which he could gain in no other way. In each bulletin a personal appeal should be made to the salesman that he request any information on any point

Digitized by Google

that he does not understand thoroughly, and a further explanation should be cheerfully and gladly given to him. The chief of his department should constantly urge him to correspond directly with the chief engineer on these points, and it should be strongly impressed on his mind that it is no disgrace to come back and say that he does not understand the topic discussed in a certain bulletin. In fact, the writer should urge that upon publication of the bulletin it become mandatory on the part of the salesman to express weekly his view on the topic described.

Is it not patent that a sales organization understanding thoroughly the car in the manner which the bulletin indicated would bring about, would be of great assistance to the engineering department, and that its value to the general organization would be increased enormously not only by reason of the efficiency of the salesmen, but because of its role as the eye of the organization?

Would not the engineer, when the time came to consider the views of the sales department, feel greater confidence in the ideas and opinions of an organization which he had reason to believe had at least a thorough knowledge of his product, than under the existing conditions? Few companies are so strongly entrenched that they can disregard arbitrarily the demands of such a sales department. Certain firms assume the attitude that a given mechanical theory is correct simply because they have adopted it, but even they, if they are far-seeing, know the day is coming when a just retribution may overtake them.

The sales department should have a voice and influence in the design of the car, but must first be so schooled and trained that it will harmonize with the organization rather than be a discordant note.

With regard to my second suggestion, contact between the engineer and the owner, the problem is somewhat more simple. The appended form could be sent to every agent and distributor of the factory, with positive instructions that it must be filled out every 60 days. This would give the engineer first hand information as to exactly how the product is being received. It would enable him to eliminate apparent defects due to local conditions. Let us assume that from the replies it becomes evident that there is considerable noise in the shifting of gears. It is not supposed that the average agent will be able to analyze the clutch problem, that he can tell whether the clutch is too heavy or the gear ratios incorrect. That, of course, remains for the engineer to diagnose. But the replies will place in your hands, without delay, troubles resultant upon design or manufacturing defects. Again, let us assume that the gasoline and oil consumption are very high, much higher than you know should be the case; the service department will instantly get into communication with the dealer and help him to alleviate the condition.

Of course, the theories advanced here, like all theories, are useless, if not used. The object of this article is to point out a means whereby the influence of the sales department on the engineering department can be brought to a stage of intelligent co-operation.

FORM.

For the Confidential Use of the Engineering Department.

It is highly important for your own benefit as well as ours that you give us the following information as accurately as possible. It is our endeavor to make our cars meet the severest general requirements and only by a definite, direct and accurate knowledge of how they act under widely varying conditions can we hope to accomplish this. Please be guided accordingly.

Date:
Agent's name:
Territory covered:
How many of our cars are in operation in your territory?
What is mean altitude of territory covered by you?
What is general topography of territory covered by you? Mountainous, hilly, level.
Are road conditions good?
If not, please briefly state conditions and about what proportion of roads are macadamized, etc.
What is maximum average temperature?
What is minimum average temperature?
1. Does our line have power enough for your customers. If not, what would you suggest?
2. Is our motor quiet enough for your clientele?
3. Is our line flexible enough?
4. Do our motors accelerate rapidly enough?
5. How do we compare with competitors in our class? Please state which competitors, if any, surpass us?
6. Is the fuel consumption (both oil and gasoline) satisfactory? Please state your experience generally.
7. Are our gears quiet enough for your clients? If not, please state which are noisy.
8. Is the clutch action satisfactory, both as to engagement and holding?
9. Does our spring suspension meet with general approval?
10. Is our steering gear meeting all requirements?
11. Are our gear ratios correct for your territory?
12. Have you heard any criticism of our upholstery, either in material or workmanship?
13. Have you heard any complaint on the accessories we use? If so, please particularize.
14. Have you had any trouble reported on the bearings we use?
15. Is our rear axle construction meeting the requirements of your trade?
16. Please state any general criticism on appearance or general design you may have encountered.

This information is so important to us that we urge it be made out under the direct supervision and be signed by the head of your organization. It will materially help us build better cars.

INNER TUBE BAGS.

Chas. E. Miller Calls Attention to Desirability of Their Use.

"After all, it is the attention to little details that counts in touring," says Chas. E. Miller, the New York City automobile supply dealer. "Notwithstanding the use of the demountable rim and the carrying of already inflated complete tires on these rims, it is still necessary to carry extra inner tubes, and the old idea of tying them up with a string and throwing them in loosely with a lot of tools and oil cans in a tool box no longer prevails.

"And why should it, when, for a nominal charge one can secure a real inner tube bag made of heavy napped cloth and mailed free to any part of the United States? Such a bag will keep the tubes free from grit and dirt and from scratching and chafing while in the tool tox or luggage carrier. The bag will hold a five-inch tube or smaller, but in ordering it is just as well to get the right size."

The Joseph Dixon Crucible Company. Jersey City, N. J., has published a booklet entitled "Graphite for the Boiler." This booklet deals with no new discovery, for graphite has been used to remove scale from boilers and collections in motors, etc. No startling claims are set forth, but a simple statement relative to the product and its use is made. The Joseph Dixon Crucible Company is the oldest and largest maker of graphite and graphite products in the world and it guarantees all of its various manufactures.

ITINERARY IS DECIDED UPON.

Indiana Automobile Manufacturers' Association Pick Route to Coast.

The tour committee of the Indiana Automobile Manufacturers' Association has announced the itinerary for the transcontinental tour of that association, which is scheduled to start from Indianapolis, July 1. The route was compiled by the following: W. McK. White, tour chairman; W. D. Edenburn, assistant chairman, and J. M. Ward, Jr., secretary of the association. It will visit eight states and take the tourists through a section of the country which has shown enormous interest in the event. The itinerary follows:

Indianapolis to	Miles*
July 1, Terre Haute, Ind.	70.4
July 2, Springfield, Ill.	149.5
July 3, St. Louis, Mo.	116.7
July 4, Columbia, Mo.	140.7

Map Indicating Itinerary Selected for Transcontinental Tour of Indiana Automobile Manufacturers' Association.

July 5, Kansas City, Mo.	159.2
July 6, in Kansas City.	
July 7, Fort Riley, Kan.	156.6
July 8, Ellis, Kan.	177.9
July 9, Burlington, Kan.	169.8
July 10, Colorado Springs, Col.	166.7
July 11, Denver, Col.	69.2
July 12, in Denver.	
July 13, Hot Springs, Col.	89.8
July 14, Glenwood Springs, Col.	104.2
July 15, Grand Junction, Col.	104.5
July 16, Woodside, Utah	172.0
July 17, Salt Lake City, Utah	175.0
July 18, in Salt Lake City.	
July 19, side trip to Ogden, Utah	74.4
July 20, Kearney's Ranch, Utah	146.8
July 21, Ely, Nev.	124.3
July 22, Tonopah, Nev.	147.3
July 23, Bishop, Cal.	....
July 24, Reno, Nev.	179.0
July 25, Sacramento, Cal.	165.8
July 26, Oakland, Cal.	130.7
July 27, ferry to San Francisco, Cal.	6.0
July 28 and 29, in San Francisco.	
July 30, De Monte, Cal.	141.0
July 31, San Luis Obispo, Cal.	149.9
Aug. 1, Santa Barbara, Cal.	119.6
Aug. 2, Los Angeles, Cal.	105.8

*Mileages are approximate.

14	Pathfinder	Motor Car Mfg. Co.
*15	Premier	G & J Tire Co.
16	McFarlan	McFarlan Motor Car Co.

*Truck.

The head of the shipping department of the Canadian factory of the Ford Motor Company, Ford City, Ont., maker of Ford cars, has troubles occasionally in locating towns for shipment of cars, because they are not upon the maps, nor in the postal guides. This is because of the suddenness with which towns spring up over night in the Canadian Northwest and the only way in which the difficulty is overcome is by having the postoffice department locate the places.

The non-stop reliability automobile run from Chicago to Boston, scheduled to start June 25, was postponed at a meeting of the contest committee of the Chicago Automobile Club. Assurances that the A. A. A. is preparing to formulate stock car rules caused the club officials to let the run go over until October.

There is much agitation in Detroit as to the advisability of inaugurating a strictly dealers' show in the summer. This will probably be held something on the order of the furniture dealers' show given annually at Grand Rapids, Mich.

IN THE COMMERCIAL VEHICLE FIELD.

Constructional Features of Christie Front-Drive Tractor Adopted by Fire Department in Pawtucket, R. I.—Description of New Willet Two-Ton Wagon.

FOLLOWING its announced plan to eliminate horses in the fire department as rapidly as possible, Pawtucket, R. I., has installed a 90 horsepower Christie front-drive tractor on the hook and ladder truck located at the central station. The tractor is the same in design as those which have been placed with the departments in New York City, Pittsburg and other cities, but is understood to be the first to be located in New England.

It will be remembered that Walter Christie has been an earnest exponent of the front-drive principle for a number of years, having built and driven racing machines of this type in several well known contests. Recently, Barney Oldfield, at the wheel of one of the Christie front-drive cars, covered a mile on the new Bakersfield mile dirt track in California in 0:46.5. Pending the receipt of further information concerning the timing device used, the contest board of the American Automobile Association has declined to accept the mark, but on the face of the returns it is a new world's record.

Christie Front-Drive Tractor Installed with Pawtucket's Hook and Ladder Truck.

The Christie tractor is made by the Front-Drive Motor Company, Hoboken, N. J., and does not resemble the racing machines in construction. The two disc wheels are supported by a heavy dead axle on which they revolve. Above this is the live or counter axle, which is in reality a jackshaft. This jackshaft is fitted with a heavy spur gear differential and with universal joints at either end which have a wide radius of movement. The pinions mesh with internal gears contained within the wheel housings, and power is transmitted through a gearset of the progressive type giving two speeds forward and reverse, and by chain from the transmission shaft to the jackshaft, there being no change whatever in the relation of the engine shaft and jackshaft. The power plant is located well forward of the axle, and is mounted transversely of the frame.

The universal joints in the jackshaft and the knuckles and wheel pivots of the dead axle permit of a 30-degree movement of the wheels by means of the steering wheel, this being the usual allowance for turning. There is a turntable on which the tractor is swung by a worm gear driven direct from the transmission gearset case, this being operated by a movement of the same lever that changes the speed ratios, and by this the turntable may be moved 60 degrees more. This is made with a frame that is rigidly bolted to the forward end of the truck, giving a slightly longer wheelbase than when it was utilized with horses, this now being practically 26 feet. Of course the rear wheels are steered by tiller as with the ordinary vehicle of this type, and the driver must govern his turning not only to accommodate the long wheelbase, but some 12 feet of overhang on the ladders. Pawtucket is one of those old time New England cities in which there are sufficient

Digitized by Google

crooked streets to make necessary a large number of sharp turns in answering almost any alarm. Thus far the driver of the new truck says he has

KisselKar Combination at Work at Street Sprinkler.

experienced no more trouble than with the horse drawn vehicle.

NEW STREET CLEANING MACHINE.

Combined Flusher and Sprinkler Produced by Kissel Motor Car Company.

Accompanying illustrations present the new patent combination uniform pressure street flusher and sprinkler recently placed in the market by the Kissel Motor Car Company, Hartford, Wis., maker of KisselKar pleasure and commercial vehicles. The design is such that it is expected to afford a satisfactory means for cleansing city pavements. The flushing and sprinkling mechanism is operated by hand levers under the driver's control, and so arranged that it can be changed from one to the other in an instant.

The chassis is that of a regulation KisselKar three-ton truck, fitted with a 1000-gallon galvanized steel tank. Pressure is produced by taking the water by gravity from the bottom of the tank into a two-stage centrifugal pump directly connected to the motor, and it is maintained that this may be from 20 to 60 pounds, according to the speed of the engine. The water is then forced into distributing pipes and out through adjustable nozzles for flushing and through two pipes to sprinkling attachments of the vehicle type. It is claimed that the same pressure can be maintained when the tank is partially full as when entirely filled, making it possible to secure the benefit of all the water contained in the tank.

The sprinklers are so arranged that they will sprinkle the full width of a 60-foot street from curb to curb, or they can be closed down to accommodate 20, 30, 40 or 50-foot streets at will. They will sprinkle both sides at once or either side separately, making it possible to operate the machine successfully where the traffic is heavy. One tank of water will sprinkle seven to eight blocks of 50-foot roadway, or will flush a distance of 3.5 blocks.

WHITE IN LUMBER HAULAGE.

Unusual Service Rendered by Five-Ton Vehicle in the Ohio Woods.

An interesting example of efficiency in the use of a motor vehicle under unusual conditions is to be found in the service of a five-ton White truck, made by the White Company, Cleveland, O., with Theodor Kundtz, who conducts a lumbering business in the woods in the southern part of Cuyahoga county, that state, near the Breckville station. The work differs somewhat from ordinary lumbering, as it is his policy to select only the trees that will yield the class of timber desired and haul the logs to the railroad station.

The engineering department of the White Company assisted Mr. Kundtz in solving the problem, after obtaining from him detailed information as to what was desired. The five-ton chassis was utilized, but instead of the regular four-cylinder motor a six was employed. Special axles were built as well as special wheels, both front and rear. The front members were of the standard White cast steel construction, but

Indicating Value of KisselKar Flushing Apparatus.

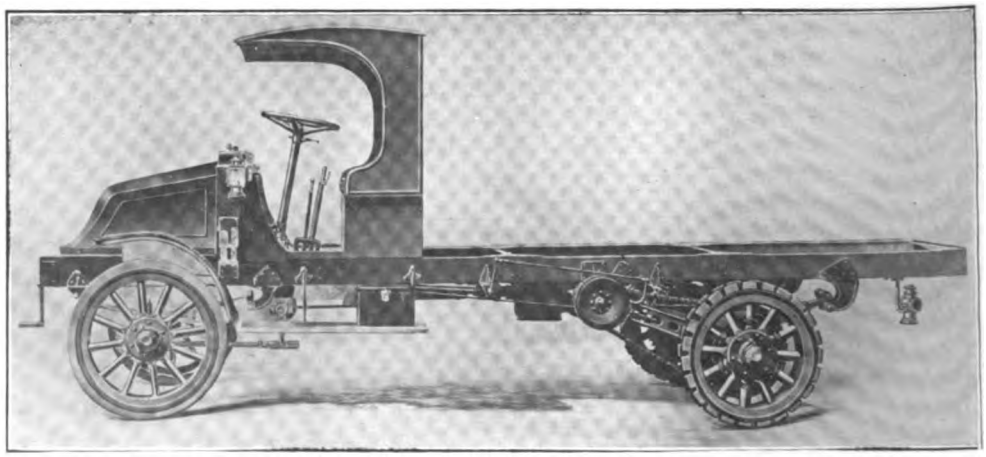
Digitized by Google

White Five-Ton Truck with Special Equipment Engaged in Lumber Haulage in Ohio Woods.

fitted with steel tires having a centre flange to prevent side slip. The rear wheels were the regulation tractor type with 22-inch steel rims and round steel spokes mounted at either side of the hub. In the centre of the outer surface was fitted a ring of steel and from this at an angle of perhaps 20 degrees flat cleats extended to the edge of the rim, stiffening the construction and insuring traction on any surface.

The truck is fitted with a power winch that is driven off the transmission gearset shaft, this being installed transversely and operated with a hand lever. With this winch it has been found possible to load 1000 feet of timber in 20 minutes. It will be understood that many times it is impossible to drive the truck directly to the point where the tree has been felled, and the winch also is employed to bring the logs to the vehicle.

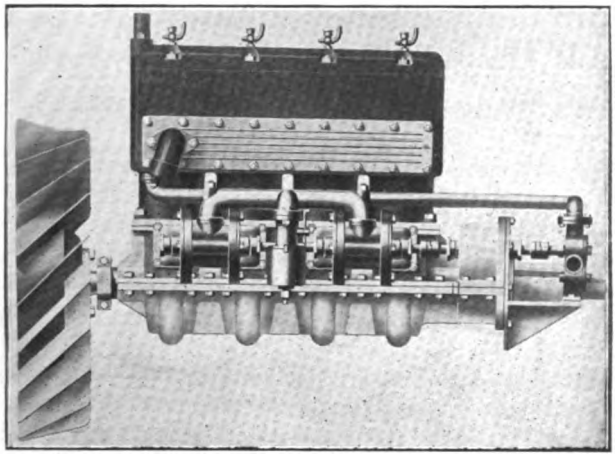
Hauling from five to six tons at a load the truck makes trips between the forest and the Breckville station, a distance of about six miles. Upon arrival at the station it is possible either to pile the logs beside the track or load them directly upon the cars. After a year's service in all conditions of weather and surface the machine has been found equal to expectations in every way.



WILLET TWO-TON MODEL.

New Design of Delivery Wagon Utilizing Motor of Two-Cycle Type.

Announcement is made by the Willet Engine & Truck Company, Buffalo, N. Y., of a new two-ton chassis, which is the first of a series of sizes it is to produce. A feature of the construction is the use of a two-cycle motor which is novel in design and which has been patented and is the exclusive property of this concern.



This motor differs from conventional two-cycle engines in that rotary intake valves are employed, it being maintained that these are self-grinding and self-adjusting, thereby requiring practically no attention. The cylinders are cast en bloc, with the head of the block cast separate, this being cored for a liberal water space. The head of the water jacket is a plate that is slightly crowned and it is retained by a series of cap screws. There is a single outlet at the extreme rear of the block. The engine base is in three sections, the upper and lower halves and an extension that covers the forward end of the crankshaft and forms a cover for the timing gears. In the upper section are large plates covering handholes through which the main and crankpin bearings may be examined or adjusted. The lower section is formed to have four transverse channels or pits into which the big ends of the connecting rods swing and which take the drainage of lubricant from the interior of the engine case.

The bore is 4.5 inches and the stroke five, giving a rating of 32.4 horsepower under the S. A. E.

Chassis of Willet Two-Ton Delivery Wagon, Indicating Design and Arrangement of Components.

Digitized by Google

Right Side of Willet Engine, Showing Mechanism of Rotary Valves.

formula for a four-cycle engine, and if the usual 50 per cent. is added to this it will be seen that the maker's rating of 32 horsepower is very conservative. Lubrication is by feeding the oil in the fuel in the proportions of one pint to five gallons of gasoline. The carburetor has a fixed adjustment. Ignition is by an Eisemann high-tension magneto. The radiator is of the flat tube type, mounted on springs on the main frame in front of the dash, following the so-called foreign design.

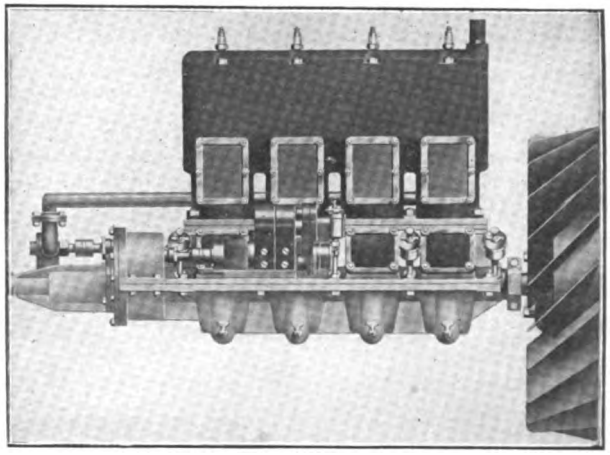
The clutch is a leather faced cone with a series of flat springs beneath the facing to insure ease in engagement. The transmission is of the selective type, assembled as a unit with the jackshaft, and has three forward speeds and reverse. The drive from the jackshaft is by side chains. Springs are semi-elliptic all around. The service brake is on the jackshaft and the emergency on the rear wheel drums. Wheels are of wood, artillery type, these being shod with 36 by four-inch single tires in front and 36 by 3.5 dual in the rear. The driver is located at the left with the control levers in the centre. The wheelbase is 144 inches, regular, or 168, special.

BUICK WINS ABROAD.

American Machine Finishes in First Place in Two Important Events.

Word recently reached this country that two model 25 Buick cars, made by the Buick Motor Company, Flint, Mich., finished in first and second place in the annual Oranias circuit race in Oran, Algeria. The entries included five cars of French make, two Belgian and two other American. The winning Buick made an average speed of 61 kilometers, equivalent to 31 miles an hour.

It also is announced that a Buick, entered in competition with several machines of foreign make, won in a recent contest at La Sarthe, France, finishing at an average speed of 65 miles an hour.



NOVEL BRIDGE CONSTRUCTION.

New Mexico Provides Road That Cannot Be Used for Horse Drawn Vehicles.

Between the towns of Roswell and Vaughn, New Mexico, there is an automobile road with bridges of unique design. The road runs through stretches of almost impassable sand and despite the fee of five cents a mile it is very popular with motorists. The peculiar feature of the route lies in the bridges, which can be used only for automobiles.

These consist of two wooden troughs placed 56 inches apart, and as they are not connected with cross boards, the middle of the bridge is open for its entire length and horse drawn vehicles cannot pass over. Each trough has protecting sideboards, so that the cars cannot leave the track and slide into the ravine. It is a popular road for motorists when touring the southwest.

The Chicago Motor Club is preparing to erect at a cost of $500,000 a new seven-story structure, containing both hotel and club facilities. The plans provide for a hotel of about 250 apartments, a thoroughly equipped club house and a garage capable of holding at least 150 machines. Members of the club will be given special rates in the hotel, although the renting of rooms will not be restricted exclusively to the club membership.

MOTORING LAWS AND THEIR ENFORCEMENT.

Mississippi Supreme Court Declares Statute Is Unconstitutional—Automobile Legal Association Takes Stand Against Reckless Driving—Other Legislative News.

UNDOUBTEDLY one of the most important decisions with reference to the motoring laws of any state is that handed down recently by the supreme court of Mississippi. This action was brought against H. C. Lawrence of Jackson soon after the Mississippi law became effective, June 1, 1912, and was largely in the nature of a test case. The local courts held in favor of the statute, but the highest court of the state takes the opposite view, declaring the law unconstitutional, void and of no effect. In his opinion, Chief Justice Smith stated:

While there is no doubt of the police power of the legislature and of its authority to pass suitable laws governing the operation, the numbering and registration of the machines, it is apparent that the registration fee is excessive and out of proportion to the actual cost of operation of the law. It develops, on inquiry, that the actual cost of numbering and registering these cars, issuing licenses and other routine work connected with the enforcement of the act, is not over $1 a car. The license fee is graduated from $5 to $25, where $5 might seem a reasonable registration fee on a straight basis.

As a result of the decision the state auditor is required to return to automobile owners some $28,115 which has been collected in registration fees since the law went into effect. But here arises another difficulty, since the constitution provides that the state auditor shall pay out no money except upon authorization of the legislature. The legislature provided for the collection of the fees, but of course, made no provision for their return.

TO HELP ENFORCE LAWS.

Automobile Legal Association Takes Determined Stand on Reckless Driving.

The Automobile Legal Association, with headquarters in Boston, has taken a determined stand in the matter of reckless driving, having employed a corps of motorcycle riders who will secure evidence against violators of this provision of the motoring laws in particular. These patrols will operate in Massachusetts, southern New Hampshire and Rhode Island for the present.

The plan is based upon that which has proven effective in Great Britain, under the auspices of the Motor Union, and in some countries of Europe. Not only will the patrols secure evidence of real reckless driving, but similar attention will be paid to the matter of lights on all vehicles using the roads at night, where such laws are in force.

ROADS AND BRIDGES.

Official of Automobile Association Surprises Motor Truck Interests.

George C. Diehl, chairman of the American Automobile Association's good roads board, makes the suggestion that a meeting of the leading state highway commissioners and the manufacturers of horse drawn wagons and motor driven trucks be held for the purpose of an interchange of views and the drafting of suitable legislation governing the width of tires and weight of loads. Mr. Diehl states his position as follows:

Many states have enacted laws which endeavor to regulate the width of tires of vehicles, but unfortunately there has not been strict enforcement of these regulations. The width of tires is one of the important factors in highway construction and maintenance. Narrow tires, especially during the wet season, form ruts in improved roads and in many instances, where the roads are weak, break through the surface, with the subsequent rapid destruction of the highway.

One great difficulty in enforcing wide tire ordinances with horse drawn vehicles has been that while less traction is required with wide tires, on slippery clay or hill roads it is very difficult in wet weather to manage a horse drawn vehicle with wide tires, owing to its tendency to skid and slide onto the ditches. Instances are frequent where in a journey a farmer must drive over miles of slippery road and only have a few miles of improved highway, in which case he would naturally prefer to use narrow tires for the entire distance.

There is no question that protection and economical maintenance of improved highways require that narrow tires should be discarded, and ordinances must be enforced which will prevent their use on main travelled highways which have been improved at great expense. If a vehicle owner desires to use narrow tire wagons on slippery roads, he must be absolutely prevented from using the same tires on improved roads. Equal, if not greater, damage can be done to the highway with tires of insufficient width on motor trucks. There is no state where wide tire ordinances are drawn which relate to both horse drawn and motor driven vehicles, or where a scientific attempt has been made to prepare such ordinances, or where a strict enforcement is had.

It also is entirely practicable and reasonable that the weight of loads should be limited, as the bridges which form an integral part of the highway are not, in a great majority of cases, sufficiently strong to carry weights which are becoming more and more excessive. It must be recognized that it is impossible, within any reasonable time, to reconstruct thousands of bridges. There should be legislation in all the states limiting the weight of loads and prescribing the width of tires, and specifying an adequate and reasonable method of strictly enforcing such regulations. As far as possible, the laws in the various states should be uniform, with a view that the manufacturers of wagons and motor trucks may be guided in their construction of vehicles.

Digitized by Google

Another traffic factor which should be the subject of uniform legislation or regulation, is the carrying of lights on vehicles at night. Nearly all automobile laws require front and rear lights on motor driven vehicles. In some of the more populous sections, such as New York and Connecticut, many drivers of horses use lights, without the legal requirement, as a matter of self-protection. That all do not do so emphasizes the need for laws on the subject. With the travel on the roads constantly increasing, there is no reason why lives and property should be endangered by absence of lights on any class of vehicles.

Mr. Diehl's position with regard to the limitation of weights to be carried comes as a decided surprise in view of the stand taken by the National Association of Automobile Manufacturers and a large number of organizations of motor truck owners and users. It would appear from this statement that the American Automobile Association was not in accord with other interests of the industry in this respect.

WANTS NEW REGULATIONS.

Commissioners of District of Columbia Ask Congress for More Power.

A bill conferring upon the commissioners of the District of Columbia general and complete authority to regulate motor vehicle traffic in that district has been filed in Congress. It is contended that better results can be obtained where the commissioners are enabled to enact new regulations, than when the matter of controlling the subject is dependent upon the action of Congress.

The bill provides for the repeal of the present motoring law in the district and for the following: Annual registration instead of the present single registration without time limit; abolishing the special wheel tax imposed upon automobiles and giving the commissioners discretion in the making of regulations governing the speed at which motor cars shall be driven.

TRUCK FEE BILL KILLED.

Massachusetts House of Representatives Votes Against Registration Plan.

The proposition to increase the registration fees for commercial motor vehicles in Massachusetts has been defeated in the house of representatives by a vote of 66 to 126. This is the bill which has occasioned so much discussion among motor truck owners and users in that commonwealth.

When the matter came up in the house of representatives May 29 several amendments were offered, one of these providing for a fee based upon the horsepower instead of the tonnage. All amendments were defeated, before the final and decisive action was taken.

OKLAHOMA'S HIGHWAY COMMISSION.

Non-Residents Are Not Exempt from Registration Provision in New Law.

The new highway commission of Oklahoma is now being organized under the provisions of the law passed during the recent legislative session. Unless some additional provisions are made, it would appear that this body would have but very little to expend upon roads. The salary of the state highway commissioner is placed at $2500, with an additional allowance of $1500 for travelling expenses. The provision for the registration of automobiles follows:

For the purpose of carrying out the provisions of this act, and to create a fund for the maintenance of this department, a state license fee of $1 shall be charged annually the owner of each automobile owned by him. Said license fee shall be collected by the state highway commission, and shall be used for the payment of the salary of the highway commissioner provided for in this act, and the expenses of said office. Any surplus from the above said amounts is to be paid into the state treasury. The state highway commissioner shall issue to the owner of said automobile the license, duly signed and sealed with the seal of his department, together with proper description for the proper identification of such automobile license, record of which, together with the number of the license, shall be made in the office of the state highway department. And no automobile so owned shall be operated within the state without having paid such annual state license, under penalty of the law in such cases made and provided. Non-residents operating automobiles within this state shall be required to pay the same license as provided for in this section. Nothing in this act shall be construed to interfere with the rights of cities and towns to license and regulate automobiles through the streets of such cities and towns.

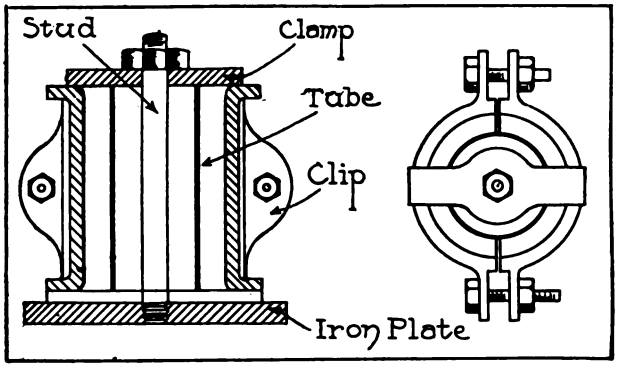
LEGISLATIVE BRIEFS.

The city engineer of Baltimore, Md., has introduced an ordinance in local city council entirely prohibiting the use of motor trucks on certain streets.

The Pennsylvania senate has defeated the bills introduced to increase the registration fees for automobiles and to regulate the use of motor trucks and traction engines.

A new ordinance in New York City stipulates that the operator of a motor car shall not approach within eight feet of a surface car which has stopped to discharge or take on passengers. In streets which are so narrow that the automobile cannot pass the car at a distance of eight feet, the operator is expected to stop.

Secretary of State May of New York has requested the police of New York City to investigate all cases of alleged fictitious names and addresses given by persons making application for and obtaining automobile licenses. The maximum penalty for violation of this section of the law is $50.



Alderman Burnett of Detroit has introduced an ordinance in that city requiring fenders on all motor trucks of more than one ton capacity. It provides that a fender capable of being raised and lowered by the operator must be placed on each vehicle, the life saving apparatus to be approved by the police commissioner and the commission of public works.

THE REPAIR SHOP AND THE GARAGE.

Jig for Remetalling Bearings---Straight Edge for Verifying the Alignment of Bearings with Wristpin---Suggestion for Hardening Tools.

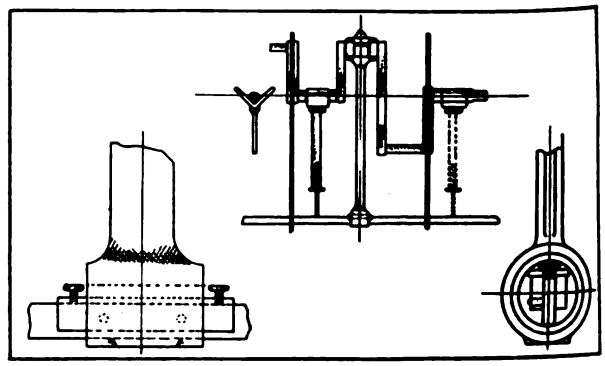
THE remetalling of bearings requires care if satisfactory results are to be secured. In an accompanying illustration is presented a suggestion for a jig which is aid to prevent blow holes and to provide a smooth bearing surface. It comprises a stiff iron plate of suitable dimensions and drilled to receive the stud member. The clamp, which is shaped to leave a space for pouring the metal between the inner side of the bearing and the tube, is secured to the stud as shown.

Suggestion for a Jig for Metalling Brasses for Big End Bearings.

Between the edges of the brasses are placed graphited tin strips secured by a clip. To prevent leakage of the molten metal from the bottom a piece of asbestos packing is utilized. This arrangement permits of metalling a pair of brasses at a time. If care be exercised in heating the brasses the old metal may be removed without injuring the tinned surfaces. It is important that there be a sufficient number of holes in the shell for securing the new lining in addition to the tinning.

VERIFYING BEARINGS.

Extreme care in fitting and scraping bearings does not necessarily mean that the axis of the bearing will be exactly in line with the wristpin. The centre line of the wristpin bushing will frequently be found to be inclined toward the centre line of the crankshaft, owing to the fact that the connecting rod has become slightly bent or out of alignment. It is not always easy to detect the defect before assembling and to facilitate matters the special straight edge shown in an accompanying illustration will be of service.



If it is used in connection with a length gauge, one having a V block at one end and a screw extension at the other extremity, the slightest variation from trueness in the horizontal plane may be noted readily. Similar misalignment in the vertical plane may be discovered by using an ordinary straight edge. It will be noted that provision is made for adjustment in order that worn wristpin bushings or those of larger or smaller dimensions than standard may be accommodated, two set screws being provided for this purpose. Other set screws in the side of the straight edge permit the taking up of any slack sideways.

A HARDENING HINT.

Brittleness of small cutting tools, drills, taps, etc., may be prevented and economy effected by plunging the part into a cake of soap or wax after hardening when being cooled.

TEMPERING SCREW DRIVERS.

Occasionally one will pick up a screw driver that is too soft. While they should be hardened to a degree of toughness, beyond that is not necessary as they are not called upon to do any cutting. When water is used for hardening it has a tendency to make the metal too hard. Oil is superior. If water is to be used it should be heated until it reaches nearly the boiling point.

Special Straight Edge for Verifying the Alignment of Bearings with Wristpins, Etc.

FEATURES OF NOBLE BI-FUEL CARBURETOR.

A CARBURETOR using either gasoline or kerosene, or both, has been brought out in England by W. Noble and it will be noted from the accompanying part sectional illustrations that two distinct float chambers are provided. From each of these float chambers leads a jet which is shown at B Fig. 2. The tip of each jet passes into a choke tube C, the bottom end of which is provided with means for adjusting the amount of air passing the jet. Both choke tubes extend into the chamber D, which has a rotating sleeve valve. The latter makes it possible to cut off either the gasoline or kerosene supply, or to utilize both fuels simultaneously.

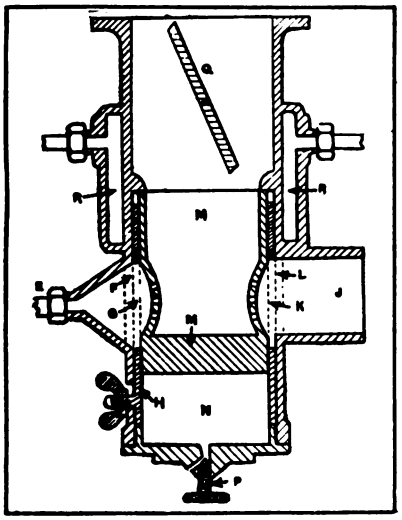

Fig. 1—Mixing Chamber of Noble Bi-Fuel Carburetor.

From the chamber D the rich mixture is led into a vaporizing tube E, which passes into and along inside the exhaust branch, finding exit through a packing gland at the front end of the motor, whence it is led to a mixing chamber illustrated at Fig. 1.

The gas from the vaporizing tube E passes through a slot F in the wall of the mixing chamber and a corresponding slot G in the sleeve H. The latter is employed for adjusting the proportions of gas and air to provide a correct mixture. Additional air enters the mixing chamber by the way of the pipe J from an open ended warming jacket around the exhaust pipe. The slots K and L correspond more or less according to the position of the sleeve H, which also has a rotary movement, so that these slots also work in conjunction with the slots F and G. The slots on both sides of the sleeve H are uncovered internally by a piston M, which rises or falls according to the negative pressure in the mixing chamber, this pressure being governed by the position of the throttle and speed of the engine.

The piston M has holes communicating with the slots in the walls of the chamber, these apertures allowing the air and gas to pass through to the motor. Below the piston is a dash pot space N having an adjustable screw P. A hot water jacket R is also embodied in the mixing chamber casting.

The slow speed is adjusted by moving the sleeve H vertically, and when the desired position is obtained the sleeve is locked by means of a wing nut. The carburetor includes the conventional butterfly throttle valve, this being shown at Q and being located above the piston member.

The engine is started on gasoline and as soon as the exhaust pipe attains a certain temperature the two-way valve is utilized, bringing kerosene into service. In either case a rich mixture is provided, and the fuel is vaporized in its passage along the vaporizing pipe E. The level of both fuels is controlled by means of floats and needles in the conventional manner.

After a long series of tests in which many American and foreign cars competed, the Canadian government has purchased a fleet of Studebaker roadsters, made by the Studebaker Corporation, Detroit, for the use of Dominion officials at Regina and in the service of the Northwest Mounted Police.

That the motor car is becoming more and more accustomed to deep sea travel has become apparent through the rush of inquiries on European motor tours received by the foreign department of the Touring Club of America. Hundreds of motorists are to ship their cars to Europe this year and will tour with their own equipment.

GARAGE AND REPAIR SHOP EQUIPMENT.

THE Taylor Manufacturing Company, West 14th street and 48th avenue, Chicago, is marketing a new mechanically operated portable tire pump for garage service that presents interesting features because of its convenience and compactness. The pump proper is driven by a .25 horsepower electric motor, which is constructed either for direct or alternating current and for varying voltages.

Air Chamber of Noil Pump.

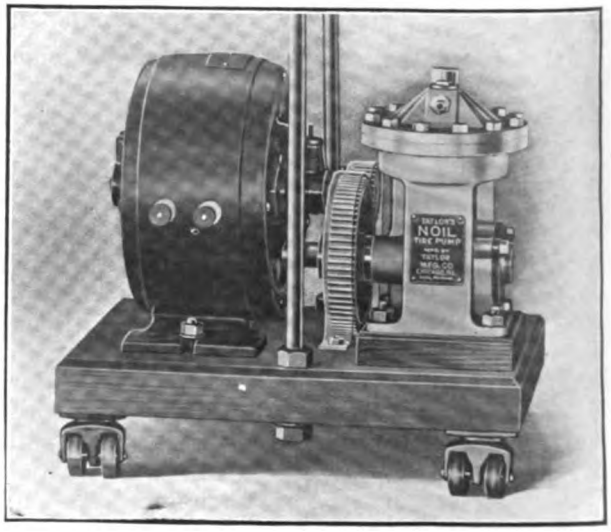
The outfit, which is shown in an accompanying illustration, is mounted on a heavy golden oak base and may be moved easily about the garage, it rolling on four heavy steel casters. A looped steel handle is provided, and its weight makes for convenience in operation.

The motor is mounted beside the pump and drive from the former is by means of steel pinions and cast iron gears. The equipment is very complete, including 15 feet of high grade flexible hose with connection and pressure gauge and 15 feet of electric wiring and socket.

The pump itself is known as the Noil, so named because its operation precludes all possibility of lubricant or oily vapors being carried with the air into the inner tube when inflating. The pump works on the plunger-diaphragm principle, and it is held that frictional heat is eliminated. It is but 7.5 inches high, weighs but 6.5 pounds and employs no leather cups, etc.

The crankcase is of aluminum and gears and plunger of solid bronze. The plunger is specially constructed and it is claimed that it will withstand a pressure of 1000 pounds. As will be seen from the accompanying illustration showing a cross section of the pump, its air chamber is independent of the crankcase, being separated from it by an air tight rubber diaphragm which forms the base of the air chest. Since no lubricant enters this chamber no oil can be discharged. One of the qualities claimed for the Noil is that it will deliver a steady flow of air and that it will supply from 90 to 150 pounds at low speeds.

TAPE GRIP WATER JOINT.



Herz & Co., 295 Lafayette street, New York City, is manufacturing the Tape Grip water joint, a device for making a connection between rubber hose and a metal pipe, such as the outlet manifold and the radiator. Rotating a ring member winds the tape firmly. It is held that it may be as easily displaced, and may be utilized over and over again.

RADICO.

The Radico Manufacturing Company, Springfield, Mass., is marketing a new compound known as Radico, which is guaranteed to stop leaks in radiators or other sections of the cooling system and without injuring the components. It is claimed that Radico will cure a leak in 15 minutes.

TAD'S TROUBLE FINDER.

The Toledo Auto Devices Company, Toledo, O., has brought out what may be termed a mechanical stethoscope, called Tad's trouble finder. It is designed for locating mysterious noises which may develop in the power plant. The finder is made of wood and metal and is inexpensive.

BRITISH ENGINEERS IN NEW ENGLAND.

Representative Delegation Inspects Eastern Plants After Conclusion of Midsummer Meeting on Lake Huron—Some Impressions at the Close of the Trip.

THIRTEEN of the 27 members of the party representing the Institution of Automobile Engineers of Great Britain reached New England, June 11, but one of these, Secretary Basil H. Joy, left the party at Pawtucket, R. I., going immediately to Montreal, from which port he sailed June 14 after completing certain business matters. President and Mrs. T. B. Browne left the party at Buffalo, N. Y., June 10, returning to their home in England by way of the Pacific Coast and the Far East. The remainder went direct to New York City from Buffalo, sailing June 11 on the Mauretania.

After the return from the trip on Lake Huron, included in which was the midsummer meeting of the Society of Automobile Engineers, the party left Detroit the evening of June 8 for Cleveland, taking the Detroit & Cleveland Navigation Company's boat. Cleveland was reached early Sunday morning, and the party was escorted immediately to the Hotel Stadler. The day was spent in a round of entertainment at country clubs in that vicinity.

British and American Engineers Leaving the Boat at Sault Ste. Marie, Mich.

Monday was devoted to an inspection of the plants of the White Company, the Peerless Motor Car Company and the Winton Motor Car Company, although several members of the party took advantage of the opportunity to visit the factory of the Goodyear Tire & Rubber Company in Akron. That evening another boat was taken for the trip to Buffalo, where after inspecting the plant of the Pierce-Arrow Motor Car Company those who were to remain behind visited Niagara Falls.

Wednesday morning they caught their first glimpse of the New England hills. Upon their arrival in Pawtucket the entire arrangements for the remainder of the trip were placed in charge of Coker F. Clarkson, secretary of the American society, who had accompanied the visitors since their arrival in New York, and three hearty British cheers were given Secretary Joy as he stepped back on the car platform for the commencement of his homeward journey.

Mrs. E. B. Wood was the only woman member of the party who visited New England. During her stay in Rhode Island she was the guest of a Providence committee, composed of Mrs. F. P. Nehrbas and Mrs. W. A. Viall, who took her on a boat ride to Newport for the day.

The engineers were entertained at breakfast at the To Kalon Club as the guests of the Potter & Johnston Machine Company, after which they inspected that plant. The trip from Pawtucket to Providence was made by motor 'bus. In the latter city the plants of the American Locomotive Company and the Brown & Sharpe Manufacturing Company were visited, and a dinner was tendered the party at the Country Club.

The party left Providence about midnight for Bridgeport, Conn., which was reached Thursday morning. After breakfast at the Hotel Stratfield the plants of the Locomobile Company of America and the Spring Perch Company were inspected. Luncheon was served with the former

Digitized by Google

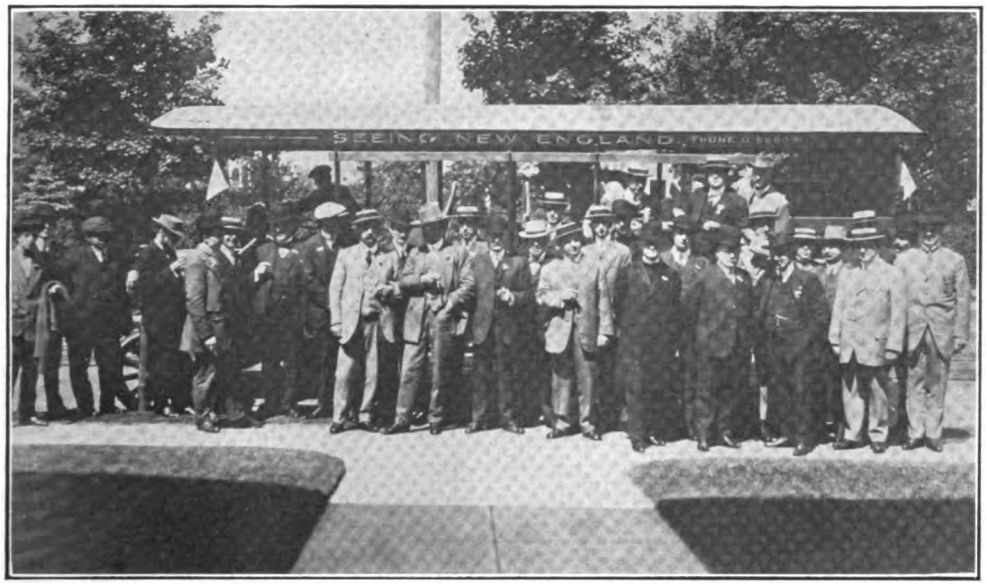
company as host and the party left by motor car for New Haven, visiting the factory of the New Haven Carriage Company.

Thursday night was spent at the Hotel Taft. The next morning the automobiles were impressed into service again for the trip to Hartford, where the plants of Pratt & Whitney, the Pope Manufacturing Company and the Hartford Rubber Works division of the United States Tire Company were inspected. The trip was brought to an official close Saturday morning, June 14, upon the arrival of the Hartford boat in New York City.

Those who took advantage of the New England trip had had three weeks of hard work, and on a minimum amount of sleep. One of the members of the party declared he was going to sleep as soon as he reached his stateroom and did not expect to awake until he arrived in England. They were tired, but they had taken advantage of every opportunity to study American production methods.

The consensus of opinion among the visitors appeared to be that America is producing cars which compare favorably with those which are manufactured in any country, and while there may be difference of opinion as to the relative merits of any particular make of machine, the American product is worthy of competing with the British. There was no attempt on their part to differentiate between what they had observed in any one city or plant, but there was evidence in their conversation upon the subject that they were particularly impressed with the industry as represented in Detroit.

With respect to motor starters, a subject with which they had had little previous opportunity to familiarize themselves, there was suggestion that within another twelvemonth there would be quite a different story to tell in Great Britain. "But one concern in Great Britain has taken up this matter," said Charles Wheeler, "and this has not placed any self-starting cars on the British market. Practically the only make of this type now sold there is an American car. It is ridiculous, when you stop to think of it, that we should do a bit of hand organ grinding every time we want to take a ride. It has got to come and before another year you will see a large number of self-starting cars made in England."



Mr. Wheeler is in charge of the motor driven equipment of the postal department for the United Kingdom, and it would appear that decidedly greater attention has been paid to this matter in England than in this country. He stated that practically all horse drawn vehicles had been eliminated, and that in many instances motor trucks were doing the work formerly left to the railroads.

He also explained that there was decided interest in the matter of the so-called char-a-banc, virtually a motor 'bus, but much more elaborately furnished than those in use in this country. Both Mr. Wheeler and R. W. Smith were of the opinion that such vehicles would see larger service in the smaller towns in America. Char-a-bancs are operated in England instead of trolley cars in many of the outlying districts and for transportation between the railroad stations and many of the hotels.

British Engineers at Play During the Halt at Mackinac Island, Between Sessions of the Midsummer Meeting.

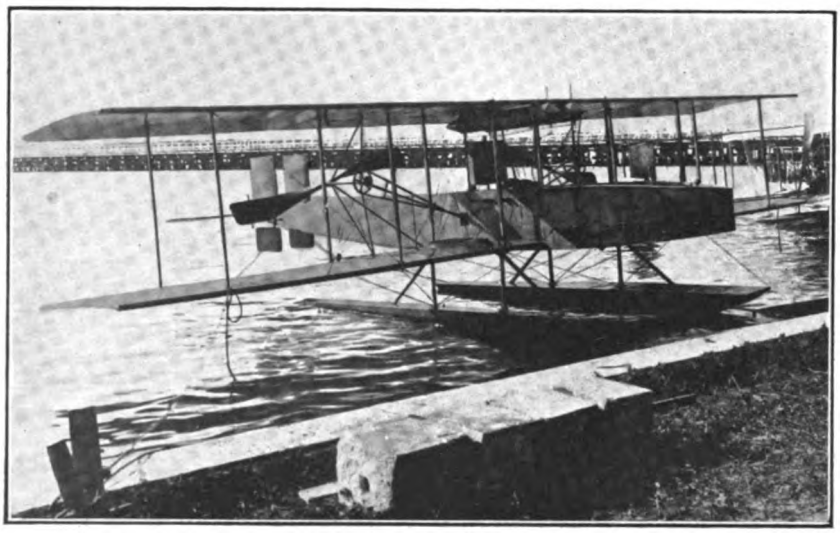
Members of the New England Party at Potter & Johnston Plant, Pawtucket, R. I.

It was stated that electric vehicles were not much used, the reason assigned being that the country was too hilly. Upon more mature reflection, and when it was pointed out that electric commercial vehicles were utilized to advantage in America even under such conditions, it was suggested that possibly the reason could be assigned to lack of initiative. On the other hand, steam vehicles meet with a much better reception in England than in America.

The matter of roads is one concerning which much has been published in Great Britain. It was on the trip between Pawtucket and Providence that the visitors became enthusiastic upon this subject. When turning into Blackstone boulevard, practically every member of the party exclaimed that they must be back in England. E. C. Paskell explained that the surroundings were typical of a country lane in the home country, and Mr. Wheeler stated emphatically that the finest roads they had observed anywhere in this country were those over which they were then travelling.

It is impossible, in the space available to quote all of the impressions voiced by the visitors toward the end of their trip. They had seen and absorbed a large amount of information and were distinctly of the opinion that the three weeks had been well spent. They were equally certain that much that they had learned would be reflected in the future production of Great Britain, although the so-called American invasion was carefully avoided in summing up their impressions.

The 10,000 employees of the Willys-Overland Company and the Kinsey Manufacturing Company, a subsidiary concern, Toledo, O., have been notified that after Aug. 1, 50 hours will constitute a week's work instead of 54 hours. The decrease does not carry any reduction in wages with it.



British Visitors and Their Hosts upon Their Arrival at American Locomotive Company's Plant in Providence, R. I.

BURGESS COAST DEFENSE HYDRAEROPLANE.

THE Burgess Coast Defense hydraeroplane, presented herewith, has several features which distinguish it from any other aeroplane yet constructed. Among these may be mentioned the long enclosed body, in the bow of which the aviator and passenger are arranged in tandem, well forward of the supporting surfaces, so that both members of the crew have an unobstructed view in all directions. The maker is the Burgess Co. & Curtis, Marblehead, Mass.

The power plant is a six-cylinder Sturtevant motor. This is located amidships, back of the crew, and drives twin propellers by a long chain and sprocket gear. The empennage, including the elevator and double rudders, is similar to the model H, which preceded it. The supporting surfaces are built very nearly flat with a slight reverse curve and are covered with strong linen, surfaced with a special composition which is held to produce an unusually smooth and flexible finish. The hydroplane hulls are two in number and are of novel design, the bottom sloping down to an angular step under the centre, while the aft half is of concave cross section.

The Burgess Coast Defense Hydraeroplane Which Has Proved Successful in Service with the United States Signal Corps.

The principal dimensions are: Spread of wings, 39 feet 10 inches; length over all, 31 feet five inches; length of enclosed body, 29 feet seven inches; height from bottom of hull, nine feet six inches; depth of wing, six feet three inches; area of main surfaces, 484 square feet; weight, empty, 1500 pounds.

The motor is equipped with an efficient muffler, which is of decided importance in military service, this machine having been designed for and used by the United States signal corps. Twin Zenith carburetors are utilized, and the ignition is by a Mea magneto. The machine is fitted throughout by R. I. V. ball bearings, these being supplied through the New England distributor, F. Shirley Boyd, 903 Boylston street, Boston.

A new cross country record was established June 10 by Marcel G. Brindejonc des Moulinais of Belgium, who flew from Villacoublay, near Paris, to Warsaw, Russia, a distance of 900 miles, with but one stop, that being at the Johannisthal flying field, Berlin, Germany. The aviator left Villacoublay at 4 in the morning and reached Berlin shortly after noon. He left Berlin at 3:40 with St. Petersburg, 1699 miles from Paris, as his objective point, and arrived at Warsaw at 6:15. The make of machine was not stated in the dispatches, but it is presumed that he used a Morane-Saulnier, as that is the make he has been flying.

A new altitude record for a pilot and six passengers was established by Frangeois of France in a Savary biplane at Chartres, France, last month, when he reached a height of 2789 feet. The previous mark was held by Frantz at 2133 feet. The duration of the flight was 1:13:25, which is also a new mark.

The Aero Club of France has decided that the second trials for the $10,000 Michelin target prize shall be held at Chalons during the weeks of June 15-22, July 13-20, Aug. 10-17 and Sept. 7-14.

Fifteen members of the Aero Club of Philadelphia have volunteered to make up the "fourth arm" of the Pennsylvania National Guard, an aviation corps having been established to work in conjunction with the signal corps of the United States Army.

Of particular interest is the recent prosecution of Brindejonc des Moulinais of Belgium for violation of the new law in Great Britain forbid-

Digitized by Google

ding foreign aviators to land in the United Kingdom without first notifying the home office of the trip and the intended landing place, and also with having flown over a part of the United Kingdom without having first alighted in one of the official prescribed areas. The defendant pleaded guilty, explaining that he was not aware of the existence of the law. Upon his promise not to repeat the performance and to request the Aero Club of France, of which he is a member, to advertise the laws of foreign countries in this respect, he was permitted to depart upon his own recognizance in the sum of 1000 francs.

TACOMA ROAD RACES.

Sixteen Cars Already Entered for Events Scheduled for July.

With 16 entries already listed, including the well known drivers, Tetzlaff, Burman and Oldfield, and others promised, the automobile road races for 1913 at Tacoma, Wash., July 5-6, promise to furnish an opportunity for creating new world's dirt track records. The 3.5-mile course is being given constant oiling and rolling and is already in excellent condition. The prizes to be offered will aggregate $10,500, including the $5500 award for the Montmarathon. The complete list of entries to date is as follows:

July 5, Inter-City Century Trophy.

Car	Entrant	Driver
Stutz	E. J. Cameron	Cameron
Simplex	C. H. Hooper	Hooper
American	M. MacLeod	MacLeod
Cole	Frank A. Tauscher	Tauscher
Apperson	W. L. Alfred	Nickels
Reo	H. M. Prince	.....
Stutz	Stutz Motor Car Company	.....

July 5, Golden Potlatch Trophy, 200 Miles.

National	Charles M. Thomsen	Taaffe
Locomobile	C. L. J. Welch	Welch
Stutz	Stutz Motor Car Company	.....
Fiat	E. E. Hewlett	Tetzlaff
Stutz	Earl Cooper	Cooper
Mercer	Walter Hempel	Oldfield

July 6, Montmarathon Trophy, 250 Miles.

National	Charles M. Thomsen	Taaffe
Locomobile	C. L. J. Welch	Welch
Stutz	Stutz Motor Car Company	.....
Fiat	E. E. Hewlett	Tetzlaff
Fiat	E. E. Hewlett	Magone
Benz	E. A. Moross	Burman
Benz	E. A. Moross	Carlsen
Stutz	Earl Cooper	Cooper
Mercer	Walter Hempel	Oldfield

NATIONAL RELIABILITY TOUR.

How Eastern Contestants May Best Reach the Starting Point.

No event in motoring will be more typical of the nationalizing influence of the motor car on the country than the American Automobile Association's national reliability tour, which in July will traverse Minnesota, North Dakota and Montana, for it will typify in a larger way the best utility of the motor as an invader of "new country," because to a majority of people East and West, those states lie in a region which is comparatively little known.

In the tour many business men, particularly from the East, have recognized an opportunity for an educational vacation under auspices which eliminate all thought of the discomforts sometimes attendant upon travel through a country where motorists are not plentiful. For those residing along the Atlantic Coast the tour offers unique possibilities. Cars may be shipped from Buffalo by steamer through the Great Lakes to Duluth, Minn. Thence there is a drive of 175 miles to the twin cities of St. Paul and Minneapolis, from which point the tour will start July 11 and terminate at Midvale, the northern gateway to Glacier national park, July 19.

TWELVE ENTRIES FOR COLUMBUS.

Third Annual 200-Mile Dirt Track Event Scheduled for July 4.

The third annual 200-mile race, which is the classic dirt track event of the season at Columbus, O., will be held in that city July 4. The track of the Columbus Driving Association, upon which the race will be run, is considered the best dirt course in the country and upon it all of the records from 75 miles to 200 miles have been made. It is also the first track in the country to stage a 24-hour race and the record for such a contest was held by it for some time.

Twelve cars will be started in this year's event, some of which participated in the 500-mile race at Indianapolis, Memorial Day. In order to prevent dust the committee will use 30 tons of calcium chloride. The Baker electric timing apparatus will be used to secure the proper scores. The committee in charge consists of: Chairman, L. M. Browne; J. C. McIntyre, Frank J. Girard, F. H. Thorpe and J. W. Means.

A Studebaker machine, made by the Studebaker Corporation, Detroit, and driven by Harry Hooker of Hollywood, Cal., recently accomplished the ascent of Mount Wilson, an altitude of 6000 feet, while carrying four passengers. Although often within but a few inches of the edge of the rough, tortuous trail, it was never necessary to back the car in order to get it around the many sharp turns.

IN THE REALM OF THE MOTORCYCLIST.

Details Arranged for the First National Motorcycle Road Race at Elgin, Ill., July 4---Plans for New York and Chicago Shows---Tourist Trophy Results.

WITH many of the fastest riders and machines in the country entered, the first annual national motorcycle road race will be held over the Elgin course at Elgin, Ill., near Chicago, July 4. The contest is being promoted by the Chicago Motorcycle Club, which has raised over $15,000 for the event. There will be two classes, the amateur and professional. The professional race will be 250 miles for stock machines of 61 cubic inches or under. The first three cash prizes will be $500, $250 and $100 in gold coin. The amateur race will be for 174 miles and the value of the first three prizes will be $250, $125 and $75.

As this will be the first national motorcycle road race ever held in America, it is expected that about 100,000 persons will be in attendance at the course, which will be guarded by the state militia. When the entry blanks had been out a week 48 entries had been promised and several of the motorcycle factories have entered teams. The Indian team will be composed of Charles Balke and Raymond Seymour, two California riders, who have broken many world's records on the board tracks; Charles Gustafson, the 24-hour record holder, and E. G. Baker of Indianapolis. It is stated that the Merkel, Jefferson, Yale, Excelsior and Dayton factories will enter teams for the event, having so notified Chairman R. H. Hill of the Chicago Motorcycle Club's contest committee. F. L. Valiant of the Miami Cycle & Manufacturing Company will act as starter.

Party of Recent Motorcycle Visitors to the Flying Merkel Plant of the Miami Cycle & Manufacturing Company, Middletown, O.

New York and Chicago Shows.

At its regular meeting at Buffalo, N. Y., the Motorcycle Manufacturers' Association voted to incorporate under the laws of New York State. The next meeting will be held at Atlantic City, N. J., Aug. 6, in connection with the meeting of the Cycle Parts & Accessories Association. The show committee was authorized to make the best arrangements possible with Manager S. A. Miles for a motorcycle show in connection with the automobile show in Grand Central Palace, New York City. It was decided to hold the Chicago show at the Coliseum the first week in November.

Tourist Trophy Results.

In the Senior Tourist Trophy race on the Isle of Man, the winner was T. Wood, who rode a Scott motorcycle, while second place was taken by A. R. Abbott on a Rudge, and third by J. R. Alexander on an Indian. The Indian entries were all singles, and the performance of the five machines taking part is considered excellent. Aside from third place, Indian machines finished as follows: C. B. Franklin, fourth; Brown, 10th; George, 14th; A. H. Alexander, 26th. These scores were made in a field of 103 entries. The features of the winning Scott model include a new design rotary valve and new type of Hans Renold chain.

In the Junior Tourist Trophy event the winner was Hugh Mason on a 2.75 horsepower N. U. T. machine, S. A. Newman being second on a Precision and W. F. Newsome on a Douglas, third.

A cable from the Bosch Magneto Company, London, announces that the winning Scott machine was equipped with a Bosch magneto. Bosch also was the equipment of the third and fourth machines to finish in the senior event.

Thiem Increases Capital.

It is stated that the Joerns-Thiem Motor Company, St. Paul, Minn., maker of Thiem motorcycles, is to increase its capital stock to $500,000

Digitized by Google

Merkel's Road Race Team.

At the 250-mile motorcycle race at Elgin, Ill., July 4, the Miami Cycle & Manufacturing Company, Middletown, O., will be represented by four well known riders, L. S. Taylor of Middletown, Ray Snyder of Columbus, O.; Ray Bowser of Chicago, and Herman Sill of Cleveland. These riders are fast and the Merkel machine may be expected to be among the leaders throughout the race.

Addition to Saddle Plant.

The H. & F. Mesinger Manufacturing Company, New York City, has nearly completed a 50 by 60-foot extension to its new factory at Austin place and East 114th street, to be devoted exclusively to the manufacture of saddle springs, necessitated by the steady and rapid growth of business in Mesinger saddles. The addition will be in full operation by Aug. 1.

Indian Wins Century Event.

The Allegheny Motorcycle Club's 100-mile race, held at Brunots Island track, Allegheny, Penn., was won by A. G. Schmidt on an Indian machine. His lead was about two miles. H. H. Giesey, a novice rider, also riding an Indian, was second, and J. M. Davis on an Excelsior, was third. The time made by Schmidt for the 100 miles was 1:45:35.

Death of W. K. Aurandt.

The Miami Cycle & Manufacturing Company, Middletown, O., maker of Merkel motorcycles, through its president, K. R. Jacoby, announces with regret the death at Altoona, Penn., June 13, of W. K. Aurandt, who was connected with the concern and who was well known in motorcycle circles.

Spanish Road Race.

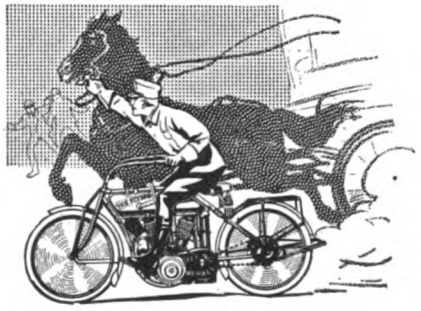
Julian Olave, Indian dealer at San Sebastian, Spain, will enter a team for the Spanish international road race to be held Sunday, July 20. The race is from San Sebastian to Bilbao, a distance of 100 miles.

New Mile Board Track.

The Dodge City Motorcycle Club of Dodge City, Ia., has decided to build a one-mile board track, upon which to hold races when the run of the Short Grass Touring Club passes through the city in July. The track will be banked at the turns with four-foot embankments.

Merkel Takes Twin Award.

At the recent hill climb at Toronto, Can., G. Bilton on a Flying Merkel motorcycle with sidecar and passenger, won the event for twins. The meet took on the aspect of an international affair, as American machines were pitted against those of English make in many of the matches. The American riders were returned victorious. Following is the summary:



Twins, 7 horsepower, with sidecar and passenger—First, G. Bilton, Merkel; second, Bert Webb, Indian; third, C. Macdonald, Excelsior; fourth, Stephen Wilkins, Indian; time, 0:25.

Singles, 4 horsepower, with sidecar and passenger—First, H. Greenwood, Triumph; second, P. Barnes, Triumph; time, 0:44.8.

Seven horsepower—First, C. Macdonald, Excelsior; second, Bert Webb, Indian; third, G. Bilton, Merkel; fourth, Stephen Wilkins, Indian; fifth, A. Vann, Merkel; sixth, C. J. Spiers, Excelsior; seventh, Arthur Shuttleworth, Jefferson; eighth, Walter Andrews, Merkel; ninth, J. Plowman, Excelsior; 10th, Robert Barton, Matchless; time, 0:19.8.

Four horsepower—First, F. Miles, Indian; second, Arthur Shuttleworth, P. E. M.; third, Bastedo, Triumph; fourth, W. Morrison, Excelsior; fifth, Burgess, Triumph; sixth, W. Banfield, Triumph; seventh, T. Smith, Douglas; eighth, P. Barnes, Triumph; ninth, H. Greenwood, Triumph; 10th, Bert Webb, Indian.

For flexibility special prizes were awarded to the following: Singles—H. Greenwood, Triumph; H. Burgess, Triumph. Twins—A. Vann, Flying Merkel; C. Macdonald, Excelsior.

ALWAYS READY FOR ANY EMERGENCY!

With its ability to pick up speed quickly—(60 miles an hour from a standing start within a city block)—the 1913 Flying Merkel Motorcycle is always ready for instantaneous use. These features and the fact that the Flying Merkel Motorcycle is the most economical in the world to operate has led to its universal adoption by Police Departments, Park Boards, Gas Companies, Telephone and Electric Light Companies and all other business concerns and individuals whose requirements demand a sturdy, reliable motorcycle at the minimum cost of upkeep. Remember, the Flying Merkel

"Made Its Name on Merkel Mileage."

New Registered Repair Shops.

Following are the new repair shops registered with the F. A. M.: Harwood & Minton, Sixth

Morris Ross, Providence, R. I., and His Indian Mount.

avenue and Commerce street, Nashville, Tenn.; W. R. Garcelon, 520 High street, Palo Alto, Cal.; Charles A. Williams & Son, 609 Main street, Zanesville, O.; Coleman's Motorcycle Shop, 43 Bowery street, Akron, O.; The Big 4 Auto Company, 15 North Cascade avenue, Colorado Springs, Col.; Sterling Motor Company, Darien, Conn.; Hobbie Automobile Company, Maple and Fourth streets, Hampton, Ia.; Perfection Cycle Company, 220½ Main street, Conneaut, O.; Astoria Garage, 565 Duane street, Astoria, Ore.; G. W. Beardsley, 1120 Texas avenue, Houston, Tex.; Arvid Anderson, Fourth and Locust streets, DeKalb, Ill.; Chapin & Kibbe, 1552 Riverside street, West Springfield, Mass.

Pope Man Secures Promotion.

J. P. Fogarty, who for 17 years has been connected with the Pope-Hartford Manufacturing Company, Hartford, Conn., maker of Pope motorcycles, has been appointed manager of the motorcycle plant at Westfield, Mass. He succeeds E. E. Hinsman, who has resigned.

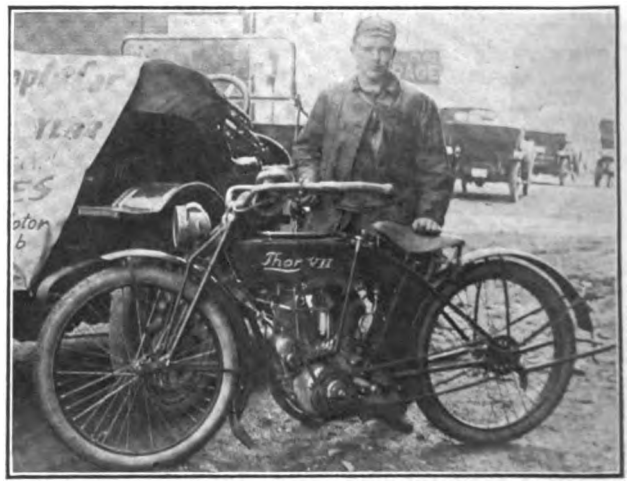
De Luxe Needs More Room.

The Excelsior Cycle Company, Chicago, maker of the De Luxe motorcycle, has made arrangements for the addition of another story to its plant and also for securing of adjoining property for stockrooms. This action is taken to make room for a greatly increasing output.

Merkel Announces Racing Policy.

It is announced by Advertising Manager F. L. Valiant that in keeping with the attitude of many motorcycle makers in oppositon to board track racing, the Miami Cycle & Manufacturing Company, Middletown, O., maker of Merkel machines, has decided to recall all Merkel racing models that are not owned outright by competing riders. The position of the Merkel company is that racing with ported machines has outlived its usefulness to the trade and in the future none of this type of motorcycle will be manufactured. Those machines which have competed recently are owned by their riders and the Merkel company has no riders drawing salaries.

Recent Commissioner Appointments.



President Patterson of the F. A. M. has appointed as state commissioners, Philip Kennard, Tampa, Fla., and Dr. A. L. Gindrup, 234 Main street, Salt Lake City, Utah. Following are the county commissioners that have been designated by the Ohio state commissioner: Paul H. Sheridan, Youngstown, O., for Mahoning county; Tide Davenport, Portsmouth, O., Scioto county; Robert Carroll, 403 Rensselaer street, Bucyrus, O.

New Cyclecar Company.

That some persons in the motorcycle trade believe in a future for the cyclecar is shown by the incorporation under the laws of Arizona of the California Cyclecar Company, with a capital of $50,000. The concern is an offshoot of the California Motorcycle Company of Los Angeles, western distributor of Eagle and M-M motorcycles.

Michaelson in New Building.

The Michaelson Motor Company, Minneapolis, Minn., maker of the Michaelson motorcycle, has moved into its new building and is planning for an increased output for 1914. The Minneapo-

Glen Crandall of Boston, Well Known Thor Racing Rider.

lis Motor Company of the same city is also branching out, having made additions to its brazing and blacksmith shops in preparation for the

Digitized by Google

1914 trade, which indicates that the Minneapolis concerns are enjoying prosperity.

Thor Is Nearly All Moved.

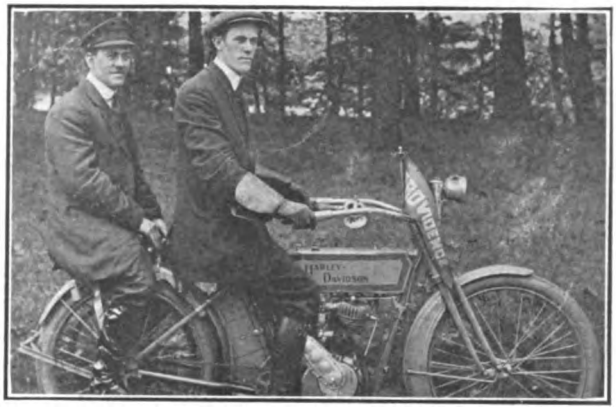
The new factory at the corner of Sedgwick and Huron streets, Chicago, recently secured by the Aurora Automatic Machinery Company, maker of Thor motorcycles, is ready for occupancy and the transfer of machinery from Aurora, Ill., is being carried forward. Operations are expected to begin by July 1 and the full equipment is expected to be installed by the middle of July.

Long Distance Sidecar Trip.

George M. Beckett, a member of the Pittsburg Motorcycle Club, Pittsburg, Penn., accompanied by Mrs. Beckett, recently left that city on a motorcycle tour of the North Atlantic states. They are riding an Indian with sidecar attachment and before they return they will visit Harrisburg, Philadelphia, Atlantic City, New York, Providence, Boston, Springfield, Albany and Buffalo.

Motorcycle Patrols for A. L. A.

The Automobile Legal Association, in the interests of law enforcement, is employing special policemen, mounted on powerful motorcycles, to patrol roads in Rhode Island, Massachusetts and southern New Hampshire, to secure evidence of reckless automobile driving or driving while intoxicated. The work will not be confined to this feature only, but evidence will also be gathered against drivers of horse vehicles who do not conform to the laws requiring lights on their wagons after dark.



New Members in May.

The registrations with the Federation of American Motorcyclists for May totalled 918, which is an exceedingly good month for new members. The various states were represented as follows: New York, 152; Ohio, 146; Indiana, 73; Texas, 69; Pennsylvania, 59; New Jersey, 57; Illinois, 48; Maryland, 31; Colorado, 30; Tennessee, 29; Oregon, 27; Massachusetts, 20; Missouri, 19; Wisconsin, 19; South Dakota, 19; Nebraska, 17; Oklahoma, 14; Kansas, 14; California, 10; Michigan, eight; Virginia, seven; Georgia, six; West Virginia, five; District of Columbia, five; Iowa, five; Philippine Islands, five; Washington, three; Rhode Island, three; Louisiana, three; Kentucky, three; Minnesota, two; Wyoming, two; Florida, North Dakota, Nevada, New Mexico, Panama, Porto Rico, Mexico, one each.

Club Notes, Here and There.

The Columbia Motorcycle Club, Columbia, S. C., has reorganized with the following officers: President, Dr. Hoefer; vice president, K. W. Hollingsworth; secretary-treasurer, George M. Thayer; captain, Charles W. Cochrane. It is planned to hold a race meet later in the season on the South Carolina fair grounds track.

The National Motorcycle Club, Washington, D. C., held a most interesting run on Memorial Day to Gettysburg, Penn. A large number attended.

Two Satisfied Harley-Davidson Riders—Walter and Ernest Jackson, en Route from Providence, R. I., to Dover, N. H.

Recently 18 motorcycle riders started on a run from Niagara Falls to Lewiston, Lockport and Buffalo, and at Lewiston it was decided to hold a meeting and organize the Niagara Falls Motorcycle Club. The following officers were elected: President, Homer Cumberland; vice president, Albert Wienkie; secretary-treasurer, J. MacPherson; captain, William Coleman; lieutenants, R. H. Douglas and Sylvester Wagner.

The Fond du Lac Motorcycle Club, Fond du Lac, Wis., has a membership of 30 and has taken new quarters on East First street, where it will welcome visiting clubs.

At Vancouver, B. C., motorcycles have been barred from Stanley Park, but a committee of the Vancouver club recently held a conference with the park commissioners, who agreed to amend the by-laws, permitting the two-wheeled vehicles the privileges of the park.

1913 F. N. SHAFT-DRIVE MOTORCYCLES.

Lightweight Single, with Two-Speed Gear $275
Only Machine Built With Handle Bar Control of Clutch.
Four-Cylinder $300
With Handle Bar Control of Clutch $350
Two-Speed Gear, Extra $50
Equipment includes two brakes, footrests if desired, compound spring fork, combined luggage carrier and stand.

NEWS OF THE MANUFACTURER AND DEALER.

The following concerns have been incorporated recently to manufacture or deal in motor cars, accessories, etc.:

Darling Automobile Manufacturing Company, Britton, Okla.; $25,000; C. P. Stealey, A. W. Hedge, H. O. Crum, George E. Crawford, S. L. Sintaffer, D. L. Sellers, W. C. Settle, H. S. Emmerson, C. L. Stealey.

Chattanooga Buick Company, Chattanooga, Tenn.; $15,000; K. McKarger, George D. Lancaster, P. Campbell, H. C. McVey.

Original Puncture Fix Company, Dallas, Tex.; $5000; A. Marks, Vincent L. Hughes, A. F. Weisberg.

Sacred Heart Automobile Company, Sacred Heart, Minn.; $10,000; J. H. Sagnes, P. O. Melsneas, T. Arestad, W. A. Day, E. P. Dosseth.

Platte Center Automobile Company, Platte Center, Neb.; $15,000; E. J. Macken and others.

Auto Owners' Sales Company, Los Angeles, Cal.; $10,000; A. G. Heskett, F. L. Toombs.

Autopart Company, Los Angeles, Cal.; $10,000; H. L. Kimmell, W. C. Hanson, John H. Lane.

Michigan Motor Car Company, Memphis, Tenn.; $5000; I. Bennett, C. V. York, J. J. Carrigan.

F. P. Motor Wagon Company, Pierre, S. D.; $250,000; Thomas F. Graham, Edward E. Slade, William G. Price, R. J. Reynolds, L. L. Stephens.

Pacific KisselKar Company, San Francisco, Cal.; $500,000; G. W. Emmons, H. K. Butterfield, E. Roger Stearns, G. A. Kissel.

Empire Auto Company, Webb City, Mo.; $2400; W. L. Miller, J. Caesar, W. S. Miller.

Canham Auto Company, Wahpeton, N. D.; $25,000; Roland Canham and others.

West Motor Car Company, Topeka, Kan.; $10,000; H. G. West, F. Langley, L. Langley, J. E. Folley, F. A. Folley.

St. Louis Motor 'Bus Company, St. Louis, Mo.; $2000; Robert J. Kirkwood, James A. Rector, Walter R. Wayne.

Western Co-Operative Auto Supply Company, Topeka, Kan.; $25,000; M. T. Kemper, M. C. Wells, J. H. Walters, T. R. Paxton, J. R. Mulvane.

Variable Clutch & Variable Transmission Company, Seattle, Wash.; $100,000; to manufacture clutches and transmissions; C. E. Lawson, H. A. Emery and others.

Velie Motor Car Company, Salt Lake City, Utah; $5000; Thomas E. Kelly, J. R. Hall, O. M. Olsen.

Davis Livery & Motor Car Company, San Antonio, Tex.; $10,000; E. E. Davis, Earl Wood, R. L. Aspley.

Himeloch Auto & Taxi Company, $1000; Isaac Himeloch, Joseph Himeloch.

Liquid Tire Company, Kansas City, Mo.; $125,000; Charles S. Wright, George L. Schofield, Clay W. Prewett.

E. Landis Auto Company, Kansas City, Mo.; $5000; Emanual Landis, M. J. Oldham, W. G. Bryant, M. S. Kenney, W. J. Gregg.

American Motor Company, Galveston, Tex.; $2000; John Christensen, John Rasmussen, Gaston Weigel.

American Gas Engine Company, Davenport, Ia.; $500,000; J. E. Burmeister, A. Clifford, C. A. McCune.

Texas Carriage & Top Company, $10,000; John R. Patton, Charles E. Gardner, S. U. Turney.

WITH THE MANUFACTURERS.

The Chemical Rubber Company of Western Pennsylvania is the name of a new company organized at Pittsburg, Penn., to manufacture a tire filler. The men behind the concern are: Allen W. Pence and Charles Mesta of Pittsburg, Grant Cummings of Springdale and W. H. Snyder of Beaver. Offices will be established in People's Bank building and a factory erected on Grant boulevard.

E. L. Atkinson, general manager of the Lange Motor Truck Company, Pittsburg, Penn., is on an extended business trip, during which he will visit Baltimore, Philadelphia, New York and Boston.

E. W. Lyle, formerly connected with the Alden Sampson branch of the United States Motors Company, has recently associated himself with the Adams Bros. Company, Findlay, O., maker of Adams trucks, as superintendent.

M. Lucien Louys, director and manager of Les Fils de Peugeot Freres, manufacturer of the Peugeot racing car which won the sweepstakes prize at Indianapolis, Memorial Day, recently visited Toledo as the guest of the Willys-Overland Company, maker of Overland cars.

Samuel Hill, president of the American Road Builders' Association, at the invitation of President George McAneny of the Borough of Manhattan, and President Cyrus C. Miller of the Borough of the Bronx, New York City, recently delivered an illustrated address on "The Highways of the Northwest" before an assemblage of over 50 municipal engineers who are in charge of the highways of Greater New York.

The Metz Automobile Company, Waltham, Mass., maker of Metz cars, has opened temporary salesrooms on the second floor at 1700 Broadway, New York City. E. L. Rieser is manager.

The Gramm Motor Truck Company, Lima, O., maker of Gramm trucks, will enlarge its factory this summer. It is the intention to increase the output to 50 trucks daily.

The Goodyear Tire & Rubber Company, Akron, O., manufacturer of Goodyear tires, has commenced the construction of an elaborate factory building at Seattle, Wash., which will have a floor area of 10,000 square feet.

F. E. Moskovics, who recently resigned as sales manager of the Remy Electric Company, Anderson, Ind., has purchased an interest in the Jones Electric Starter Company of Chicago, maker of Jesco electric lighting and starting systems. Mr. Moskovics will have charge of sales and at the next directors' meeting will be elected an officer in the comapny, it is said. He has been in the automobile business 15 years, both as an engineer and sales manager. He designed and built the Yellow Bonnet taxicabs, and also designed the Allen-Kingston car in New York City.

I. W. Penniman, who has been New England sales manager of the Walpole Tire & Rubber Company, maker of Walpole tires, has been made general sales manager of the same concern with offices at 757 Boylston street. He has had wide experience in the tire business, being previously with the Goodyear Tire & Rubber Company and for four years its branch manager at Portland, Me.

George H. Duck has resigned as general service manager of the American Locomotive Company. Mr. Duck organized the service department of the company and put it on its present basis, establishing systems that are being followed generally by other concerns. He was formerly branch manager for the Matheson Automobile Company before joining the Alco concern.

The Henderson Motor Car Company, Indianapolis, Ind., announced its 1914 line of Henderson cars during the progress of the recent 500-mile race, the new models being displayed in the Hotel Claypole. An accompanying illustration presents the exhibit, which attracted not a little favorable comment from all who saw it.

The Bosch Magneto Company, New York City, announces the following Bosch distributors: Oskamp Auto Supply Company, Race and Seventh streets, Cincinnati, O.; Gus Habich, 142 East Washington street, Indianapolis, Ind.; Kimball-Upson Company, 609-611 K street, Sacramento, Cal. The following Bosch supply stations have also been designated by the company: S. S. Parmalee Company, Second and Poplar streets, Macon, Ga.; Lackawanna Automobile Company, 314 Adams avenue, Scranton, Penn.; Armstrong Auto Company, St. Joseph, Mo.; Electric Manufacturing Company, St. Paul, Minn.; Edwards & Dickey, 13 Vaughan street, Portsmouth, N. H.; Susquehanna Motor Car Company, Wilkesbarre, Penn.; John F. Esser, 58 Broadway, Flushing, N. Y.; Spokane Cycle & Supply Company, Spokane, Wash.

The Adams Bros. Company, Findlay, O., maker of Adams trucks, has appointed the following agencies: Holcomb Company, New Haven, Conn.; Fisher & Lambing, Kittanning, Penn.; Charles R. Roehl, Caracas, Venezuela; Cuba Electric Supply Company, Camajuani, Cuba.

The Cole Motor Car Company, Indianapolis, Ind., maker of Cole cars, has designated the following distributors: Ellingson Bros., Sioux Falls, S. D.; De Smet Auto Company, De Smet, S. D.; Gas Belt Auto Company, Pierre, S. D.; H. J. Hooper, Mitchell, S. D.; Abel Mitchell, Madison, S. D.; S. L. Canevascini, Petaluma, Cal.; Clayton & Donahay, Freehold, N. J.; Laing Machine-Auto Repair Company, Plainfield, N. J.; Leon M. Bolter, Grand Rapids, Mich.; E. A. Landes, Hastings, Neb.; Sellick Bros., Edmonton, Alberta, Can.; Edward Klein, Farmington, Mo.; E. J. Love Motor Company, Raton, N. M.; A. M. Urquhart, Huron, S. D.; Thomsen Bros., Round Lake, Minn.

The Keeton Motor Company, Detroit, maker of Keeton cars, has announced the opening of its 1914 season and the following distributors have been appointed: H. A. Dougherty, 1525 Grand avenue, Kansas City, Mo.; John A. Bender Company, 2807 Michigan avenue, Chicago; Lin-

coln Automobile Company, Lincoln, Neb.; G. N. Jordan, 310 Union Oil building, Los Angeles, Cal.; C. Thompson, Rochester, N. Y.; L. Streuberm, Erie, Penn.; W. B. Doan, 643 Washington avenue, Brookline, Mass.; Davenport Automobile Company, Davenport, Ia.; Southern Motors Company, Jacksonville, Fla.; Usborne & Whitson, Ltd., Woodward avenue, Detroit; Engineers Podrowsky & Feyerabend, Sagorondy 21, St. Petersburg, Russia; J. Azevedo & Cia, Rua dos Ourives, 45, Rio de Janeiro, Brazil.

The Franklin Automobile Company, Syracuse, N. Y., has named the following dealers as its representatives: Franklin Motor Car Company, Spokane, Wash., and Walla Walla, Wash.; Franklin Motor Car Company, 3340 Main street, Kansas City, Mo.; Jacob Struhldreher, Youngstown, O.

The Chandler Motor Car Company, Cleveland, O., which was recently formed to manufacture the Chandler car, has announced the following appointments of distributors of its product: C. S. Ransom, Albany, N. Y.; Charles R. Fluke, Altoona, Penn.; Cole Motor Sales Company, Baltimore, Md.; Chandler Motor Car Company of New England, Boston; J. N. Bulkley, Bridgeport, Conn.; Tanner Motor Car Company, Brooklyn, N. Y.; Iowa Motor Sales Company, Cedar Rapids, Ia.; S. H. Stern, Chicago; J. L. Russell, Chicago; Lozier Sales Company, Cleveland, O.; Jenkins & Co., Des Moines, Ia.; Grant Bros., Detroit; Stirling Bros. Company, Erie, Penn.; Brant Bros., Indianapolis, Ind.; Burke Bros. Company, Jersey City, N. J.; Sparks-Miller Motor Company, Los Angeles, Cal.; Blomberg Auto Company, Memphis, Tenn.; Archambault Motor Sales Company, Milwaukee, Wis.; Whiting Motor Company, Newark, N. J.; Holcomb Company, New Haven, Conn.; Brady-Murray Motors Corporation, New York City; W. L. Huffman, Omaha, Neb.; John Van Benschoten, Poughkeepsie, N. Y.; Chandler Motor Car Company, Philadelphia, Penn.; Whiting Motor Car Company, Philadelphia, Penn.; Strong Crittenden Company, Rochester, N. Y.; E. C. Eads, St. Joseph, Mo.; Overland Auto Company, St. Louis, Mo.; S. G. Chapman, San Francisco, Cal.; Conrad-Chandler Motor Car Company, Scranton, Penn.; Clayton Gibson, Seattle, Wash.; R. A. McKee, Springfield, Mass.; Miller Company, Washington, D. C.; Central Auto & Supply Company, Waterloo, Ia.; Wilmington Automobile Company, Wilmington, Del.; Canadian Motor Car Company, Ltd., Winnipeg, Can.; W. J. Woods, Worcester, Mass.; Standard Automobile Garage, Uniontown, Penn.; Hoffmeister Bros., Vancouver, B. C.

F. E. Wilson has severed his connection with the Tone Car Corporation, Indianapolis, Ind. maker of Tone cars, and has joined the sales force of the Marathon Motor Works, Nashville, Tenn., maker of Marathon cars. His headquarters will be at Dallas, Tex.

Production Manager Max Wollering of the Studebaker Corporation, who was reported to have joined the Maxwell Motor Company in a similar capacity, denies the report and states he will not break his long term contract with the Studebaker concern.

Exhibition of 1914 Henderson Models at Hotel Claypole, Indianapolis, Ind., During the Recent 500-Mile Race, by the Henderson Motor Car Company of That City.

GARAGE AND DEALER.

The Automobile Accessories Company, of which William P. Yost is president, has opened its new headquarters at Grant boulevard and Craig street, Pittsburg, Penn.

The Boston Automobile Dealers' Association at its annual meeting elected the following officers: President, J. H. MacAlman; vice president, J. S. Hathaway; treasurer, F. A. Hinchcliffe; secretary, Chester I. Campbell; directors, J. H. MacAlman, J. S. Hathaway, F. E. Wing, C. E. Fay, J. W. Bowman, E. A. Gilmore, F. A. Hinchcliffe, C. P. Rockwell and J. W. Maguire.

E. C. Morton, formerly with the Automobile Accessories Company, Pittsburg, Penn., is now with the Pittsburg Auto Equipment Company. He has taken charge of the new branch store recently opened at Grant boulevard and Ridge street.

Harry Branstetter, who was until recently assistant manager of the KisselKar Company at Chicago, has taken charge of the branch at Kansas City of the Cole Motor Car Company, Indianapolis, Ind., maker of Cole cars.

Thomas Hustwick, formerly connected with the Oldsmobile branch at Boston, has transferred his interests to the Oakland Motor Company in that city.

Moore & Bearce, conducting the Central garage at Tulare, Cal., has dissolved, the interests of both parties being taken over by J. H. Scott, who will conduct the business along former lines.

Harry Nestlewode, Fostoria, Ia., has taken over the garage business and Oakland agency, conducted under the name of Nestlewode Bros., Charles Nestlewode having retired from the business.

P. J. Hurley, formerly a real estate dealer, has purchased the White garage at Ft. Madison, Ia., and has taken possession. He will conduct a garage and repair shop.

The New York Sales Company, Binghamton, N. Y., has formally opened its new $35,000 garage at State and Collier streets. The company handles Cole, Hudson, Paige and Chevrolet cars and carries a line of accessories and supplies for these machines.

The Carolina Motor Company is erecting a garage on Broad street, and N. W. Fox is having one erected on North Center street, both at Salisbury, N. C.

A. E. Stegerm, formerly with the United Garage Company, Toledo, O., has leased the ground floor of the Meredith building on Jefferson avenue and Michigan street and will operate a garage under the name of City garage. The building is being remodelled.

RECENT PATENTS.

Oil Spraying Apparatus, Franklin C. Pillsbury, Boston, assignor to Walter Cressy, Gloucester, Mass., No. 1,062,029. The combination with a tank wagon having a discharge pipe and a valve in said pipe, of a spray pipe communicating with the discharge pipe, a steam pipe communicating with said discharge pipe intermediate the valve and the tank whereby steam may be admitted to the tank through the discharge pipe, a steam pipe communicating with said discharge pipe in rear of the valve whereby steam may be blown through the spray pipe, and means for applying a pressure to the tank above the liquid therein.

Dirigible Headlight, Louis Marcel Gabriel Lourdin, Paris, France, No. 1,062,883—A dirigible headlight comprising in combination a lamp having trunnions, a revoluble fork having bearings for said trunnions, a revoluble shaft near the end of said fork, a pinion on one of said trunnions, a pinion on said revoluble shaft, connections between said pinions, a second shaft mounted so as to be capable of both swinging and revolving on its axis, and a cardan joint connecting said shafts, substantially as described.

Automobile, Fred Drew, Boston, No. 1,062,898—The combination with the body of an automobile having front and rear seats and side doors, of a collapsible cover secured to the back of the front seat and arranged when extended to inclose the space between the front and rear seats to form a storage space, means whereby the collapsible cover may be locked in operative position, and securing means for the doors inaccessible when the cover is extended.

Automobile Tire, William F. Haas, Hartford, Conn., No. 1,063,196. A tire or shoe comprising superposed layers of endless, circular, knitted bands, each without lap or seam, said bands being formed of a continuous thread or yarn knitted in a circle of a diameter substantially the same as the diameter of the tire or shoe, and having the ribs or chain of the knitting stitch extending transversely of the bands, whereby the threads or yarns are not severed at the edges of the bands, and a resilient cementing compound impregnating the superposed bands.

Crankshaft, Henry L. Bock, Toledo, O., assignor to William L. Bock of the same city, No. 1,063,323. A crankshaft having a multiple section sheet metal crank arm, the sections being secured together to form a space therebetween, one of said sections having an outwardly drawn hollow shaft part and another having an outwardly drawn hollow wristpin part, with each of said parts in communication with said space.

Clamp, Jacob Diehl, Sheboygan, Wis., No. 1,063,332. A C clamp, having a screw fitted in one terminal, an abutment plate connected to the screw by a ball and socket joint, two plates connected together and having terminal straddling lugs pivoted astride the other terminal of the clamp for back and forth swinging movement relatively to the abutment plate of the screw, and two abutment plates connected each by a ball and socket joint to the two swinging plates and for co-operation with the abutment plate of the screw.

Valve Mechanism, Oscar Treier, Brooklyn, N. Y., No. 1,063,477. In a valve mechanism for engines the combination with the engine cylinder having an admission and outlet passage, of a tubular valve chamber, having an admission opening at one end, an exhaust opening at the other and circumferential openings in alignment with the said passage, a tubular valve body slidably mounted in said chamber and having circumferential openings, the inner end of said valve body being tightly closed and the outer end thereof being open, a nozzle in the interior of said tubular valve directed toward the said closed end of the latter, said valve being adapted to alternately establish communication between the said cylinder and the said chamber to permit the fuel to exhaust, and between its interior and the said cylinder to admit fresh fuel.

COMING EVENTS.

July.

July 1—Manufacturers' tour, Indianapolis-San Francisco.
July 4—200-mile race, Columbus, O.
July 4—Track meet, Taylor, Tex.
July 4—Panama-Pacific road race, Los Angeles, Cal.
July 4—Track meet, Washington, D. C.
July 4-5—Track meet, Sioux City, Ia.
July 4-6—Road race, Tacoma, Wash.
July 11-19—A. A. A. tour, Minneapolis-Glacier Park.
July 20—Track races, Seattle, Wash.
July 21-25—Tour, Seattle, Wash.
July 27—Tour, Grand Rapids, Mich.
July 27-28—Road races, Tacoma, Wash.
July 28-30—Beach races, Galveston, Tex.

August.

Aug. 12—Reliability run, Kansas State Automobile Association.
Aug. 29—Chicago Trophy race, Elgin, Ill.
Aug. 30—Elgin Trophy race, Elgin, Ill.
Aug. 30-Sept. 6—Reliability tour, Chicago, Ill.

September.

Sept. 1—Fire chiefs' convention, Madison Square Garden, New York.
Sept. 1—Track races, Columbus, O.
Sept. 12—Track races, Youngstown, O.

October.

Oct. 4-11—Around Lake Michigan tour, Chicago Motor Club.

November.

Nov. 24—Vanderbilt Cup race, Savannah, Ga.
Nov. 26—Grand Prize race, Savannah, Ga.

FOREIGN.

July.

July 1-16—Plowing competition, Winnipeg, Manitoba.
July 12—Grand Prix race, Amiens, France.
July 19-20—Grand Prix race, Belgium.

August.

August 10—Hill climb, Mount Ventoux, France.
August 15—Hill climb, Tonale, Italy.

September.

September 28—Hill climb, Mont Verdun, France.

NEW PUBLICATIONS RECEIVED.

Arizona Tour Book—Compiled and published by Harry Locke for the Arizona Good Roads Association, Prescott, Ariz. Contains 200 pages of detailed information concerning road conditions, touring maps, routings, etc., covering the state. Fully illustrated. Price $2.

The Ideal Tour—Compiled and published by Almon C. Judd, The Elton, Waterbury, Conn. Illustrated routings for the so-called Ideal Tour of New England, occupying 11 days, with connection from the West and South, fully revised and brought up-to-date. Mailed free upon request.

Pastime Journeys for Electric Automobiles—Published for the Electric Motor Car Club of Boston by F. D. Stidham, 138 Pearl street, Boston. Contains a series of routes with Boston as a centre, practical for electric automobiles, with charging stations in the various cities indicated.

Gas Engines and Producers—Comprises three parts, the first two being devoted to gas and oil engines, by Lionel S. Marks, S. B., M. M. E., and the last taking up gas producers, by Samuel S. Wyer, M. E. A treatise on the modern development of the internal combustion motor and of efficient methods of fuel economy and power production. Fully illustrated. Published by American School of Correspondence, Chicago. Price, $1.

Electric Vehicles—Published by the Electricity Magazine Corporation, Monadnock building, Chicago, now incorporated with Ignition. The May number contains the following articles of special interest: "The Electric Vehicle Association of America," S. F. McIntyre; "Co-Operation in Electrical Vehicle Progress," Arthur Williams; "Charging Your Own Car," John B. Rathbun; "How a Woman Sells Electrics," Mabel Condon; "Some Facts About Storage Battery Electrolyte," Hudson F. Smith; "Up-Keep Cost, Horse Drawn vs. Electric Vehicles," W. R. Metz; "Some Recent Electric Truck Applications," Fred W. Harrington; "Significance of Electric Truck Recorders," E. E. Witherby, and the electric pleasure car specifications for 1913.

ROADS CONGRESS IN DETROIT.

Annual Convention of National Bodies to Meet There in September.

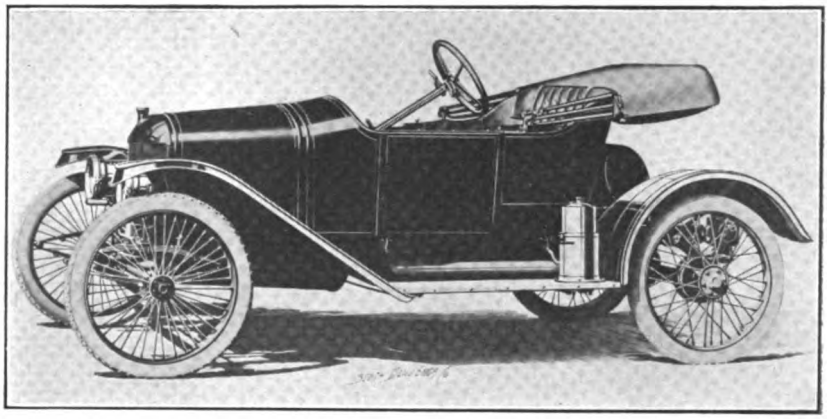
The American road congress will hold its third annual meeting at Detroit during the week of Sept. 29. This decision was reached by the joint committee of which Logan Waller Page, director of the United States office of public roads, is chairman, after a spirited contest which finally narrowed down to the cities of St. Louis, Denver, Minneapolis and Detroit.

The congress is the great national assemblage of the good roads organizations throughout the United States and is held under the direction of the American Highway Association, American Automobile Association and the National Association of Road Machinery & Material Manufacturers, the latter organization being concerned primarily with the exposition of machinery and materials held in conjunction with the congress.

As there are between 30 and 40 state and interstate organizations identified with the American Highway Association in addition to its 1800 regular members, the big meeting will be thoroughly representative in character. Arrangements have been made to hold the annual meeting of the Michigan State Good Roads Association, which has 15,000 members, the newly formed Michigan Trunk Line Association, and the Ontario Good Roads Association, in connection with the congress. The combined attendance of these various organizations will be well over 5000 and will set a record far in advance of attendance figures at any previous good roads meeting held in the United States.

PLANNING OWNERS' EVENT.

Manhattan Automobile Club Would Hold Contest on Prince Henry Tour Rules.



The Manhattan Automobile Club, New York City, which is coming to the front as an active organization in the motor world, is planning for some time in September a tour intended primarily for owners of motor cars rather than for the trade. Work on this is to be started soon. If there is a trade division it is stated that it will be kept entirely separate.

If such an event is held it is planned to have it on lines of the Prince Henry tour abroad, in which many distinguished car owners have competed. It has been recommended that there be some sort of time regulation based on an observation of the speed laws, so that the tour will not be a race, as it might be with go-as-you-please regulations and no penalty except for failure to arrive on time.

THE NEW GRANT CAR.

Uses Four-Cylinder, 15 Horsepower Engine and Weighs but 930 Pounds.

Announcement of the organization of the Grant Motor Car Company, Detroit, is made elsewhere in this issue, and an accompanying illustration presents the product of the concern. The new Grant car is small in size, having a wheelbase of only 90 inches, although the tread is standard, 56. The weight is very light, being but 930 pounds.

The New Grant Car, Rated at 15 Horsepower and Weighing 930 Pounds.

The motor is a four-cylinder unit of the long stroke type rated at 15 horsepower, and is made especially for this machine. The clutch is a cone member and the transmission is incorporated with the rear axle. The driver is placed at the left with the control levers in the centre. Wire wheels are fitted as standard equipment.

The machine is no sense a new product, the first model having been produced by the designer, George Salzman, in Mishawaka, Ind., about a year ago, and having undergone severe road tests since that time. It is understood that it has been passed upon by a number of automobile engineers who predict a satisfactory future for it.

LIGHTS ON MUDGUARDS.

New Pierce-Arrow Cars Inaugurate an Innovation in This Respect.

The value of the headlight lies in its ability to so project the beam of light that the driver is enabled to see the road ahead as well as to completely illuminate the sides of the roadway. The Pierce-Arrow Motor Car Company, Buffalo, N. Y., maker of the Pierce-Arrow car, believes it has solved this problem in the most efficient manner by placing the headlights on its new models directly on the mudguards.

An accompanying illustration shows the arrangement, and also indicates its value in illuminating the curves. The two photographs, which are presented here side by side, were taken at the same spot, the first in the daytime and the other at night. The curve is 750 feet from the car.

Showing Efficiency of Headlights Incorporated with the Mudguards on New Pierce-Arrow Cars, the Two Photographs Being Taken at the Same Point.

SPLITDORF DURING THE RACE.

Maker States That All Cars Thus Equipped Came Through Without Trouble.

According to the Splitdorf Electrical Company, Newark, N. J., maker of the Splitdorf magneto and spark plugs, misleading newspaper reports, arising through the lack of authoritative information as to the ignition equipment on several cars taking part in the Memorial Day 500-mile race on the Indianapolis speedway, have created a false impression as to the performance of machines equipped with Splitdorf ignition. It adds that all cars in the event thus equipped came through without the suggestion of ignition trouble, their failure to win out being attributable to divers other causes.

Louis Disbrow, who drove the Case so masterfully, and who was in the lead of the Splitdorf equipped machines at the finish, covers the situation, insofar as Splitdorf ignition is concerned, when he says: "The Splitdorf magneto in the race gave the perfect satisfaction that it has always given me during my five years of racing."

THOSE BRAENDER TIRES.

Additional Evidence of the Manner in Which They Withstood Racing Test.

The Braender Rubber & Tire Company, Rutherford, N. J., may be pardoned for again calling the attention of the motoring public to the fact that four of its Braender tires went through the 500-mile race on the Indianapolis motor speedway, Memorial Day, without change. The following extract appeared in the report of the race written by a member of the staff of the Indianapolis Star, who has witnessed all the 500-mile events:

> Such a record speaks volumes for the car and casts much credit on the driver, but the real glory of the epoch-making performance goes to the tires. Three 500-mile races have been held in Indianapolis. In the first two events cars were few which even carried one casing throughout the grind. Dawson did it in the second race and the occurrence received much comment. This year the record of having the same four tires which started the race and finished it was made.
>
> Too much cannot be said for a tire which will withstand 500 miles of the hardest usage to which rubber can be subjected. The feat approached the marvelous. Starter Root, when seen yesterday noon, asserted that he looked at the tires at the finish of the race, and they showed little sign of wear. "Never in my life," he said, "have I seen tires withstand such a strain."

NATIONAL RELIABILITY RUN.

Expected That at Least 50 Cars Will Take Part in Next Month's Contest.

It is anticipated that fully 50 cars will take part in the contest for the new A. A. A. trophy in the national reliability tour of the American Automobile Association from Minneapolis to Glacier national park, July 11-19. Already it is announced that some 30 entrants have filed application with Dr. C. E. Dutton, chairman of the touring board.

The tour will be novel in a number of respects, but chiefly from the fact that it will be the first in which American Indians have competed. It also will be the initial appearance of a Canadian as a contestant, an entry having been received from a resident of Fort William, Ont. Several women will drive their own cars. The full list of entrants is not ready for publication, but contains the following:

C. H. Metz, C. Walter Metz and George H. Voter, representing Boston, Metz cars; Louis W. Hill, chairman of the board of directors of the Great Northern Railroad; Reuben Warner, H. C. Irvine and W. A. Ramaley, St. Paul; Dr. J. D. Park, Duluth; J. A. Bailey, Alexandria, Minn.; C. E. Christman, Ortonville, Minn.; L. M. Bolter, Grand Rapids, Mich.; G. E. Raymond, Asa Paine, Charles Gates, F. C. Legg, F. M. Mapes and C. E. Van Duzee, Minneapolis; O. R. Brictson, Brookings, S. D.; Mrs. Lillian Mendel, Mt. Vernon, N. Y.; Mrs. Dudley Hershey, Minneapolis; Long Time Sleep, Glacier Park reservation; Horse's Ghost, Ft. Peck reservation.

BOSTON'S CHILDREN'S DAY.

Sixth Annual Outing for Crippled and Orphaned Girls and Boys.

More than 3000 children, crippled or orphaned, inmates of Boston institutions, were given an outing at Nantasket beach June 11. The generosity of the Boston motor dealers and owners of cars, as well as a number of public spirited people who assisted with cash donations, made the outing possible. It was the sixth annual outing under the direction of the Boston Automobile Dealers' Association, Inc., and was under the personal management of Chester I. Campbell, secretary of the association, who has also had charge of previous events.

The children were given every opportunity to enter the water and enjoy other sports arranged for them. The dinner at the pavilion was a real treat and consisted of all the good things usually found at the shore. Many of them had never before ridden in a motor car or seen the ocean and it is safe to say that all will cherish in their hearts a warm feeling for the Boston automobile dealers even after they shall have grown to the adult state.

IMPORTS AND EXPORTS.

Figures for Month of April as Reported by the United States Government.

The exports of American automobiles for April exceeded those of the same month a year ago, while the imports showed a corresponding decrease. The following are the figures as prepared by the Department of Commerce of the United States:
